Cancer Incidence in Five Continents

Volume IX

INTERNATIONAL AGENCY FOR RESEARCH ON CANCER

The International Agency for Research on Cancer (IARC) was established in 1965 by the World Health Assembly, as an independently financed organization within the framework of the World Health Organization. The headquarters of the Agency are at Lyon, France.

The Agency conducts a programme of research concentrating particularly on the epidemiology of cancer and the study of potential carcinogens in the human environment. Its epidemiological studies are supplemented by studies of the mechanisms of carcinogenesis carried out in the Agency's laboratories in Lyon. The promotion of collaborative research among scientists worldwide is a strong feature of the Agency's activities. The Agency also conducts a programme for the education and training of personnel for cancer research.

The publications of the Agency are intended to contribute to the dissemination of authoritative information on different aspects of cancer research. A complete list is printed at the back of the book. Information about IARC publications and how to order them is also available via the Internet at: **http://www.iarc.fr/**

INTERNATIONAL ASSOCIATION OF CANCER REGISTRIES

The International Association of Cancer Registries (IACR) was created following a decision taken during the Ninth International Cancer Congress held in Tokyo, Japan, in 1966. The Association is a voluntary non-governmental organization in official relations with WHO, representing the scientific and professional interests of cancer registries, with members interested in the development and application of cancer registration and morbidity survey techniques to studies of well-defined populations.

The constitution provides for a Governing Body composed of a President, General Secretary, Deputy Secretary and nine regional representatives. From 1973 the IARC has provided a secretariat for the Association with the primary functions of organizing meetings and coordinating scientific studies. Information about the Association, including membership, activities and publications, can be found on the Internet at: **http://www.iacr.com.fr/**

Cancer Incidence in Five Continents Volume VIII: Errata 895

Foreword

It is difficult to estimate the number of people around the world who work diligently to collect the data that are presented in *Cancer Incidence in Five Continents*. One thing is clear: it is a large number. Surgeons, oncologists, pathologists, radiologists, radiotherapists, epidemiologists, statisticians, coding clerks and many other staff from different specialist backgrounds engaged in medical practice and medical records contribute to the accurate diagnosis and coding of cancer.

Their combined work is summarised in the pages of this volume. *Cancer Incidence in Five Continents* (CI5) has become the recognised reference source on the incidence of cancer in populations around the world. The ninth volume has a wider coverage than before presenting data from around the year 2000 (ideally the period 1998–2002) not only for entire populations but also for sub-populations living in the same geographic area.

This volume presents incidence data from populations all over the world for which good quality data are available. Scanning through the information gives a clear presentation of the changing cancer patterns worldwide. The nine volumes of *Cancer Incidence in Five Continents* now cover a period of approximately forty years. These new data are meant to be used and be useful. Looking ahead, with the rapidly rising cancer burden in low-income and medium-income countries, more high-quality incidence data are needed from regions and countries in such settings. Reliable data are needed to establish the cancer burden and to monitor its evolution in all parts of the world, particularly in response to cancer control activities. Nurturing the development of cancer registration in such countries is of major importance and one issue that the International Agency for Research on Cancer is addressing.

On behalf of the International Agency for Research on Cancer, and the Editors, I would like to acknowledge the fruitful collaboration with the International Association of Cancer Registries, and IARC looks forward to the continual development of this collaboration. It is also a pleasure to acknowledge the directors and staff of all the registries who submitted their data, and responded to their series of questions and clarifications. Without their great efforts and dedication, information on the incidence of cancer, as made available in this volume, would not be available to all those concerned in the fight against cancer.

Contributors

Note: The contributors to this volume are listed below. Their names are given as communicated to the editors, hence the lack of consistency in presentation.

Without the patient cooperation of the contributing registries, the editors of this monograph would have had no material to edit. The editors hope that scientists will give due recognition to this fact and use the following style of reference when quoting the data from a given registry:

NORTH, A.B., SOUTH, C.D. Cancer Incidence in Antarctica, 1998-2002. In: Curado. M. P., Edwards, B., Shin. H.R., Storm. H., Ferlay. J., Heanue. M. and Boyle. P., eds (2007), Cancer Incidence in Five Continents, Vol. IX, IARC Scientific Publications No. 160, Lyon, IARC.

Chapter 1: Introduction

M.P. Curado, H.R. Shin and J. Ferlay

Cancer Incidence in Five Continents (CI5) Volume IX presents incidence data from populations all over the world for which good quality data are available.

Background

A detailed questionnaire was requested to be completed by all cancer registries that were able to contribute to Volume IX and also by national registry associations and networks. The registries could delegate data submission to their associations but had to submit their own questionnaires. All instructions for preparing the data were explained in the questionnaire and an email address, CI5-IX@iarc.fr, was expressly created to handle all correspondence relative to the preparation of this volume.

The reference time period for Volume IX was defined to be 1998–2002; in order to allow the Editors to verify some aspects of quality, comparability and completeness for each submission, the contributors were asked to also send data for the years prior to the reference period.

The publication

The data presented in Volume IX are expanded on by seven introductory chapters, reduced from nine in the previous volume: this Introduction, Techniques of registration; Classification and coding; Histological groups; Comparability and quality of data; Processing of data; and Age standardization and denominators. The evaluation criteria used to analyse the data submitted by the cancer registries were based on *Cancer Registration, Principles and Methods* (IARC, 1991).

We received data from 406 cancer registry populations (Table 1.1). Data submitted on 106 populations from cancer registries were excluded. Volume IX thus presents cancer incidence data from 300 populations, 225 cancer registries and 60 countries, an increase of 28.6% over Volume VIII.

Table 1.1 Cancer population data submitted to CI5 Volume IX for the period 1998–2002

	Submitted	Accepted
Countries	80	60
Registries	313	225
Populations	406	300

Geographical coverage in CI5 Volume IX

The geographical coverage of CI5 Volume IX by continent is shown in Table 1.2 below: Africa has included data from 5 of the 14 countries that submitted data, South and Central America 8 of 11, North America 2 of 2 countries, Asia 15 of 18, Europe 29 of 30 countries and Oceania 4 of 6 countries.

The proportion of cancer registries represented by continent is as follows: Africa 31% (5/16), South and Central America 38% (11/29), North America 93% (54/58), Asia 57% (44/77), Europe 83% (100/120) and Oceania 85% (11/13).

The share of the world population covered in this volume is 11%, distributed as follows: Africa: 8.8 million (1%), South and Central America: 23 million (4%), North America: 258.5 million (80%), Asia: 152.3 million (4%), Europe: 238.8 million (33%) and Oceania: 23 million (73%).

Table 1.2 Geographical coverage by country, registry and population group

	Countries		Registries		Populations	
	Submitted	Accepted	Submitted	Accepted	Submitted	Accepted
Africa	14	5	16	5	16	5
South and Central America	11	8	29	11	29	11
North America	2	2	58	54	136	118
Asia	18	15	77	44	84	50
Europe	30	29	120	100	123	100
Oceania	6	4	13	11	18	16
Total	80	60	313	225	406	300

Note: The sum of the individual countries is greater than the total, reflecting the fact that some countries are present in more than one continent

Geographical coverage in the nine successive volumes of *Cancer Incidence in Five Continents*

Tables 1.3 and 1.4 and Figure 1.1 outline the overall geographical coverage in terms of the number of registries, populations and countries included in each volume of CI5.

Table 1.3 Coverage in nine volumes of *Cancer Incidence in Five Continents*

Volume	Year of publication	Registries	Populations	Countries	Period (approx.)
I	1966	32	35	29	1960–1962
II	1970	47	58	24	1963–1967
III	1976	61	79	29	1968–1972
IV	1982	79	103	32	1973–1977
V	1987	105	137	36	1978–1982
VI	1992	138	166	49	1983–1987
VII	1997	150	183	50	1988–1992
VIII	2002	186	214	57	1993-1997
IX	2007	225	300	60	1998-2002

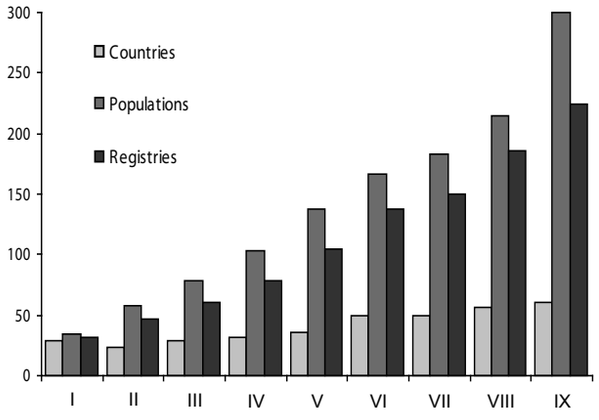

Figure 1.1 Coverage in nine volumes of *Cancer Incidence in Five Continents*

This publication was developed via an interactive relationship among the contributors and the editors mainly through the power of the electronic presentation of data, while retaining the traditional tables of incidence rates and registry descriptions as in previous editions. The website http://www-dep.iarc.fr/ provides multiple options for analysis of cancer incidence across the world, in order to be beneficial to epidemiologists, oncologists, researchers and cancer policy makers.

Acknowledgments: The Editors would like to thank Vincent Benoist and Marilyne Goutagny, who abstracted and tabulated the information from the questionnaires completed by each contributor, and Krittika Guinot, who created the maps. The Editors would also like to thank the directors and registrars from all the cancer registries who submitted their data to this volume for their efforts to produce cancer incidence data and make it available to the world. Their work is the cornerstone of cancer descriptive epidemiology and provides a basis for future cancer research and health policies.

Chapter 2: Techniques of registration

M.P. Curado

The quality of the cancer database in a cancer registry rests not only upon the quality of its sources of information but also upon the registration techniques adopted by the cancer registration team. If these techniques follow the international rules of cancer registration, populations may be compared with confidence. This chapter describes the variation between registries in the methods used to collect data on new cancer cases and on the population at risk in the geographical area covered by the cancer registry.

Registry background

The background of each cancer registry is relevant to the information it delivers. These definitions could affect the data, potentially resulting in an under- or over-reporting of cases. Each point of this issue is discussed briefly below.

Table 2.1 presents a definition of the area covered by the cancer registry. This includes its population, surface area, latitude, the year the registry started, the year population-based data became available, and whether cancer is reportable by L (Legislation), A (Administrative), N (Not reportable) or M (Mixed, a combination of the above). Other variables presented include the percentage of cases treated outside the registration area and the percentage of non-residents treated in the registration area. These topics are discussed in greater detail below.

Populations. The denominator used to calculate rates generally comes from official census data. Rates based on interpolations between censuses tend to be better than projections since the last census. The absolute size of the populations on which the rates are based affects the accuracy of the estimated rates. Rates based on small numbers are more subject to random variation than are rates based on large populations.

Surface area. The population density is calculated by each registry based on the population estimates from the surface area.

Latitude. This localises the position of the cancer registry and enables comparison within the same region.

Year registry started and Year population based data available. To get good-quality data in cancer incidence takes time. For instance, data from new cancer registries should be viewed with some caution, because in the first years of data collection the rates can be underestimated (due to over selectivity causing under collection) or overestimated (due to conflation with already-existing cases).

Cancer reportable. This is a tool used to get a better picture of completeness in cancer registration. The presence of laws and rules that make cancer diagnosis a reportable disease can ensure completeness of the registry data collection, especially in countries where the cancer registry is part of an integrated cancer control programme.

Percentage of cases treated outside the area. If the area covered by the population cancer registry has limited facilities for cancer diagnosis and care, such as surgery, radiotherapy, chemotherapy and pathology laboratories, it will be quite difficult for the cancer registry to get completeness in the area, as the residents with a suspicion of cancer will seek treatment outside the catchment area. Patients may also die outside the catchment area, or even return to die at home after having being diagnosed elsewhere, thus causing underestimation of the local incidence rates.

Percentage of non-residents treated inside the area. If the catchment area has a cancer care centre with a good reputation and treatment and diagnosis facilities available to the population, there may be an increased number of non-residents being treated in the same area as the resident cases. If these non-resident cancer cases are included in the cancer registry database, the local rates may be overestimated.

Case finding

If the geographical area covered by the cancer registry includes cancer centres and radiotherapy services, or any type of oncology or onco- haematological treatment and diagnosis centres such as pathology laboratories where cases can be microscopically verified, this can improve data quality in cancer diagnosis, and is also an important source of quality data on local health services. The main sources of cases are described in Table 2.2.

Data Sources. These sources include hospital in-patient records, radiotherapy departments, public and private hospitals and their in- and out-patient facilities, pathology laboratories, autopsies, haematology laboratories, death certificates and screening programmes.

Abstraction and coding. This details the proportion of manual abstraction and coding of cancer information done by trained cancer registry personnel. Nowadays some cancer registries have automatic registration for which cancer registry personnel must verify the data quality and comparability.

Information recorded

Table 2.3 presents the information recorded by the population-based cancer registry. This is the most relevant information that should be collected by the cancer registries: Basic information includes name, sex, date of birth or age, and usual resident address (permanent) of each patient, which enables personal identification. Further information collected includes ID number; ethnic group/race/colour; incidence date, stage of disease; nature of the first treatment; brain and nervous system; follow–up for vital status (all/selected/none); death certificates used to update vital status; and active follow-up of the alive cases.

Basic information includes name, sex, date of birth or age, and permanent address of the patient. These items are essential for establishing the patient's background in the cancer registry database, precluding double entry of the same case in the registry.

Incidence date includes the date of diagnosis or hospitalisation for first treatment, as well as if possible the primary site and histological type of the cancer diagnosed. It must be coded according to ICD-O-3 (see Chapter 3).

Date of birth is important to assist identification, particularly where there is limited variation in names, or when other specific identifying information is lacking. For comparability, it is necessary to convert any local dating system to a standard system used internationally.

ID number. Some countries have a number unique to the individual, and others have more than one. The use of these identification numbers varies, but whenever such a number exists, the cancer registry should promote its inclusion in the notification form of the cancer registry, as it can be used to eliminate double notification stemming from using multiple sources of information.

Ethnic group/race/colour. For some cancer registries this is an essential item, because social and cultural differences between groups may be related to the utilisation of medical facilities. It can be an indicator of differences in culture and habits that may determine exposure to carcinogenic factors. The definitions of the ethnic groups used by the cancer registries should be compatible with official definitions used for census reports.

Stage of disease can be identified when the diagnosis is made by the physician, and is a standard data point used to analyse post-diagnosis survival and disease stage. The final evaluation of survival depends upon the topography of the tumour at time of the diagnosis.

Nature of the first treatment. The type of treatment modality reflects the general access to basic treatment modalities (but it cannot be used to assess the efficacy of specific treatment).

Brain and nervous system identifies whether cancer registries include benign cancers of the brain and nervous system or not.

Follow-up for vital status, Death certificates used to update vital status, and Active follow-up of the living cases. The follow-up for vital status is important to evaluate survival after treatment and diagnosis, and it can be done actively through a phone call or visit, or passively by matching death certificates with incidence cases.

Chapter 3: Classification and coding

H.R. Shin

The *Cancer Incidence in Five Continents* series has followed the evolution of the International Classification of Diseases through four revisions and the creation of a coding scheme for oncology, the International Classification of Diseases for Oncology (ICD–O), now in its third edition (ICD–O–3). Volumes I and II (Doll *et al*., 1966; 1970) presented the data on cancer incidence coded to the 7th Revision (ICD–7; WHO, 1957). Volume III (Waterhouse *et al*., 1976) published data using both the 7th and the 8th (ICD–8; WHO, 1967) revisions. ICD–8, which came into effect in 1968, was used in Volume IV (Waterhouse *et al*., 1982), presenting data for the years 1973–77. The 9th Revision of the ICD (ICD–9; WHO, 1977) was used for Volumes V (Muir *et al*., 1987), VI (Parkin *et al*., 1992), VII (Parkin *et al*., 1997), The 10th revision of the ICD (ICD–10, WHO, 1992) was used for Volume VIII (Parkin *et al*., 2002) and the present volume.

The data are published at the level of the 3-character ICD–10 codes in the individual registry tables and, as in previous volumes, some grouping of ICD codes has been used. Malignant neoplasm of gum, floor of mouth and other and unspecified parts of mouth have been put together (ICD–10 C03-C06). Follicular (nodular) non-Hodgkin lymphoma, diffuse non-Hodgkin lymphoma, peripheral and cutaneous T-cell lymphomas and other and unspecified types of non-Hodgkin lymphoma have been combined as Non-Hodgkin lymphoma. Other categories have been combined to correspond to a single three-digit rubric in ICD–10; for example base of tongue + other and unspecified parts of tongue (ICD–10 C01–C02), and rectosigmoid junction and rectum (C19–C20). Myeloproliferative disorders (MPD) including morphology behavior M9950/3, 996_/3, 9975/3 and Myelodysplastic syndromes (MDS) including M998_/3 were separately presented according to the ICD–O–3. Table 3.1 presents the ICD–10 individual site codes, the full ICD–10 titles, the Volume IX groupings and short titles used in the tables of incidence.

Table 3.1 Classification used in incidence tables

Site	Full title	Groupings used in tables	Short title used in tables
C00	Malignant neoplasm of lip	-	Lip
C01	Malignant neoplasm of base of tongue	C01-C02 are grouped	Tongue
C02	Malignant neoplasm of other and unspecified parts of tongue		
C03	Malignant neoplasm of gum	C03-C06 are grouped	Mouth
C04	Malignant neoplasm of floor of mouth		
C05	Malignant neoplasm of palate		
C06	Malignant neoplasm of other and unspecified parts of mouth		
C07	Malignant neoplasm of parotid gland	C07-C08 are grouped	
C08	Malignant neoplasm of other and unspecified major salivary glands		Salivary gland
C09	Malignant neoplasm of tonsil	-	Tonsil
C10	Malignant neoplasm of oropharynx	-	Other oropharynx
C11	Malignant neoplasm of nasopharynx	-	Nasopharynx
C12	Malignant neoplasm of pyriform sinus	C12-C13 are grouped	Hypopharynx
C13	Malignant neoplasm of hypopharynx		
C14	Malignant neoplasm of other and ill-defined sites in the lip, oral cavity and pharynx	-	Pharynx unspecified
C15	Malignant neoplasm of oesphagus	-	Oesophagus
C16	Malignant neoplasm of stomach	-	Stomach
C17	Malignant neoplasm of small intestine	-	Small intestine
C18	Malignant neoplasm of colon	-	Colon
C19	Malignant neoplasm of rectosigmoid junction	C19-C20 are grouped	Rectum
C20	Malignant neoplasm of rectum		
C21	Malignant neoplasm of anus and anal canal	-	Anus
C22	Malignant neoplasm of liver and intrahepatic bile ducts	-	Liver
C23	Malignant neoplasm of gallbladder	C23-C24 are grouped	Gallbladder etc.
C24	Malignant neoplasm of other and unspecified parts of biliary tract		
C25	Malignant neoplasm of pancreas	-	Pancreas
C26	Malignant neoplasm of other and ill defined digestive organs	C26 is included in other and unspecified	

Table 3.1 Classification used in incidence tables

Site	Full title	Groupings used in tables	Short title used in tables
C30	Malignant neoplasm of nasal cavity and middle ear	C30-C31 are grouped	Nose, sinuses, etc.
C31	Malignant neoplasm of accessory sinuses		
C32	Malignant neoplasm of larynx	-	Larynx
C33	Malignant neoplasm of trachea	C33-C34 are grouped	Trachea, bronchus and lung
C34	Malignant neoplasm of bronchus and lung		
C37	Malignant neoplasm of thymus	C37-C38 are grouped	Other thoracic organs
C38	Malignant neoplasm of heart, mediastinum and pleura		
C39	Malignant neoplasm of other and ill-defined sites in the respiratory system and introthoracic organs	C39 is included in other and unspecified	
C40	Malignant neoplasm of bone and articular cartilage of limbs	C40-C41 are grouped	Bone
C41	Malignant neoplasm of bone and articular cartilage of other and unspecified sites		
C43	Malignant melanoma of skin	-	Melanoma of skin
C44	Other malignant neoplasms of skin	-	Other skin
C45	Mesothelioma	-	Mesothelioma
C46	Kaposi sarcoma	-	Kaposi sarcoma
C47	Malignant neoplasm of peripheral nerves and autonomic nervous system	C47+C49 are grouped	Connective and soft tissue
C48	Malignant neoplasm of retroperitoneum and peritoneum	C48 is included in other and unspecified	
C49	Malignant neoplasm of other connective and soft tissue	C49 is grouped with C47	
C50	Malignant neoplasm of breast	-	Breast
C51	Malignant neoplasm of vulva	-	Vulva
C52	Malignant neoplasm of vagina	-	Vagina
C53	Malignant neoplasm of cervix uteri	-	Cervix uteri
C54	Malignant neoplasm of corpus uteri	-	Corpus uteri
C55	Malignant neoplasm of uterus, part unspecified	-	Uterus unspecified
C56	Malignant neoplasm of ovary	-	Ovary
C57	Malignant neoplasm of other and unspecified female genital organs	-	Other female genital organs
C58	Malignant neoplasm of placenta	-	Placenta
C60	Malignant neoplasm of penis	-	Penis
C61	Malignant neoplasm of prostate	-	Prostate
C62	Malignant neoplasm of testis	-	Testis
C63	Malignant neoplasm of other and unspecified male genital organs	-	Other male genital organs
C64	Malignant neoplasm of kidney, except renal pelvis	-	Kidney
C65	Malignant neoplasm of renal pelvis	-	Renal pelvis
C66	Malignant neoplasm of ureter	-	Ureter
C67	Malignant neoplasm of bladder	-	Bladder
C68	Malignant neoplasm of other and unspecified urinary organs	-	Other urinary organs
C69	Malignant neoplasm of eye and adnexa	-	Eye
C70	Malignant neoplasm of meninges	C70-72 are grouped together	Brain, nervous system
C71	Malignant neoplasm of brain		
C72	Malignant neoplasm of spinal cord, cranial nerves and other parts of central nervous system		
C73	Malignant neoplasm of thyroid gland	-	Thyroid
C74	Malignant neoplasm of adrenal gland	-	Adrenal gland

Table 3.1 Classification used in incidence tables

Site	Full title	Groupings used in tables	Short title used in tables
C75	Malignant neoplasm of other endocrine glands and related structures	-	Other endocrine
C76	Malignant neoplasm of other and ill-defined sites	C76 is included in other and unspecified	
C80	Malignant neoplasm without specification of site	C80 is included in other and unspecified	
C81	Hodgkin disease	-	Hodgkin disease
C82	Follicular (nodular) non-Hodgkin lymphoma	C82-C85, C96 are grouped	Non-Hodgkin lymphoma
C83	Diffuse non-Hodgkin lymphoma		
C84	Peripheral and cutaneous T-cell lymphomas		
C85	Other and unspecified types of non-Hodgkin lymphoma		
C88	Malignant immunoproliferative diseases	-	Immunoproliferative diseases
C90	Multiple myeloma and malignant plasma cell neoplasms	-	Multiple myeloma
C91	Lymphoid leukaemia	-	Lymphoid leukaemia
C92	Myeloid leukaemia	C92-C94 are grouped (following ICD-O-3)	Myeloid leukaemia
C93	Monocytic leukaemia		
C94	Other leukaemias of specified cell type		
C95	Leukaemia of unspecified cell type	-	Leukaemia unspecified
C96	Other and unspecified malignant neoplasms of lymphoid, haematopoietic and related tissue	C96 is grouped with C82-C85	
O&U		Includes C26, C39, C48, C76 and C80	Other and unspecified
MPD	Myeloproliferative disorders	Includes ICD-O-3 M 9950/3, 996_/3, 9975/3	Myeloproliferative disorders
MDS	Myelodysplastic syndromes	Includes ICD-O-3 M 998_/3	Myelodysplastic syndromes
ALL			All sites
ALLb			All sites but C44

Classifications used in the cancer registry

Since the publication in 1976 of the first edition of the ICD–O (WHO, 1976) with clearly defined axes of anatomical location, histology and behaviour, international conformity to standard classification systems and coding rules has increased steadily. For data published in Volume IV (1973–77), 90% of registries recorded histological diagnosis; for coding just over one third of the registries used MOTNAC (ACS, 1951; 1968), one third had started to use ICD–O and 12% used SNOP (CAP, 1965). About 75% of contributors to Volume V used ICD–O to code histology, and this figure rose to over 90% for Volumes VI and VII. Four of the 186 contributors to the Volume VIII and only one of the 225 contributors to the present volume did not code their histological data to ICD–O.

Data submitted for the first four volumes of *Cancer Incidence in Five Continents* were sent in tabular format, by sex, site and five-year age group, on tape, diskette or, most frequently, the forms designed for the purpose. The only verification possible was to tally the columns and rows. For the fifth volume, registries were given the opportunity of sending data in the form of a case-listing coded to ICD–9 topography only, or to ICD–9 or ICD–O topography plus ICD–O morphology. A very small minority of registries sent data coded to ICD–O. Contributors to Volume VI were encouraged to send data as a listing of cases, but 24% sent tabulated data. For Volumes VII, VIII and IX, data had to be sent as a case listing. In practice, it was still necessary to ask registries some questions, notably in relation to non-melanoma skin, breast, ovary and bladder cancer.

While the majority of the data submitted for this volume had been coded or converted to ICD–O, registries were asked what classification systems were used for coding data in the registry during the period. Of the 225 registries contributing data to this volume, 202 (89.8%) coded to ICD–O–3 or ICD–O–2 topography and morphology, 29 (12.9%) to ICD–9 or ICD–10 topography and ICD–O morphology, and 4 (1.8%) did not register histology and coded topography to ICD–9 or ICD–10. Seven registries used ICD–O–1 topography and morphology, and one registry coded morphology to MOTNAC with ICD–O–7 topography (Table 3.2).

Table 3.2 Coding practices

Continents (No. of Registries)	ICD-O-3 (T+M)	ICD-O-2 (T+M)	ICD-O-1 (T+M)	ICD-9 + ICD-O-1 (M)	ICD-9 + ICD-O-2 (M)	ICD-10 + ICD-O-2 (M)	ICD-10 + ICD-O-3 (M)	ICD-9	ICD-10	ICD-7+ MOTNAC	Total
Africa (5)	4	1	0	0	0	0	0	0	0	0	5
South and Central America (11)	7	4	0	0	0	0	0	0	0	0	11

Europe (100)	75	12	5	3	1	12	3	2	2	1	116**
Oceania (11)	8	1	0	1	0	1	0	0	0	0	11
Total (225)	178	24	7	5	2	19	3	2	2	1	253

*Total greater than 44 (registries using two systems). **Total greater than 100 (registries using two or three systems).

Table 3.3 presents the summary table of coding practices for the selected sites, carcinoma of bladder, benign tumors of brain and nervous system, borderline tumours of brain, endometrium of uterus, ovary and carcinoma of breast with ductal carcinoma in situ, intraductal and lobular carcinoma in situ. Borderline ovary cancer is no longer behavior /3 according to the ICD–O–3. However, some registries are still coding it as /3. For the comparison of cancer incidence from these selected sites, the coding practices of each registry should be reviewed. Table 3.4a and Table 3.4b present the coding practices recorded in the questionnaires by registry

Table 3.3 Summary table of coding practices for the selected sites

Continents (No. of Registries)	Carcinoma of Bladder		Benign Tumours of Brain and Nervous system	Borderline Tumours			Carcinoma of Breast

Chapter 4: Histological groups

L. Egevad, M. Heanue, D. Berney, K. Fleming, J. Ferlay

Background

The data presented in this edition of *Cancer Incidence in Five Continents* (CI5) are mainly organised according to anatomical site. However, for some sites, the histological type of cancer is particularly relevant clinically and epidemiologically. For practical reasons, detailed data on every available morphological entity cannot be presented or used for longitudinal and geographic comparisons. In the latest editions of CI5, edition VII (Parkin *et al*., 1997) and VIII (Parkin *et al*., 2002), these data were grouped according to histological types as defined in *Histological Groups for Comparative Studies* (Parkin *et al*., 1998), based on the second edition of *International Classification of Diseases for Oncology* (ICD-O-2) (Percy *et al*., 1990). Since then, the second edition has been followed by the third edition (ICD-O-3) (Fritz *et al*., 2000). Furthermore, some cancer classifications have been revised, e.g. through the third edition of the *WHO Classification of Tumours*. Consequently, there was a need to update the Histological Groups for Comparative Studies, and the revised version is presented in this chapter.

General structure

The main structure of the histological grouping is that specific types of malignant neoplasms are listed as well as Unspecified malignant neoplasms (Unspecified cancer in the previous edition), i.e. malignant tumours that are so poorly differentiated that we are unable to classify them in major groups such as carcinoma or sarcoma. Neoplasms that have a specific morphology but are too unusual to be listed among the specific types of malignant neoplasms are lumped under Other specified malignant neoplasm (Other specified cancer in the previous edition). Similarly, under Carcinoma, specific cancer subtypes such as Squamous cell carcinoma and Adenocarcinoma are listed as well as Unspecified carcinoma, i.e. carcinomas that are so poorly differentiated that we are unable to classify them according to histogenetic subtype, while it is still possible to distinguish them from non-epithelial malignant neoplasms such as sarcoma. Morphological codes are listed under the specific types of neoplasms (or carcinoma) and under Unspecified malignant neoplasms (or carcinoma). The remaining codes of neoplasia (or carcinoma) will then automatically be assigned to the Other specified malignant neoplasm (or carcinoma) group.

Sites

For inclusion as a histological group, a cancer type has to be sufficiently common at the site and clinically and epidemiologically relevant. The following 15 sites are included: oesophagus, anus, liver, lung, bone, skin, cervix, corpus uteri, ovary, testis, kidney/renal pelvis, urinary bladder, eye, central nervous system and thyroid, together with the haematological system. Some major cancer sites such as breast and prostate were not included because the vast majority of malignant neoplasms at these sites are adenocarcinomas, and the coding of subtypes of these is not consistent. Compared to the previous edition of *Histological Groups for Comparative Studies*, the anus and skin have been added. The kidney was combined with the renal pelvis because some urothelial carcinomas originating from the renal pelvis are site coded as kidney cancers while others are coded as renal pelvis cancers. Hodgkin disease and leukaemias were lumped together in the haematological system.

Types of neoplasms that are included

The CI5 data include all invasive malignant neoplasms and some non-invasive malignant neoplasms. For most morphology codes, a fifth digit /1 or /2 automatically excludes the data entry. Carcinoma *in situ* is reported to many cancer registries, but is generally not dealt with in this volume, with the exception of urothelial carcinoma *in situ*. A few lesions of borderline malignancy are included, such as low-grade non-invasive papillary transitional cell tumours, which are now designated as Papillary urothelial neoplasia of low malignant potential, PUNLMP (8130/1). Flat carcinoma *in situ* of urothelium (8120/2) and PUNLMP (8130/1, 8130/2) have been grouped with Transitional cell carcinoma in this edition. As the skin has been added to the sites, Basal cell carcinoma is reported as a separate group although many cancer registries do not have statistics on them. Within the 15 tumour sites presented, there are no cases of mesothelioma (ICD-O M905_), Kaposi sarcoma (9140), lymphoma or leukaemia (9590-9989), as these cancers have their own specific ICD-10 codes and are presented separately in the volume.

Morphology codes

Grouping of morphological codes presents several difficulties. The ICD-O system is based on separate site (topography) and morphology (histology) codes that can be combined. Inevitably, in registry data morphology codes may mistakenly have been combined with codes for sites where these entities do not occur or have not been reported yet. Some morphology codes are redundant, i.e. multiple codes can be applied for the same tumour. Other codes are obsolete, i.e. the entities have been renamed or deleted in later revisions of tumour classifications. A major difficulty is the variation in coding precision (specific codes for tumour subtypes vs. comprehensive codes for broad categories such as adenocarcinoma), which limits the utility of detailed codes. An example of this is the kidney tumours where renal cell carcinomas are often coded as renal cell carcinoma, NOS (8312) or adenocarcinoma, NOS (8140), while others are subtyped. Therefore, all of these carcinomas of the kidney are grouped together in this chapter.

Some specified cancer types occur in several organs, but may have different clinical behaviour depending on site of origin. For most sites adenosquamous carcinoma (8560) and mucoepidermoid carcinoma (8430) are included in Other specified carcinoma. An exception is corpus uteri (C54) where these are included in Adenocarcinoma because they are supposed to have similar biology (Zaino *et al*., 1988). Furthermore, squamous differentiation is very common in Endometrioid carcinoma, which makes it difficult to separate between these tumours. Another example is metaplastic carcinoma (8575), which is generally included under Other specified carcinoma. However, for the corpus uteri, it is grouped with Other specified neoplasm because metaplastic carcinoma is considered equivalent with carcinosarcoma on this site (Silverberg *et al*., 1990).

Unspecified carcinoma includes tumours that are coded as Carcinoma NOS, but also some descriptive diagnoses of poorly differentiated cancers. These tumours can be recognised as carcinomas but are too undifferentiated to be further classified according to their histogenetic origin. This group generally includes the morphology codes 8010-8035. An exception is lung tumours,

where Large cell carcinoma is a separate entity in the WHO classification and includes 8010-8012, 8014-8031 and 8035 (Travis *et al*., 2004). The thyroid is another exception where Anaplastic carcinoma also is a specific entity in the WHO classification and includes the morphology codes 8020-8035 (Delellis *et al*., 2004).

Some tumours are evidently miscoded in cancer registry data, because their incidence is far higher than expected. Papillary carcinomas NOS (8050) are listed under Squamous cell neoplasm in ICD-O-3. When used for bladder tumours, most of them are probably miscoded urothelial carcinomas rather than papillary squamous cell carcinomas, and therefore included in the Transitional cell carcinoma group. In the thyroid, it can be assumed that carcinomas that have been assigned the morphology code 8050 are actually papillary carcinomas of the thyroid, and they are therefore included in that category. In the kidney it can be assumed that a majority of tumours with the morphology code 8050 are miscoded papillary renal cell carcinomas, and they are consequently grouped with the Renal cell carcinoma group.

Oesophagus (C15)

Adenocarcinoma excludes Linitis plastica (8142), which occurs in gastric epithelium. Squamous cell carcinomas includes basaloid squamous cell carcinoma (8083). The principal cancers in the Other specified carcinoma group are Small cell carcinomas (8041-8045). Melanoma and Carcinosarcoma are included among Other specified malignant neoplasms.

1	Carcinoma	8010-8576
1.1	Squamous cell carcinoma	8050-8078, 8083-8084
1.2	Adenocarcinoma	8140-8141, 8143-8145, 8190-8231, 8260-8263, 8310, 8401, 8480-8490, 8550-8551, 8570-8574, 8576
1.3	Other specified carcinoma	
1.4	Unspecified carcinoma	8010-8035
2	Sarcoma	8800-8811, 8830, 8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Anus (C21)

The category Squamous cell carcinoma includes basaloid and cloacogenic carcinomas (8123-8124) and basaloid squamous cell carcinomas (8083). Cloacogenic carcinoma is a controversial entity, sometimes defined as carcinoma arising from the anal transition zone, sometimes as a morphological variant of squamous cell carcinoma. The term basaloid carcinoma has also been used to designate this group of tumours. Their reported incidence is highly variable, possibly because of the confusing nomenclature. Hence, these tumour types are lumped together with Squamous cell carcinoma.

1	Carcinoma	8010-8576
1.1	Squamous cell carcinoma	8050-8076,8083-8084, 8123-8124
1.2	Adenocarcinoma	8140-8145,8190-8231, 8260-8263,8310,8401, 8480-8490,8550-8551, 8570-8574, 8576
1.3	Other specified carcinoma	
1.4	Unspecified carcinoma	8010-8011
2	Melanoma	8720-8790
3	Other specified malignant neoplasm	8800-8811, 8830, 8840-8920, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
4	Unspecified malignant neoplasm	8000-8005

Liver (C22)

Hepatocellular carcinoma includes hepatoid carcinoma (8576), assuming that these are miscoded Hepatocellular carcinomas. The category Cholangiocarcinoma applies to all primary carcinomas of the liver of biliary epithelial type, i.e. excluding hepatocellular carcinoma and combined hepatocellular and cholangiocarcinoma. Klatskin tumours (8162) are excluded because they are by definition extrahepatic. Combined hepatocellular and cholangiocarcinomas (8180), with less than 1% of cancers of known histology in the *Cancer Incidence in Five Continents* Vol. IX database, appear in the Other specified carcinoma category. Carcinoid is included in the same group.

1	Carcinoma	8010-8576
1.1	Hepatocellular carcinoma	8170-8176
1.2	Cholangiocarcinoma (all intrahepatic biliary carcinomas, i.e. all primary adenocarcinomas)	8050, 8140-8141, 8160-8161, 8260, 8440, 8480-8500, 8570-8572
1.3	Other specified carcinoma	
1.4	Unspecified carcinoma	8010-8035
2	Hepatoblastoma	8970
3	Sarcoma	
3.1	Haemangiosarcoma	9120-9133, 9161
3.2	Other sarcomas	8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9150, 9170, 9540-9581
4	Other specified malignant neoplasm	
5	Unspecified malignant neoplasm	8000-8005

Lung (C34)

Squamous cell carcinoma includes papillary carcinoma NOS (8050) because these are listed under Squamous cell neoplasms in ICD-O-3. Adenocarcinoma includes bronchiolo-alveolar adenocarcinoma (8250-8254) but excludes adenoid cystic (8200), mucoepidermoid (8430) and adenosquamous carcinoma (8560), which appear in Other specified carcinoma. Small cell carcinoma includes neuroendocrine carcinoma NOS (8246). These may include some large cell neuroendocrine carcinomas, but it is assumed that the vast majority of cancers that are coded 8246 are small cell carcinomas. Large cell carcinoma includes cancers so described (8012), as well as other morphological variants of undifferentiated carcinomas (except those with neuroendocrine or spindle cell differentiation) and clear cell adenocarcinoma (8310). Other specified carcinoma includes non-small cell carcinoma (8046), carcinoid tumours (8240-8245), adenoid cystic (8200), mucoepidermoid (8430), adenosquamous (8560) and large cell neuroendocrine carcinomas (8013).

1	Carcinoma	8010-8576
1.1	Squamous cell carcinoma	8050-8078, 8083-8084
1.2	Adenocarcinoma	8140, 8211, 8230-8231, 8250-8260, 8323, 8480-8490, 8550-8551, 8570-8574, 8576
1.3	Small cell carcinoma	8041-8045, 8246

1.4	Large cell carcinoma (include giant cell, clear cell and large cell undifferentiated carcinoma)	8010-8012,8014-8031, 8035, 8310
1.5	Other specified carcinoma	
2	Sarcoma	8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Bone (C40-41)
The main categories are Osteosarcoma, Chondrosarcoma and Ewing sarcoma. These three groups contain the same ICD-O entities as groups VIII A-C in the *International Classification of Childhood Cancer, Third Edition* (Steliarova-Foucher *et al.*, 2005). The Other specified sarcomas category includes epithelioid sarcoma (8804), fibrosarcoma (8810-8812), malignant fibrous histiocytoma (8830), liposarcomas (8850-8858), angiosarcomas (9120-9133) and malignant giant cell tumours (9250). The Other specified malignant neoplasm category includes desmoplastic small round cell tumour (8806), mesenchymoma (8990), chordoma (9370-9372), adamantinomas (9261, 9310) and PNET (9473).

1	Sarcoma	8800-8921, 9040-9044, 9120-9133, 9150, 9180-9250, 9260, 9540-9581
1.1	Osteosarcoma	9180-9200
1.2	Chondrosarcoma	9210-9243
1.3	Ewing sarcoma	9260
1.4	Other specified sarcomas	
1.5	Unspecified sarcoma	8800-8803, 8805
2	Other specified malignant neoplasm	
3	Unspecified malignant neoplasm	8000-8005

Skin (C43-44)
The skin has been added since the last edition of *Histological Groups for Comparative Studies*. Basal cell carcinoma is registered and reported by several cancer registries and has thus been included.

1	Carcinoma	8010-8576
1.1	Squamous cell carcinoma	8050-8078, 8083-8084
1.2	Basal cell carcinoma	8090-8098
1.3	Other specified carcinoma	
1.4	Unspecified carcinoma	8010-8035
2	Melanoma	8720-8790
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Cervix uteri (C53)
Mucoepidermoid carcinoma (8430) and adenosquamous carcinomas (8560) are included with Other specified carcinoma. The Other specified malignant neoplasm category includes mullerian mixed tumour (8950), carcinosarcoma (8980) and melanoma (8720-8790).

1	Carcinoma	8010-8380, 8382-8576
1.1	Squamous cell carcinoma	8050-8078, 8083-8084
1.2	Adenocarcinoma	8140-8141, 8190-8211, 8230-8231, 8260-8263, 8310, 8380, 8382-8384, 8440-8490, 8570-8574, 8576
1.3	Other specified carcinoma	
1.4	Unspecified carcinoma	8010-8035
2	Sarcoma	8800-8811,8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Corpus uteri (C54)
Squamous cell carcinomas are grouped with Other specified carcinoma because of their rarity at this site. Contrary to other sites, mucoepidermoid (8430) and adenosquamous carcinoma (8560) are included in Adenocarcinoma because squamous differentiation is very common in adenocarcinoma of the corpus uteri, and it is assumed that partial squamous differentiation does not change the behaviour of these neoplasms. As opposed to other sites, metaplastic carcinoma (8575) is grouped with Other specified malignant neoplasm in the corpus uteri because metaplastic carcinoma of the endometrium has been equated with carcinosarcoma. Endometrioid adenofibroma, malignant (8381) is classified as Other specified malignant neoplasm.

1	Carcinoma	8010-8574, 8576
1.1	Adenocarcinoma (include mucoepidermoid and adenosquamous carcinoma)	8140-8141, 8190-8211, 8230-8231, 8260-8263, 8310, 8380, 8382-8384, 8430, 8440-8490, 8510, 8560, 8570-8574, 8576
1.2	Other specified carcinoma	
1.3	Unspecified carcinoma	8010-8035
2	Sarcoma	8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Ovary (C56)
The first four carcinomas correspond to malignant serous, mucinous, endometrioid and clear cell tumours. Among the carcinomas not encompassed within these four groups, there are various adenocarcinomas that cannot with certainty be allocated to any of the above groups, and are hence included in Adenocarcinoma, NOS. In this category are grouped papillary adenocarcinoma (8260), cystadenocarcinoma (8440) and other variants of adenocarcinoma. Within adenocarcinoma, NOS, there are most likely a substantial number of tumours that actually belong to categories 1.1-1.4. Truly unclassified adenocarcinomas of the ovary are uncommon. Sex cord/stromal tumours have their own group. Germ cell tumours include dysgerminomas, embryonal carcinomas and teratomas, as well as the rare carcinoid tumours of the ovary, and the very rare gonadoblastomas. Lipid cell tumours, malignant Brenner tumours and sarcomas are very rare and are consigned to Other specified malignant neoplasm.

1	Carcinoma	8010-8231, 8246-8576, 9014-9015, 9110
1.1	Serous carcinoma	8441, 8460-8463, 9014
1.2	Mucinous carcinoma	8470-8490, 9015
1.3	Endometrioid carcinoma	8380-8383, 8560, 8570
1.4	Clear cell carcinoma	8310-8313, 9110
1.5	Adenocarcinoma NOS	8140-8147, 8170-8190, 8211-8231, 8260, 8384, 8440, 8576
1.6	Other specified carcinoma	
1.7	Unspecified carcinoma	8010-8035
2	Sex cord-stromal tumours	8590-8671
3	Germ cell tumours	8240-8245, 9060-9102
4	Other specified malignant neoplasm (include Mullerian mixed tumour, carcinosarcoma)	
5	Unspecified malignant neoplasm	8000-8005

Testis (C62)
The grouping of the testicular tumours has been completely revised. Spermatocytic seminoma has a more favourable prognosis than seminoma, and these tumours should not be grouped. Embryonal carcinoma, malignant teratoma, Yolk sac tumour, choriocarcinoma and mixed germ cell tumours are included in non-seminomatous germ cell tumours. Sex cord-stromal tumours are included in Other specified malignant neoplasm.

1	Germ cell tumours	9060-9102
1.1	Seminoma	9060-9062, 9064
1.2	Spermatocytic seminoma	9063
1.3	Non-seminomatous germ cell tumours	9065-9102
2	Other specified malignant neoplasm	
3	Unspecified malignant neoplasm	8000-8005

Kidney (C64) and Renal Pelvis (C65)
There are several major difficulties with the histological grouping of kidney tumours. Transitional cell and squamous carcinomas in the kidney usually originate from the renal pelvis, although it may be difficult to trace the origin of the tumour. It can be assumed that some of these are site coded kidney (C64) and others renal pelvis (C65). Hence, these two sites are now grouped.
Renal cell carcinomas have recently undergone a reclassification based on molecular, cytogenetic, morphological and clinical data. However, a substantial portion of these tumours are coded as renal cell carcinoma, NOS (8312) or adenocarcinoma, NOS (8140), while others are subtyped. Therefore, the renal cell carcinomas are grouped together with adenocarcinoma, NOS (8140), specific subtypes of renal cell carcinoma and also obsolete entities such as granular cell carcinoma (8320). Papillary carcinoma, NOS (8050) is listed under squamous cell neoplasm in ICD-O-3. When used for renal tumours most of these are probably miscoded papillary renal carcinomas, and are therefore included in 1.2.

1	Carcinoma	8010-8576
1.1	Squamous, transitional cell carcinoma	8051-8084, 8120-8122, 8130-8131
1.2	Renal cell carcinoma	8050, 8140, 8260, 8270, 8280-8312, 8316-8320, 8340-8344
1.3	Other specified carcinoma	
1.4	Unspecified carcinoma	8010-8035
2	Other specified malignant neoplasm	
3	Unspecified malignant neoplasm	8000-8005

Urinary bladder (C67)
The classification of urinary bladder tumours has undergone several revisions in recent years. Some low-grade papillary transitional cell tumours are now designated as papillary urothelial neoplasia of low malignant potential, PUNLMP (8130/1). In order to enable longitudinal comparisons, flat carcinoma *in situ* (8120/2) and PUNLMP (8130/1, 8130/2) have been grouped with Transitional cell carcinoma.

Papillary carcinomas (NOS 8050) are listed under squamous cell neoplasm in ICD-O-3. When used for bladder tumours, most of these are probably miscoded transitional cell carcinomas, and are therefore included in the Transitional cell carcinoma group. Pheochromocytoma, malignant paraganglioma, melanoma and carcinosarcoma are included in Other specified malignant neoplasm.

1	Carcinoma	8010-8576
1.1	Squamous cell carcinoma	8051-8078, 8083-8084
1.2	Transitional cell carcinoma (include transitional cell carcinoma with squamous and/or glandular differentiation)	8050, 8120-8122, 8130-8131
1.3	Adenocarcinoma	8140-8145, 8190-8231, 8260-8263, 8310, 8401, 8480-8490, 8550-8551, 8570-8574, 8576
1.4	Other specified carcinoma	
1.5	Unspecified carcinoma	8010-8035
2	Sarcoma	8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Eye (C69)
The principal eye cancers—retinoblastoma and malignant melanoma—form two groups. The carcinomas (11.4% of eye cancers in the IARC database) are divided into three subgroups: Squamous cell carcinomas (70% of the carcinomas, principally tumours of the conjunctiva and cornea), Other specified carcinomas (comprising almost entirely adenocarcinomas, 14.6%, and mainly originating in the lacrimal gland and duct), and Unspecified carcinoma. Squamous cell carcinomas that are site coded for the eye (C69) probably include some cancers that originate in the skin (C44) of the eyelids.

1	Retinoblastoma	9510-9513
2	Malignant melanoma	8720-8790
3	Carcinoma	8010-8576
3.1	Squamous cell carcinoma	8050-8078, 8083-8084
3.2	Other specified carcinoma	
3.3	Unspecified carcinoma	8010-8035
4	Sarcoma	8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581

5	Other specified malignant neoplasm	
6	Unspecified malignant neoplasm	8000-8005

Brain and central nervous system (C71-C72)

The categories are based upon those of the WHO Pathology & Genetics classification (Kleihues & Webster, 1997). Atypical teratoid/rhabdoid tumour (9508) is included in Embryonal tumours. Olfactory, pineal and some pituitary tumours are lumped together under Other neuroepihelial tumours. These are craniopharyngioma (9350-9352), pinealoma, pineocytoma, pineoblastoma (9360-9362) and olfactory neuroepitheliomatous neoplasms (9520-9523). Pinealoma (9360) encompasses pineocytoma (9361) and pineoblastoma (9362). The lymphomas and haemopoietic neoplasms are not included.

1	Tumours of neuroepithelial tissue	8680, 9350-9362, 9380-9508, 9520-9523
1.1	Gliomas	9380-9384, 9391-9460
1.1.1	Astrocytic tumours	9384, 9400-9421, 9424, 9440-9442
1.1.2	Oligodendroglial tumours and mixed gliomas	9382, 9450-9451
1.1.3	Ependymal tumours	9383, 9391-9394
1.1.4	Gliomas, others	9380-9381, 9423, 9430, 9444, 9460
1.2	Embryonal tumours	9470-9474, 9490, 9500-9504, 9508
1.2.1	Medulloblastoma	9470-9472, 9474
1.2.2	Other	9473, 9490, 9500-9504, 9508
1.3	Other neuroepithelial tumours	
2	Other specified malignant neoplasm	
3	Unspecified malignant neoplasm	8000-8005

Thyroid (C73)

Follicular and Papillary carcinomas make up the majority of thyroid cancers; the latter includes follicular carcinomas with a papillary component (8340). It is assumed that the vast majority of cases of Papillary squamous carcinoma (8050) are actually papillary carcinomas, and they are therefore included in this category. Minimally invasive follicular carcinoma (8335) is a new code in ICD-O-3 and is included among Follicular carcinomas.

Squamous carcinomas are no longer recognised as a major histological type in the *WHO Classification of Tumours* and are included in Other specified carcinomas.

Anaplastic carcinomas (undifferentiated, giant cell, spindle cell carcinomas) are separated from Unspecified carcinomas. The entity Poorly differentiated carcinoma is controversial and has been lumped with Anaplastic carcinoma. Small cell carcinoma (8040-8045) is specifically excluded, since the great majority of tumours previously so diagnosed are in fact lymphomas.

Insular thyroid carcinoma (8337) is a distinctive clinicopathologic entity that has been included in Other specified carcinoma. Mixed medullary-follicular carcinoma (8346) and mixed medullary-papillary carcinoma (8347) are also included in Other specified carcinoma.

1	Carcinoma	8010-8576
1.1	Follicular carcinoma	8290, 8330-8335
1.2	Papillary carcinoma	8050, 8260, 8340-8344, 8350, 8450-8460
1.3	Medullary carcinoma	8345, 8510-8513
1.4	Anaplastic carcinoma	8020-8035
1.5	Other specified carcinoma	
1.6	Unspecified carcinoma	8010-8015
2	Sarcoma	8800-8811, 8830, 8840-8921, 8990-8991, 9040-9044, 9120-9133, 9150, 9540-9581
3	Other specified malignant neoplasm	
4	Unspecified malignant neoplasm	8000-8005

Haematopoietic and lymphoid tissues (9590-9989)

In the previous edition of *Histological Groups for Comparative Studies*, haematologic tumours were listed separately as Hodgkin disease and Leukaemias, but are now included in the same grouping based on cellular origin. Hodgkin lymphoma has been reclassified and lymphocytic predominance (9657-9659, 9660) is replaced by the new categories nodular lymphocytic predominance (9659) and classical lymphocyte-rich (9651). The category Non-Hodgkin lymphoma NOS is used because some cancer registries lack sufficiently specific data for lineage-based classification.

1	Hodgkin lymphoma	9650-9667
1.1	Nodular lymphocytic predominance	9659
1.2	Classical lymphocyte-rich	9651
1.3	Nodular sclerosis	9663-9667
1.4	Mixed cellularity	9652
1.5	Lymphocytic depletion	9653-9655
1.6	Unspecified	
2	B-cell neoplasms	9670-9699, 9728, 9731-9734, 9761-9764, 9823-9826, 9833, 9836, 9940
3	T-cell and NK-cell neoplasms	9700-9719, 9729, 9827-9831, 9834, 9837, 9948
4	Myeloid neoplasms	9840, 9860-9931, 9945-9946, 9950, 9960-9964, 9975, 9980-9989
5	Non-Hodgkin lymphoma NOS	9591
6	Other specified malignant neoplasms	
7	Unspecified malignant neoplasms	9590, 9596, 9727, 9760, 9800-9801, 9805, 9820, 9832, 9835

Chapter 5: Comparability and quality of data

H.R. Shin, M.P. Curado, J. Ferlay, M. Heanue, B. Edwards and H. Storm

The purpose of Cancer Incidence in Five Continents is to present comparable incidence rates of cancer from different populations world-wide. The process of selecting the data to be included and the review and evaluation of the datasets by the Editors therefore require careful attention to several aspects related to comparability. As far as the cases registered (numerators of the rates) are concerned, these include:

(*a*) The definition of an incident case of cancer,

(*b*) The completeness of enumeration of cases in the population covered, and

(*c*) The accuracy of abstraction and coding of information.

In addition to these, the denominator—person-years at risk for the period under consideration—should be estimated as accurately as possible.

In this chapter we explain the evaluation of data comparability and quality undertaken by the Editors for this volume, and introduce the traditional tables of Indices of Data Quality with which the users themselves can make judgements on the completeness and validity of the different datasets.

Details of the standard definitions used by cancer registries to define an incident cancer, and the indices of comparability or validity that are found in the publication *Comparability and Quality Control in Cancer Registration* (Parkin 1994) and Chapter 5, "Comparability and quality of data" in the previous volumes (Parkin and Plummer 2002, in Volume VIII), were adopted to evaluate submissions for this volume.

In contrast to Volume VIII of *Cancer Incidence in Five Continents*, a comparison with standard values for several quantitative indices in the same region (see Chapter 5 in Volume VIII, pp. 66–67) was not executed for this volume. However, the editors tried to achieve standardization for this volume with more thorough efforts.

For Volume IX, the Editors considered these items:

(a) The number of cases in each year within the reference years 1998–2002, for the abrupt changes of number of cases by year in terms of completeness;

(b) The rates for each year, to check the tendency and stability of cancer incidence rates within the reference year;

(c) Other indices of data quality traditionally used by cancer registries, which are described later in detail;

(d) The existence and usage of official mortality data; and

(e) The coverage of the defined population.

The following Chapter 6, on Processing of Data, makes it clear that an extensive process of verifying coding, identifying possible duplicate registrations, querying unlikely or impossible combinations of codes, and converting data to a standard format has been carried out before any tabulations are prepared for editorial evaluation. These steps in validation of the data are part of the routine to which all datasets are subjected, and the successful completion of these steps forms part of the editorial evaluation.

A systematic and standard analysis according to the internal protocol at IARC produced the editorial tables and figures (listed below) that were provided to each contributor to allow an opportunity for feedback. These editorial sheets, along with the responses to the questionnaire filled by the registry and data process summary sheet were transferred to the secure FTP site. The site was subdivided into directories for each continent, country and registry. The external Editors, each assigned a continent, downloaded them for an initial review of the editorial sheets, and filled in a review summary form that was uploaded to the FTP site before the editorial meetings.

The systematic analysis produced the following:

(a) A set of editorial tables and figures including Editorial Sheets 1a (number of cancer cases) and 1b (age-standardized rates in major diagnosis groups in single calendar years of observation by sex)(Tables 5.1, 5.2), and Editorial Sheets 2a and 2b, age-specific graphs for major diagnosis groups, linear and logarithmic (Figures 5.1 and 5.2 respectively);

(b) The tables of age- and site-specific rates and summary rates (crude, age-standardized, percentage of Microscopically Verified cases (MV), and the change from the rates reported in Volume VIII (CH V8) (when available: see subsection *Comparison of rates with those in Volume VIII* in the section *Stability of incidence over time*) (Table 5.3);

(c) Other indices of data quality traditionally used for cancer registration, which are described later in detail (Table 5.4);

(d) The estimated population at risk, with the source of information as a form of population pyramid by sex and age, and the method of estimation used (population pyramids: Figure 5.3);

(e) The questionnaire responses provided by the registry; and

(f) Summary sheet to check the coding system, with applied rules for multiple primaries in the questionnaire (Figure 5.4).

At their formal meetings, the editors had access to all of the above, and each external editor reported the review result. All Editors agreed upon the final decision, and the responsible Editor filled in an evaluation form with the final decision and some queries, if necessary.

Comparability

Definition of incidence

In defining incidence rates, particular attention is required in three broad areas:

(*a*) The distinction between recurrence or extension of an existing cancer and the development of a new primary;

(*b*) The detection of cancers incidentally, in asymptomatic individuals; and

(*c*) The detection of cancers at autopsy.

Multiple primaries

Contributing registries were invited to submit all malignant and non-malignant diagnoses collected so that a common set of multiple primaries rules could be applied to each dataset. In this volume, the data were recoded (when necessary) into ICD–O–3 (Fritz *et al.*, 2000), and the international rules used to distinguish new primary cancers from existing extensions/recurrences were those set out in the IARC/IACR definitions (IARC, 2004). This also requires that all cancers in the same individual could be identified. Of the registries included in this volume, 46 did not provide a patient identification number, making it impossible for the Editors to distinguish multiple primary tumours from duplicate registrations. For those registries, the rules used prior to submission are indicated below the population pyramid of the corresponding registry.

As a result of recoding the datasets to the international standard, for those contributors who sent data already recoded according to a different set of rules, the results published in the volume do not exactly correspond to those published by the registries themselves. Table 5.5 shows the registration practices for the multiple primary rules by continent.

The second multiple primary check procedure performed at IARC may have removed some cases considered as duplicate registrations and, conversely, some records that are considered multiple primaries following the IARC/IACR rules (2004) may have been considered duplicates following the registry rules and excluded from the submission. For example, the Korea Central Cancer Registry submitted data for the period 1999–2002 according to the IARC/IACR rules (IARC, 2000). According to these rules, at least 261 cancer cases (of a total of approximately 430 000) that should have been considered multiple primaries following the IARC/IACR rules (2004) were considered duplicates by the registry and were not sent to IARC. In addition, 433 records that were considered multiple primaries by the registry were considered duplicates following the IARC/IACR (2004) rules and excluded from the final tables.

The number of cases to be removed due to duplicate cases on the basis of the 2004 rule is in fact very small, mostly affecting the number of cases from groups of tumours of the bladder, kidney and renal pelvis. Groups of haematopoietic and lymphoid tissues were changed to a more detailed classification. To compare the effect on incidence rates and time trends of certain sites, therefore, we should pay special attention to the changes in application of the multiple primary rules.

Incidental diagnosis

Almost all registries include malignant tumours diagnosed during screening programmes, or histological specimens taken from individuals in whom there were no symptoms, or no clinical suspicion of cancer. These cases will increase incidence rates if the malignant cells so identified would never have resulted in a clinical cancer had they remained undetected. The incidence of breast cancer appears to have been increased by the introduction of systematic mammographic screening for cancer. More striking, however, are the effects of such incidental diagnoses on the reported incidence of prostate cancer following the introduction of screening with prostate-specific antigen. Similarly, the increase in diagnostic activity may have influenced the incidence of thyroid cancer. Table 5.6 and 5.7 show the registration practices for using a screening program as a data source by continents.

Autopsy diagnosis

Most registries include cancers identified in necropsy examinations of subjects in whom cancer was not diagnosed (or perhaps even suspected) during life. The possible influence on incidence rates will depend upon the extent of necropsy examinations in different populations; in general this has been declining in most countries in recent decades. The registries' own appraisal of the percentage of cancer deaths autopsied is reproduced in Table 5.7.

Coding practice

For five cancer sites—skin, non-melanoma (ICD–10 C44), ovary (ICD–10 C56), urinary bladder (ICD–10 C67), brain and central nervous system (ICD–10 C70–72), and myeloproliferative disorders and myelodysplastic syndromes (MPD/MDS)—comparability is particularly affected by differences in classification and coding practices. These sites are printed in italics in the cancer registry tables, and care should be taken when comparing data from different registries for these sites.

Non-melanoma skin cancer. The incidence of non-melanoma skin cancer (NMSC) is difficult to assess. These cancers are very common but rarely fatal, and completeness of registration varies widely depending on access to outpatient records and general practitioners. Most NMSCs are basal cell (BCC) or squamous cell (SCC) carcinomas; other skin cancers are rare. While some registries record the first occurrence of all NMSC, others register BCC only, several registries collect information for lip and/or genital sites only, and many do not collect data on either SCC or BCC.

Ovarian cancer. Registries contributing to this volume were asked how they coded ovarian cystadenoma of borderline malignancy and borderline tumour of the ovary (see Chapter 3). Clearly, for these diagnoses, registration practice varies considerably. The borderline ovarian diagnoses were considered as non-malignant tumours in ICD–O–1/ICD–9. They were considered malignant in ICD–O–2/ICD–10, and have been changed back to the /1 borderline category in ICD–O–3; as a result, they have been excluded from the final tables in the present volume. Studies of trends in incidence should take into account the practice in previous volumes.

Bladder cancer. The problem of the coding of non-invasive tumours, taking into account recorded level of invasion and grade, and which to include in the tables as 'cancer of the bladder' has long been the subject of debate. In principle, the availability of data on histological type and behaviour has made it possible to publish only data on malignant cancer by excluding diagnoses with any behaviour code other than /3. However, many registries assign the behaviour code /3 to both non-invasive and unspecified diagnoses, making it impossible to distinguish such cases. The Editors decided to follow the policy adopted in the last two volumes and to accept that non-invasive diagnoses of bladder cancer (/1 and /2) are considered malignant, and the bladder cancer category includes the *in situ* and unspecified categories. A few registries preferred not to include such cases in their dataset, even when available in the registry, for the sake of continuity over time.

Brain and central nervous system. Benign and unspecified tumours of the brain and central nervous system are excluded from the tabulation. Some registries choose to include benign and unspecified tumours of the brain and central nervous system in their data because of the potentially serious clinical consequences of these tumours, and assign the behaviour code /3 to both benign and unspecified diagnoses, so making it impossible to distinguish such cases.

Myeloproliferative disorders and myelodysplastic syndromes. Unlike ovarian borderline tumours, these diagnoses that were considered as non-malignant disease (/1) in ICD–O–2 and in ICD–10 (D45–D47) have changed behaviour code to malignant (/3) in ICD–O–3. Only registries that collect information according to ICD–O–3, or those registries which have collected and submitted such cases although they were considered as non-malignant, can present data. Because no ICD–10 codes in the 'C' (malignant) category have been allocated to them, they are presented under the category MPD/MDS.

Completeness

Completeness of registration is the proportion of all incident cases in the registry population that have been included in the registry database. Completeness should be as close to 100% as possible, so that comparison of incidence rates between registries reflects true differences in cancer risk.

The Editors' main concern is with the possibility of incompleteness in the data submitted. *Duplicate registration* of the same case should be avoided by careful attention to record linkage during the registration process. Because the case lists submitted do not contain personal identifying information, it is impossible for the Editors to check for possible duplicates. However, sometimes the existence of duplicate registration was suspected, e.g. by indices of completeness (see below) being

higher than expected, and listings of possible duplicates (based on birthdate, sex, diagnosis and date of incidence) were returned to the registry for checking.

The following indices of completeness are routinely used during the editorial process:

(1) Historic data methods:
  (*a*) Stability of incidence rates over time
  (*b*) Age-specific incidence curves
  (*c*) Childhood cancer
(2) Proportion of cases microscopically verified
(3) Proportion of unknown basis of diagnosis
(4) Mortality:incidence (M:I) ratio
(5) Death certificate methods

Stability of incidence over time
Constancy of registrations during the period under review
Editorial Tables 1a and 1b (Tables 5.1 and 5.2) simply present the distribution of cases registered and age-standardized rates, by site and year. Those permit a rapid visual check on the stability of numbers of cases being recorded each year and signal potential problems in the registration process and/or in the population during the period under review.

Comparison of rates with those in Volume VIII
The change in incidence rates (as average percentage annual change) since Volume VIII is presented in the column headed CH V8 in Editorial Table 3 (Table 5.3). Those changes that are statistically significant, based on a comparison of the age-standardized rate in Volume VIII, are marked in bold. Changes in incidence rates over time that are greater than expected, and which cannot be ascribed to discrepancies in the estimation of person-years at risk, suggest the possibility of changes in the completeness of case ascertainment. When there was no corresponding rate published for that site in Volume VIII, the current rate was compared with an average value from other regions in the same country, or from neighbouring countries.

Age-specific incidence curves
Age-specific incidence curves for 12 sites in each sex comprised Editorial Sheet 2a, 2b (Figures 5.1 linear, 5.2 logarithmic). The curves were examined during the editorial process in order to detect abnormal fluctuations in the anticipated patterns, including any fall-off in the rate of increase in incidence in older subjects (suggestive of under-ascertainment in the oldest age groups). The curves also reveal problems with estimates of population at risk for specific age groups.

Childhood cancer
The possibility of under-enumeration (or duplicate registrations) in this age range was investigated by comparing the observed age-specific rates in the childhood age range (groups: 0–4, 5–9, 10–14 for all cancer sites) with the corresponding rates in Volume VIII, when available.

Proportion of cases microscopically verified
Editorial Sheet 4 (Table 5.4) tabulates, for each site by sex (19 for men, 21 for women), the percentage of cases for which the diagnosis was based upon microscopic verification of a tissue specimen (MV%). This includes, in addition to histological confirmation of diagnosis, those based upon exfoliative cytology specimens, and diagnoses of leukaemia based on haematological examination (without examination of bone marrow). The MV% figures are also presented in the tables of Indices of Data Quality on the website.

The main value of the MV% is as an indicator of the validity of the diagnostic information (Parkin et al., 1994). However, a very high proportion of cases diagnosed by histology or cytology/haematology—higher than might reasonably be expected—suggests over-reliance on the pathology laboratory as a source of information, and failure to find cases diagnosed by other means.

In Editorial Sheet 4 (Table 5.4), the column 'MV%' values in bold, accompanied by a flag (</>) signifies that the number of cases so diagnosed is significantly greater than (>) or less than (<) the value observed by sex and site in Volume VIII when available. When there was no MV% published for that site in Volume VIII, the current MV% was compared with an average MV% value from the other regions in the same country, or from neighbouring countries.

Proportion of cases of unknown basis of diagnosis
When each new cancer case is registered, the diagnostic modality is described as being by histology, cytology/haematology, clinical investigation with X-ray, ultrasound, MRI, autopsy or clinical diagnosis only. Cases not distinguished by the above modalities are listed as "unknown basis of diagnosis". If the proportion of cases denoted as "unknown basis of diagnosis" is higher than 20%, completeness of the registry is not sufficient to be included in this volume.

Mortality:Incidence ratio
This ratio is an important indicator of completeness, an example of the independent case ascertainment method (Parkin et al., 1994). Registries are asked to provide the mortality data on cancer by sex, age group and site, for the same period as the registered cases, from the local vital statistics office (municipal, provincial, national, etc.). Registry-generated mortality statistics (based on cases in the registry database who die during the period, or incorporating corrections to the certified cause of death) are *not* acceptable, since they do not constitute an independent data source.

When the quality of the mortality data is good, the M:I ratio is related to case fatality (1-survival). However, when mortality statistics are of poorer quality (incomplete certification, inaccurate cause of death statements) the relationship will be less close. Evaluation of the M:I ratio should take this into account. Since both survival and quality of mortality statistics are somewhat related to geographical region the regional location of the registry is important in evaluation of the statistic. As it is typical to use M:I ratio as a criteria for inclusion or exclusion, in the process of evaluation the editors compared the M/I ratio by site with a reasonable threshold level.

In Editorial Sheet 4 (Table 5.4), the M:I ratios for a given site are marked as being significantly greater (>) or less (<) than observed on the *Cancer Incidence in Five Continents*, Volume VIII, when available. When there was no corresponding ratio published for that site in Volume VIII, the current ratio was compared with an average value from the other regions in the same country, or from neighbouring countries. The tables of Indices of Data Quality show the values of the M:I ratio for registries where official mortality statistics are available.

Death certificate methods
Death certificates provide an important supplementary source of information for cancer registries. As far as incidence statistics are concerned, they function as a means of capturing information on cases that escaped the registration process during life.

Completeness of registration may be evaluated on the basis of the proportion of incident cancers that first come to the registry's attention via a death certificate notification of cancer (DCN cases). This proportion was provided by the registry to the editors of *Cancer Incidence in Five Continents,* whose data include only the numbers of death certificate only (DCO cases)—that is, the residuum of cases remaining after various follow-back procedures have been carried out on DCN cases. By itself, therefore, the DCO% is not an indicator

of completeness of registration; a low DCO% may indicate efficient case-finding, but it could equally well result from the efficient traceback of DCN cases (for example, there are actually no DCO cases with complete traceback in the Australia South and Canada Northwest Territories datasets). Nevertheless, the DCN% will always be equal to or greater than the DCO%, so an elevated DCO% is suggestive of incompleteness. Even this must be interpreted in the light of local circumstances; in some developing countries, the quality of death certificates may be very poor, with a fair number of erroneous cancer deaths, which the registry may have difficulty tracing back to a hospital capable of confirming (or not) the death certificate statement. Table 5.8 shows the registration practice used to distinguish the DCN cases and DCN (%) by each registry.

Failure to use death certificates, when these are available and can be linked to the registry database, is generally taken to mean that some lack of completeness is likely to be present.

Validity

Validity is defined as the proportion of cases in a data-set with a given characteristic (e.g., site, age) that truly have the attribute. *Cancer Incidence in Five Continents* uses five of the common indices of validity (Parkin *et al*., 1994):

(*a*) Internal consistency
(*b*) Histological verification
(*c*) Death certificate only
(*d*) Other and unspecified cases (ill-defined cases)
(*e*) Age unknown

The use of the IARC-CHECK program to perform consistency checks on the submitted data-sets is described in the chapter on data processing (Chapter 6). In practice, all datasets were submitted to this process, and the cases queried checked by the registry before incorporation into the database.

Microscopical verification

For most cases, the accuracy of the stated diagnosis is likely to be higher if it is based on histological examination by a pathologist. Previous surveys have shown that many cancer registries code diagnoses based on exfoliative cytology or on haematological examination of peripheral blood in the same category as histological examinations, so that it is impossible to distinguish between them. Partly for this reason, the index of validity used in the Editorial Sheet (Table 5.4) and the tables of Indices of Data Quality in this volume concern the percentage of cases microscopically verified.

For example, the MV% of liver cancer gradually decreased in the data from some Asian registries. In the practice guidelines, the diagnostic criteria of hepatocellular carcinoma included the non-invasive methods defined by the European Association for the Study of the Liver (Bruix *et al*., 2001) and by the American Association for the Study of Liver Disease (Bruix & Sherman 2005). In the regions with a high proportion of liver cancer among the total number of incidence cases, the overall MV% will be highly affected by the MV% of liver cancer. The practice guidelines should be considered in the evaluation of cancer cases from registries. Therefore, MV% without liver cancer was considered as one of the criteria for acceptance.

Also, MV% without leukaemia was considered when the MV% of each registry was less than the threshold of inclusion criteria.

Death certificate only

In this volume, considerable effort has been made to ensure that what is reported as DCO cases in the Editorial Tables and Indices of Data Quality Tables does, indeed, refer to such cases. That is, they represent the residuum of cases—*after all trace-back manoeuvres have been completed*—for which no other information than a death certificate mentioning cancer could be obtained. Inasmuch as the diagnostic information on death certificates is well known to suffer from lack of accuracy, or lack of precision, a high proportion of DCO cases implies a lack of validity of the data. It would usually imply a lack of completeness also, as noted earlier (see section on *Death certificate methods*).

There are many considerations involved in interpretation, and the sensitivity of the DCO% to local circumstances (availability of death certificates, quality of cause-of-death statements, facility to trace back cases). In this volume, the datasets with less than 20% of DCO cases were considered for the evaluation.

Other and unspecified (ill-defined) cases

The content of this category is defined in Chapter 3 (see Table 3.1). A high proportion of cases assigned to these rubrics generally implies poor diagnostic precision (as evidenced by the low MV% observed for this rubric), or failure to specify the site of the primary cancer in cases diagnosed on the basis of tissue obtained from a metastasis.

The percentage of ill-defined cases is given in Editorial Sheet 4 (Table 5.4). In this volume, only data with less than 20% of ill-defined cases were considered for the evaluation.

Age unknown

The proportion of cases for which age was unknown is reported in Table 5.3. In this volume, only data with less than 20% of age-unknown cases were taken into account for the evaluation.

Population

It is obvious that a 10% error in the estimation of population at risk produces just as much inaccuracy in the calculated incidence rate as a 10% error in enumeration of cases. However, cancer registries are generally not responsible for population estimates, and must rely upon various departments of central and local government to supply the required information. Registries should, however, inform themselves about the source of the population-at-risk figures that they use, and the methods used to produce estimates and projections. The Editors of this volume asked all contributing registries to provide this information, and it is summarised, along with the average annual population at risk for the period covered by the registrations, for each entry.

The population data provided by a registry could rarely be subjected to verification by the Editors. The shape of the population pyramids and irregularities in the age-specific incidence curves sometimes suggested errors in the estimates, and occasionally the appropriateness of the source of the information provided was queried. For Volume IX, which mainly concerns periods of time around 2000, census data were usually available, so that part of population at risk was based on post-censal and the other on intercensal estimates.

Grouping of datasets according to the inclusion criteria

Inclusion criteria

The Editors applied standard definitions for the inclusion criteria using the indices described above.

Up until Volume VIII, there were no rigidly defined criteria with ranges of acceptability for some quality indices; however, the Editors considered the guidelines for scrutinising the data when comparing them to previous volumes. The comparability groups A, B and C were created to facilitate high throughput of evaluation, did not require strict criteria for inclusion, and aided the Editors in the evaluation process. Table 5.7 shows the summarised inclusion criteria used for the review and evaluation of submissions and resubmissions. For some datasets, the intrinsic interest in providing information on little-known geographical and ethnic patterns, or continuity with earlier data from the same registry, were taken into consideration. The specialised cancer registries—e.g. site-specific cancer registries and childhood cancer registries—were not considered for inclusion.

Categorisation (Grouping)
Submissions with more than three-year data were taken into account for evaluation. Data with less than 20% of DCO cases, ill-defined cases, age-unknown cases were considered, except for some registries of special interest due to their geographical location.

An overall MV% of more than 75% was considered acceptable (data with higher than 99% of MV% were not considered for evaluation; see section on *Proportion of cases microscopically verified*). However, some registries reported a MV% without liver cancer or ill-defined cases that was higher than 75% (higher than 70% for some special-interest registries, for example China Jiashan) and were included as described in subsection *Microscopical verification* in the *Validity* section. Even though there was no strictly applied threshold of Mortality:Incidence ratio, a practically reasonable value by site was considered. Those with implausibly low or high incidence rates were not included in this volume.

The Editors received 313 submissions from cancer registries. For the editorial process, the submissions were categorized into three groups (group A, B, and C) according to the quality indicators. Of these, 225 (71.8% of submissions) were included.

Group A
The registries that included death reporting in the registry region that was in compliance with WHO recommendations were grouped as Group A. Data in this group also had more than 80% MV% and less than 10% ill-defined site, DCO% and unknown basis of diagnosis. Ideally, the registries with almost 100% completeness were considered for this group. The registries should have well-defined denominators and not show abrupt changes in trends. (For an example of Group A, see Editorial Sheet 4; Table 5.4a).

Group B
If a cancer registry had no access to death certificate data, even the existence of official mortality with causes of death, it was classified as comparability Group B. The registries were those with MV% between 75% and 80%. As described above, registries with a MV% due to a high proportion of liver cancer were calculated without liver cancer. MV% without leukaemia was also considered for this group. (For an example of Group B, see Editorial Sheet 4; Table 5.4b).

Group C
Regions or countries without official mortality were grouped as "C" for comparability. In terms of completeness, the registries in which ad hoc study is not available and death clearance is not a source of case finding were grouped into Group C. (For examples 1 and 2 of Group C, see Editorial Sheet 4; Table 5.4c).

The asterisk (*) for Group C and datasets of special interest
The presence of an asterisk on a registry table denotes that care should be taken in interpreting the rates for some or all of the cancer sites listed. The principal reason for use of an asterisk is to indicate those datasets, a total of 26, that the Editors considered to have some limitations in determining the number of cases or the population at risk that could affect the ability to make direct comparisons with other registry datasets. The criteria used to assign an asterisk were not strictly defined, being based instead on a number of quantitative indices discussed in this chapter as well as knowledge of the circumstances under which the registry operates. Certain registries were considered to be of special interest due to their providing important data on geographic or population groups little represented in the literature, and this was taken into consideration as well.

The submitting registries were notified of the assigned comparability group, but this information does not appear in the published volume.

Table 5.8 Summary of applied inclusion criteria for comparability and quality of data in Volume IX

Group A	**Group B**	**Group C**	**Excluded**
Complete coverage	No access to death certificates	No *ad hoc* study of completeness	Data with ≤2 years
Death reporting meets WHO recommendations	Official mortality data not available by cause, or poor quality by cause	No death clearance as source of case finding	DCO >20% %Unk >20% ill-defined site >20%; overall MV% <75%
%Unk <10% DCO <10% Ill-defined site <10% MV% >80% DCO 0.0% (no DCOs)*	10% < %Unk <20% 10% < DCO <20% 10% < ill defined <20% 10% < age unk <20% 75% < MV% <80%	No official mortality data	MV% too high (99–100%) MV% low for selected sites; M/I threshold by site
No abrupt trends, cases; Denominators OK	*MV% but C22*** *MV% but C91-95****		Implausible incidence rates; Specialized registries, e.g. childhood, mesothelioma

*No DCO cases due to complete trace back for the DCN cases; **C22: liver cancer; ***C91-95: leukaemia.

Chapter 6: Processing of data

J. Ferlay

There were 313 cancer registries that replied to the invitation to participate by submitting data for Volume IX of *Cancer Incidence in Five Continents* (CI5). Each cancer registry sent its own data, except the registry members of the Surveillance Epidemiology and End Results (SEER) and of the National Program of Cancer Registries (NPCR) of the United States, and six Canadian registries that provided their data in a single data submission.

The data were generally sent to the IARC secretariat through electronic mail or on CD-ROM for large files, and as usual, were accepted in any electronic format (text files, Excel™ spreadsheet, database files, etc.) and with any file layout. Contributing registries were also invited to send all their data containing all malignant and non-malignant diagnoses collected. In addition, official cancer mortality data for the reference period, and population data, ideally for each calendar year of the reference period, should also be provided and checked by the IARC secretariat. This resulted in the manipulation of more than thirty million individual records, and in the production of 389 preliminary datasets (including different ethnic groups) to be examined carefully by the editors. A procedure for data validation and storage, summarised in Figure 6.1, was established to handle the large amount of data submitted for the project.

Incidence data

The incidence data were submitted as listings of individual anonymous cases with at least the following variables:

1. A registration number that identifies the patient or the case
2. Sex
3. Ethnic group or race (optional)
4. Age and/or birth date
5. Date of incidence
6. Site of the tumour (topography)
7. Morphology of the tumour
8. Behaviour of the tumour
9. Most valid basis of diagnosis

A description of all the codes used for the variables had to be provided with the data. However, it was not unusual for the code values to not match the description provided or for the coding information to be missing. In that case, the registry was asked for clarification and to provide the correct codes if necessary. This is particularly important when computing the percentage of microscopically verified (MV) or death certificate only (DCO) cases used for the editorial process: a misinterpretation of the basis of diagnosis code could lead to a false picture of the data quality.

Conversion into ICD-O-3

The first stage of the editorial process is to examine the incidence data using the standard IARC-CHECK program. This requires the data to be coded into a full (Topography and Morphology) ICD-O-3 coding schema. A large majority (230) of the registries submitted data according to this classification, but the others (72) had to be converted before they could be handled by the program. Several datasets included both ICD-O-1 and ICD-O-2, not to mention ICD-9 and ICD-10 codes (for coding of the DCO cases) depending on the year of incidence of the case, so that they had to be split into two or more files, each piece of the puzzle being converted using the appropriate program (Figure 6.2). These preliminary conversions proved to be particularly valuable in detecting incompatibilities between ICD-9 or ICD-10 codes and ICD-O morphology and behaviour (Table 6.1), which were transmitted back to the cancer registry for review and correction.

Figure 6.1. Processing of cancer registry data to generate *Cancer Incidence in Five Continents Volume IX*

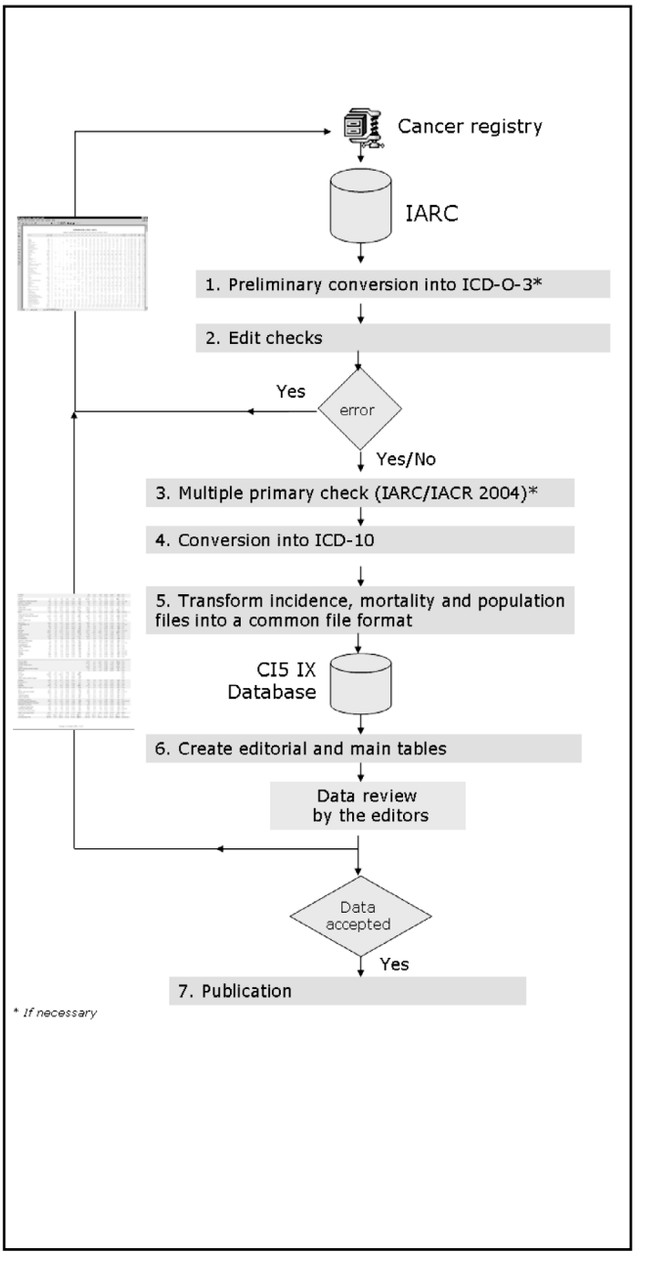

Table 6.1 Examples of unlikely ICD-10 site/ICD-O-2 morphology combinations

ICD-10		ICD-O second edition (correct code if incorrect)
C22.0	Hepatocellular carcinoma	8010/3 Carcinoma, NOS (8170/3)
C45.0	Mesothelioma of pleura	8050/3 Papillary carcinoma, NOS (9050/3)
C46.0	Kaposi sarcoma of skin	8140/3 Adenocarcinoma, NOS (9140/3)
C91.0	Acute Lymphoid Leukaemia	9823/3 Chronic Lymphocytic Leukaemia (9821/3)
C81.9	Hodgkin disease, NOS	9670/3 Malignant lymphoma, small lymphocytic (9650/3)
C43.9	Melanoma of skin, NOS	8090/3 Basal cell carcinoma (8720/3)
C34.9	Lung (primary cancer)	8140/6 Adenocarcinoma, metastatic (8140/3)
C53.9	Uterine cervix, malignant	8070/2 Squamous cell carcinoma in situ (8070/3)

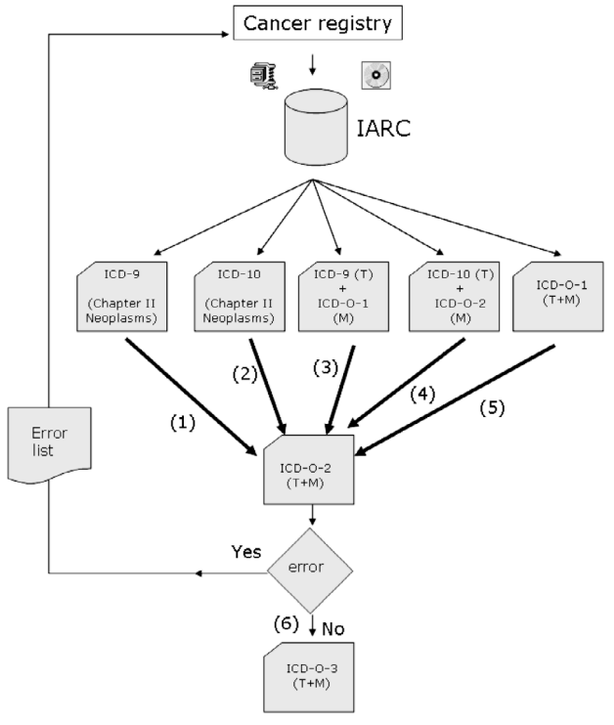

Figure 6.2 Preliminary conversions of cancer registry data
(1) ICD-9 (1975), chapter II neoplasms, to the second edition of ICD-O (1990) conversion program.

(5) First edition of ICD-O (1976) to the second edition of ICD-O (1990) conversion program.
(6) Second edition of ICD-O (1990) to the third edition of ICD-O (2000) conversion program.

For Finland, the site was coded to ICD-7 (1955) and the morphology using a modified version of the Manual of Tumor Nomenclature and Coding by the American Cancer Society (1951). A specific conversion program had been developed within the framework of the NORDCAN project, a collaboration between the IARC and the Nordic Association of Cancer Registries.

Although the ICD-O-3 gives clear instructions that behaviour codes /6 and /9 should not be used by cancer registries (page 27 of ICD-O-3), these codes appeared in few datasets, giving rise to problems with respect to the corresponding topography code. Usually, this was assumed to represent the site of the primary tumour. Where this was evidently not the case (carcinomas in lymph nodes, in bone, etc.), a listing of such cases was sent back to the registries with a request for clarification. As a last resort, they were recoded to topography C80.9 (primary site unknown).

Checking
Once a dataset had been converted into ICD-O-3, or if it had been originally coded using ICD-O-3 codes, it was submitted to the IARC-CHECK program, which performed the following edits:

1. Code verification

- Sex
- Incidence date and, if provided, birth date
- ICD-O-3 topography and morphology

2. Consistency between items

- Age versus birth/incidence dates
- Sex versus site
- Sex versus histology
- Age versus site
- Age versus histology
- Site versus histology
- Basis of diagnosis versus histology

Registries submitting data for Vol. IX were invited to run their own data through the IARC-CHECK program prior to submission, and a number of contributors did so (143), particularly the users of the CanReg-4 software (30), which includes the same edits. However, these datasets were automatically re-checked by the IARC secretariat. All errors or unlikely or rare combinations of items were sent back to the cancer registry for verification. The corrections or new submissions were then incorporated, converted again (if necessary) and always re-checked to ensure no more errors were found.

Multiple primaries
For the datasets that included a unique patient identification number, it was possible to check for multiple primary tumours following the IARC/IACR rules (IARC, 2004) especially defined for ICD-O-3 (see Chapter 5). The multiple primary check program can detect all the duplicate records that appeared during the reference period if the cancer registry submitted a complete dataset of the malignant cancer cases collected since the starting of registration; otherwise, some of the multiple tumours (generally those occurring at the beginning to the reference period) may not have been detected because of a lack of information on the earlier diagnoses.

Conversion into ICD-10
When no more errors remained, the incidence data were converted from ICD-O-3 to ICD-10. This ensured that the final ICD-10 codes used in the publication followed a standard ICD-O-3 to ICD-10 conversion program. When a dataset included an ICD-10 code, this was ignored in the tabulations. The ICD-O-3 to ICD-10 conversion program was written at IARC using the rules of the ICD-O-2 to ICD-10 conversion program, which was used for processing data for Volume VIII of CI5. The ICD-O-2 to ICD-10 conversion program was also developed at IARC, based on the *Conversion of neoplasms by topography and morphology from ICD-O-2 to ICD-9*. The terms deleted from ICD-O-3 (as indicated in Appendix 5) were first removed from the list of ICD-O-2. The conversion rules for the new ICD-O (M) codes (listed in Appendix 1) were defined by looking first at the most appropriate ICD-O-2 (M) code using the ICD-O-3 to ICD-O-2 conversion program, and then by applying the corresponding conversion rule to the ICD-O-3 (M) code. For example, the ICD-O-3 code M8174/3 *Hepatocellular carcinoma, clear cell type* is converted into ICD-10 following the rule that applies to the ICD-O-2 code M8170/3 *Hepatocellular carcinoma, NOS*. The ICD-O-3 codes M995_, M996_ (*myeloproliferative disorders*) and M998_ (*myelodysplastic syndromes*) that changed behaviour code from borderline (/1) to malignant (/3), and for which no ICD-10 code in the malignant 'C' category can be found, have been converted to the ICD-10 codes D45, D46_ and D47_ (i.e. non-malignant tumours). They are included and presented in the tables under the categories *MPD* and *MDS* respectively.

When a dataset was submitted with cases coded to ICD-9 or ICD-10 for topography and ICD-O-1 or ICD-O-2 for morphology, the series of conversion processes (Figure 6.2) and the final conversion from ICD-O-3 to ICD-10 produced some unexpected results and, for example, created new ICD-10 codes which were not originally recorded in the input file. For example, suppose the following combination of ICD-10 (T) and ICD-O-2 (M) was present:

ICD-10	ICD-O-2 (M)
C80	8640/3
Unknown primary	

The first conversion into ICD-O-2 (T+M) will produce the following output:

ICD-O-2 (T+M)	
C80.9	8640/3
Unknown primary	

The second conversion into ICD-O-3 (T+M) will produce the following output:

ICD-O-3 (T+M)	
C80.9	8640/3

Finally, the ICD-O-3 to ICD-10 conversion program used for the data processing will create the following ICD-10 code:

C62.9	Testis, NOS

Thus the final ICD-10 site becomes sex-specific and does not correspond to that provided in the original record. Generally, such change in ICD-10 codes will occur when the registry has not followed the rules in the ICD-O manuals; in the example above, a *Sertoli cell carcinoma* (M8640/3) should have been coded to testis (C62.9) if the site of the tumour was not specified (rule 8 of ICD-O-2 or rule H of ICD-O-3). It would also have occurred with other specific morphological diagnoses such as *malignant melanoma, regressing* (M8723/3) or *osteosarcoma* (M9180/3), which are automatically converted to an ICD-10 code for skin (C43._) or bone (C40._) cancer.

This example illustrates the importance of the primary conversion into ICD-O-3 and explains why the ICD-10 code provided by the cancer registry (if any) has not been used in the final tabulations. For certain morphological codes, the conversion is independent of topography. *Hepatocellular carcinoma* (M8170/3), for instance, is automatically converted to ICD-10 C22.0 irrespective of the ICD-O topography code (whether specific or unknown). The combination C34.9 (lung) plus M8170/3 will be converted to C22.0. This combination of topography and morphology is certainly incorrect. These types of potential errors are at the origin of the creation of the first version of the *IARC-CHECK* program. The validation of ICD-O-3 topography and histology combinations is an essential part of the data processing.

Miscellaneous conversions
In addition to the topography and the morphology codes, certain variables—sex, basis of diagnosis, ethnic group or race and dates—must be re-coded into a common schema following the instructions supplied by the cancer registry. When necessary, the basis of diagnosis variable was recoded following the IARC proposal (ICD-O-3, pg. 38). After the conversions into a common dictionary, the data corresponding to a registry are stored in the CI5 Vol. IX database, irrespective of whether they will be published in *Cancer Incidence in Five Continents Vol. IX*. All malignant neoplasms and non-malignant (except benign) neoplasms of the bladder are recorded in the database. These are stored as individual records containing the nine compulsory variables having topography and morphology coded to ICD-O-3 together with the corresponding ICD-10 code used for tabulation.

Mortality data
The mortality data are used for editorial purposes as an indicator of the completeness of registration, and are generally provided as a tabulation of ICD-9 or ICD-10 three-digit categories by sex and five-year age group, so that no validity check (except the basic combination of sex and site) can be performed. For some data sources, the original data were grouped by cancer sites or by wider age groups than the traditional five-year age groups, and had to be formatted before being handled by the series of editorial programs and stored in the CI5 Vol. IX database.

Population data
Cancer registries generally submitted population denominators for each individual year of the reference period, or for one year corresponding to the mid-year of the reference period. These are based on a census, which was carried out around the year

2000 in most of the countries. File editing and misinterpretation of the codes were the only source of errors discovered in the last three volumes. Whenever possible, the population data have been checked by comparing the age distribution with that from the previous volume. Unexpected change in the age structure or in the total population by year and sex were identified and sent to the registry for clarification. After this careful examination, the population files were formatted and stored in the CI5 Vol. IX database.

Conclusion

This protracted process for both cancer registry staff and the IARC secretariat took several months. However, it ensured a maximum level of data comparability and validity, but it is not in itself sufficient to ensure inclusion in the present volume. This depended upon other considerations of comparability and quality, as described in Chapter 5. The seven conversion programs, together with the latest version of the IARC-CHECK and the multiple primary check programs used in the incidence data process, have been published as a PC Windows™-based package, *IARCcrgTools*. This is available for free at the International Association of Cancer Registries (IACR) web site http://www.iacr.com.fr/. *IARCcrgTools* also includes the detailed definition of the edits and controls performed on each variable or within variables. All of the necessary programs to convert and check the data, then to create the tables were written in C++ and Java. The thousands of tables produced were generated in PostScript format and later converted into PDF files for publication.

The Editors would like to particularly thank Mr Mathieu Mazuir who performed most of the data entry and the data cleaning, Mr Eric Masuyer for his help in the data cleaning, and Mr Morten Ervik for his help in the data processing and his work in creating and managing the necessary tables.

Finally, the Editors would like to acknowledge the contributors who converted and checked their data prior to submission. This was very helpful and much appreciated.

Chapter 7: Age-standardisation and denominators

M. Boniol and M. Heanue

Objective

The key determinant of cancer incidence is age, as the risk of cancer increases exponentially with increasing age. The crude rate of incidence is therefore influenced by the population structure, and cannot be used alone to evaluate whether the burden of cancer differs between populations.

To compare the incidence of cancer, the summary rates should be independent of age. A common way to take into account the age structure of a population is to standardise incidence rates for age using an external (standard) population.

Crude incidence rate

The crude incidence is *the rate at which new cases occur in a population during a specific period.* This rate is classically expressed as the average number of cases occurring per 100 000 persons each year or 100 000 person-years. In *Cancer Incidence in Five Continents (CI5), Volume IX*, numbers of cancer cases are reported for the period 1998–2002. Hence the crude incidence rate is computed with the following formula:

$$\text{Crude incidence rate} = \frac{\text{Number of new cancer cases observed in the period 1998 - 2002}}{\text{Total population in the period 1998 - 2002}}$$

The total population in the period 1998–2002 corresponds to the sum of population size for each year between 1998 and 2002. This rate is called crude because it relates to each population as a whole and is influenced by the age structure of each population. It cannot be used for comparison purposes.

Age-standardised incidence rate

The age-standardised rate is a summary of the individual age-specific rates using an external population called a standard population. This is the incidence that would be observed if the population had the age structure of the standard population, and corresponds to the crude incidence rate in the standard population. The age-standardised incidence rate is expressed, as is the crude incidence rate, as the number of new cases per 100 000 person-years.

The calculation is a weighted average of age-specific rates.

$$\text{Age - standardised rate} = \sum_i \frac{d_i w_i}{y_i}$$

Such that i represents each age group,
d_i the number of cases in the ith age group,
y_i the population size in the ith age group,
and w_i the weight applied for the ith age group, with
d_i/y_i being the age-specific rates for each ith category
and the sum of w_i being equal to 100 000 to express the age-standardised rate per 100 000 person-years.

It should be stressed that the objective of age standardisation is essentially to establish rates for comparison purposes. Any population standard would enable comparison, even considering equal weights for each age group.

The most commonly used standard worldwide is the Segi standard population (Segi, 1960). Modified by Doll et al. (1966), it was based on the age structure of the pooling of populations

Table 7.1 Computation of age-standardised incidence rates (Melanoma cancer, Denmark, males, 1998–2002)

Age group	No. of cases	Person-years at risk	Age-specific incidence (per 10^5 years)	Standard world population	Expected cases in standard population
i	d_i	y_i	$10^5(d_i/y_i)$	w_i	$d_i w_i/y_i$
0–4	0	869 668	0.00	12 000	0.00
5–9	0	878 535	0.00	10 000	0.00
10–14	0	779 915	0.00	9 000	0.00
15–19	7	723 313	0.97	9 000	0.09
20–24	23	840 592	2.74	8 000	0.22
25–29	59	961 907	6.13	8 000	0.49
30–34	83	1 042 749	7.96	6 000	0.48
35–39	117	1 041 800	11.23	6 000	0.67
40–44	153	953 731	16.04	6 000	0.96
45–49	188	930 210	20.21	6 000	1.21
50–54	262	990 187	26.46	5 000	1.32
55–59	303	871 969	34.75	4 000	1.39
60–64	272	649 423	41.88	4 000	1.68
65–69	223	523 486	42.60	3 000	1.28
70–74	217	439 676	49.35	2 000	0.99
75–79	162	342 435	47.31	1 000	0.47
80–84	119	210 084	56.64	500	0.28
85+	115	140 073	82.10	500	0.41
Total	2 303	13 189 753	17.46	100 000	11.94

from 46 countries. The use of this standard population allows international comparison and evaluation of changes in incidence by comparing them to rates published in previous volumes of CI5. An example of this age standardisation appears in Table 7.1.
In this example, the crude rate is 2303 / 13 189 753 = 17.46 cases per 100 000 person-years, and the age-standardised rate is 11.94 per 100 000 person-years.

The age-standardised rate is lower than the crude rate because the standard population is on average younger than the Danish population. However, the rate of 11.94 can be compared with other rates standardised on the world population.

Reference population
A new standard population was proposed by WHO in 2000 (Ahmad *et al*., 2000). This new standard allows the estimation of incidence for the theoretical world population. This new population is, however, not of great utility for cancer incidence standardisation for two main reasons:

This new standard population is supposed to better represent the theoretical world population compared to Segi's population, but still does so insufficiently, as population data is lacking for many regions in the world. Secondly, there is no additional statistical property from this standard to the Segi population for comparison purposes (Bray, 2002). For data in the present volume, for all cancer incidences excluding non-melanoma skin cancer, we estimated the Spearman correlation (r) between the rates using Segi's standard compared to the new standard. The percentage of variation not explained by the new standard compared to the old standard ($1-r^2$) was 0.14% for men and 0.11% for women. When looking at ranking of registries by level of incidence, the new standard produces an average change of 2.9 rank levels for men and 1.9 for women in data including all registries; this corresponds to an average of 0.7% change for men and 0.5% change for women. The lack of clear difference between incidence rates computed with Segi's population compared to the new world standard does not justify the use of the new population.

For these reasons, and to allow international comparisons with continuity from the previous volumes, we use here only Segi's world standard.

Cumulative rate
The cumulative rate is an approximation of the probability to develop a cancer during a certain period—for example, a lifetime. We present the cumulative rates for the life spans of 0–64 and 0–74 years. This has the advantage of summarising the age-specific rates independently of the age structure of the population, and gives the probability of an individual developing a cancer. This calculation is theoretical and assumes that no death occurs in the period, and that the age-specific incidence rates will be stable for an individual.

$$\text{Cumulative rate between 0 - 74 years old} = 5 \times \sum_{i=1}^{15} \frac{d_i}{y_i}$$

Such that i = 5-year age groups,
d_i=number of cases in the ith age group, and
y_i=number of person-years in the ith age group.

The cumulative incidence rate ranges between ages 0 and 75, and by its construction overestimates the probability of developing a cancer during life when incidence rates are high. However when incidence rates are sufficiently small, apart from all cancer sites combined, the cumulative rate is not significantly affected by this bias.

In the previous example for melanoma in men in Denmark (Table 7.1), the cumulative rate can be estimated from the age-specific rates:
The sum of the age specific rates between ages 0–74 is: (0.97 +2.74+6.13+7.96+11.23+16.04+20.21+26.46+34.75+41.88+42.60+49.35)/100 000 = 260.33/100 000. Hence the cumulative rate is (260.33/100 000) × 5, or 1.3%.

The age-specific incidence rates calculated in a registry are derived from different birth cohorts; i.e. populations born at different periods who experienced different levels of exposure to carcinogens. The cohort effect is an important determinant of the observed incidence for most cancer sites. For example, mesothelioma incidence is driven by asbestos exposure that took place in the past (until the 1990s in most developed countries), and the cumulative rates calculated in CI5 Volume IX would not reflect the lifetime risk of mesothelioma of a population born in 2000.

Nevertheless, the cumulative rate reflects the burden of cancer in a place, and has the added advantage over the age-standardised rate of not imposing an external population structure.

Statistical tests
Statistical tests, the results of which are not published here, were used to flag certain registries as 'unusual' or possibly inconsistent with previous published data.

Calculation of variance of ASRs
Variances of age-standardised rates (ASR) are used to assess the statistical significance of the difference between rates in Volume VIII and Volume IX and to compute confidence intervals of rates in Volume IX. We based the estimation of variance of ASR on Breslow and Day's method modified to use a binomial assumption (Keyfitz, 1966) for the variance of the crude age-specific rates.

$$Var(ASR) = \frac{\sum_{i=1}^{18}\left(\frac{d_i * (y_i - d_i) * w_i^2}{y_i^3}\right)}{\left(\sum_{i=1}^{18} w_i\right)^2}$$

We estimated 95% confidence intervals (CI) of rates based on an assumption of the normal distribution of the rates.

$$CI = \pm 1.96 * \sqrt{Var(ASR)}$$

Comparison of ASRs from Volume IX with the values from Volume VIII
To identify significant changes in incidence between Volume VIII and Volume IX we estimated the Comparative Incidence Figure (CIF), which corresponds to the ratio of the age standardised incidence rate in Volume IX divided by the age-standardised rate in Volume VIII.

$$\text{Comparative Incidence Figure} = \frac{ASR_{\text{from Volume IX}}}{ASR_{\text{from Volume VIII}}}$$

The upper (CI_u) and lower (CI_l) 95% confidence interval limits of CIF were computed using the following formula:

$$CI_{u/l} = e^{Ln(CIF) \pm 1.96 * \sqrt{\frac{Var(ASR_{\text{fromVolume IX}})}{ASR_{\text{fromVolume IX}}^2} + \frac{Var(ASR_{\text{fromVolume VIII}})}{ASR_{\text{fromVolume VIII}}^2}}}$$

We considered the difference between rates in Volume XI compared to rates in Volume VIII to be significant if the value 1.0 was not included within the 95% confidence interval of the CIF.

Comparison of percentage of microscopically verified cases (MV%) from volume IX with the values from volume VIII
We estimated the Z statistic as:

$$Z = \frac{\left| Ln\left(\frac{V_{VIII}}{nV_{VIII}}\right) - Ln\left(\frac{V_{IX}}{nV_{IX}}\right) \right|}{\frac{1}{V_{VIII}} + \frac{1}{nV_{VIII}} + \frac{1}{V_{IX}} + \frac{1}{nV_{IX}}}$$

With V_{VIII} and V_{IX} being the number of cases microscopically verified in Volumes VIII and IX, respectively, and nV_{VIII} and nV_{IX} being the number of cases not microscopically verified in Volumes VIII and IX, respectively.

We considered the difference in the proportion of microscopically verified cases to be significant if Z was greater than 1.96.

Population at risk
Population at risk figures are used as denominators in the formulas for the calculation of incidence rates, crude or adjusted. These denominators are often disregarded, and readers tend to only focus on the final incidence rates and discuss the variability in incidence data gathering (completeness, classification). This notion is driven by the age standardisation process, which tends to eliminate the effect of population age structure and gives the reassuring but false impression that population structure is no longer influencing the incidence rates. It must be stressed that denominators are an essential part of the calculation of incidence rates, and have their own biases and limitations that must be kept in mind. The age standardisation process is not intended to solve imprecise population size estimation.

Numbers of population at risk are routinely collected by registries from official statistical offices for example and registries provided these figures to Cancer Incidence in Five Continents along with their incidence figures.

Comparability
Population size estimates are frequently calculated by the official statistical office using the results from a census and a projection for the years following the most recent census. The closer the year a population estimate is to a census date, the more accurate the estimate will be. Therefore when countries do not have the same census year, there will be differences in the precision of their population estimate. Moreover, population estimates are often revised once a new census is available but not all cancer registries collect these updated figures. Hence the drift and even a significant change in incidence rate between the year of the census and the preceding year could occur simply because of the imprecision of the population estimate. This is especially true when population sizes are small and susceptible to more variability, for example, when there is migration within a country.

Despite these considerations, for most countries contributing to CI5 a census occurred during the period 1998–2002. Hence, we can expect that the biases described earlier could be largely alleviated. However, in some registries the population figures were estimated from a census performed more than 10 years before the period used in *Cancer Incidence in Five Continents, Volume IX*.

Another limitation in the population figure is the choice of the date in the year for population estimate. The best estimate of the population at risk for a specific year in which cancer incidence was observed is considered to be at mid-year, and some registries provided yearly population estimates for the 1st of July. However, this is not a systematic practice and many registries provided populations statistics estimated at the beginning of the year, using the 1st of January. In a population that increases, the use of 1st of January for population size could induce a systematic overestimation of incidence rates. It is expected to have only a minor influence in *Cancer Incidence in Five Continents*, which uses a period of 5 years combined.

Migration
Population size could also be overestimated or underestimated if migration flux patterns are not considered. Some registries collected population data corrected for immigration and emigration. Between-country migration is often better handled than within country migration, which is of major concern to regional registries tasked with maintaining optimal coverage of their population. Indeed, populations of a highly nomadic nature make the production of inter censal population estimates a real challenge. Hence incidence figures for these populations must be evaluated with care, and their comparability is to be questioned.

A few words of caution
Cancer is a disease that mainly occurs at older ages, and standard populations such as Segi have the tendency to give more weight to incidence in young age groups and hide differences observed in older populations. Therefore it cannot be stressed enough that neither the age-standardised rate nor the cumulative rate are alternatives to the age-specific incidence rates, which should always be the starting point and foundation of any thorough analysis of the incidence data.

South Atlantic Ocean

Algeria, Sétif

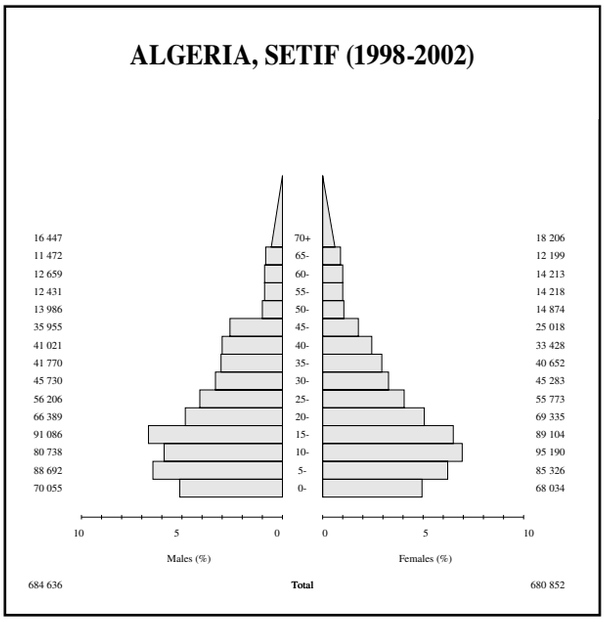
Registration area

The Sétif Cancer registry covers the population of 10 *dairates,* which include a total of 60 communes. The population at the last census (1998) was 1 299 117, representing 4.33% of the overall Algerian population making it the second-largest population centre after Algiers. The population growth rate for this area in 2001 was 1.8%. About 48% of the population live in rural areas, and 99% are Sunni Muslims. The *Wilaya* (province) of Sétif covers an area of 6504 km^2, corresponding to 0.27% of the country. The *Wilaya* of Sétif is the capital of the highlands, having an altitude of 1300m and a semi-arid continental climate. It represents 4.7% of the national population at a density of 213 inhabitants per km^2.

Cancer care facilities

General health care in the region is provided predominantly by the CHU (University Hospital Centre) and 6 other hospitals, 16 health centres and 55 primary care centres. These are supplemented by private practitioners and hospitals for a total of 2115 beds, or 1 bed per 690 inhabitants. The total number of health workers is 5772: 215 public specialists, 198 private specialists, 387 public generalists, 278 private generalists, 2944 public nurses and 50 private nurses.

The CHU, located in Sétif, provides cancer surgery and chemotherapy services. Radiotherapy is provided by the cancer centres of Constantine (120 km distant) and Algiers (300 km distant), and as a result many patients are treated in Algiers and Constantine. All breast cancers are treated at the breast health centre in Algiers. A large new Cancer Centre is now being implemented in Sétif, and is expected to provide care for all cancer patients from the area of about 5 million inhabitants in 2008.



Registry structure and methods

The registry, founded in 1989, is located in the epidemiology and preventive Medicine service of the Hospital Mere Enfant of the CHU in Sétif under the auspices of the Ministry of Health and Ministry of Research and Education. The registry is staffed by two epidemiology assistants, one pathology assistant, one technician in epidemiology, and 3 postgraduate students in epidemiology.

The Sétif Cancer Registry uses active case finding from 16 sources of data consisting of University Hospital Centres, cancer hospitals, public health hospitals, pathology laboratories, private hospitals and offices, insurance offices, other cancer registries in Algeria and death registration offices. The death registration system is incomplete; the certificates of death are examined and a record completed for each certificate mentioning cancer or malignant tumour. Collection is primarily active. For each patient we collect data from four or five different sources, which permits the information to be completed and checked before coding. For each cancer case a limited number of variables (18) have been put into a sample record. The variables include the sources of information. For the tumour, only four variables are collected, including the date of diagnosis, the site, and the morphology. The data are coded according to ICD-O. Impossible or improbable combinations (site, sex, age and morphology) are identified by computer. Duplicate registrations have been reduced to a minimum thanks to a careful control of name, sex, date of birth and diagnosis. The registry staff visit these sources once a month.

Interpreting the results

Arrangements have been made with the hospitals outside the registration area to notify the registry of any area-resident cancer cases that they may diagnose and treat. These outside hospitals are visited regularly to collect records, but some small underestimation due to cancer cases treated outside the area is possible.

Uses of the data

The registry has prepared a report of cancer incidence from 1986 to 2005, with 20 years of registration highlighting trends and changes. A study of survival of registered cancer cases of breast, colon, rectum, large bowel, and prostate during 1990–1994 has been carried out within the CONCORD Survival study.

Source of population

The populations of 1999 – 2000 – 2001 – 2002 are estimated on the basis of the1998 National Census.

Multiple primary rules used

IACR rules (2000)

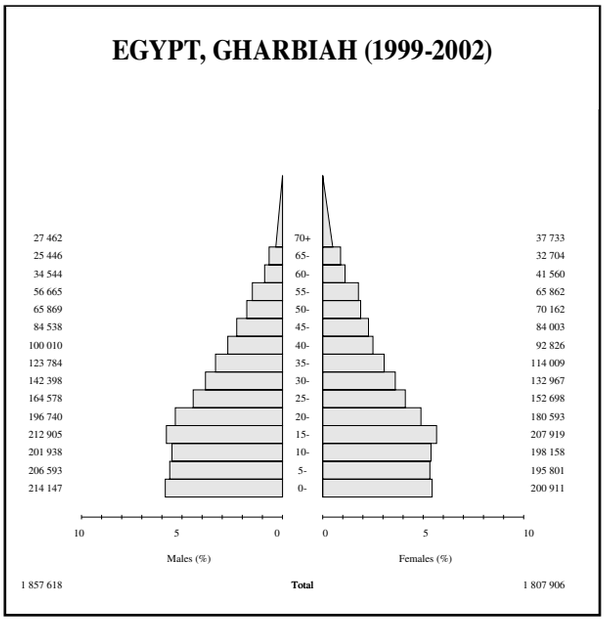
Notes on the data

The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Egypt, Gharbiah

Registration area
The Gharbiah Population-based Cancer Registry (GPCR) covers the population of eight districts (Tanta, Elmahalla Elkobra, Kafr Elzayat, Zefta, Kotour, Elsanta, Basyoun & Samannoud) within the state of Gharbiah, in the west and central Delta region in lower Egypt. The population at the most recent census (1996) was 3.406 million (5.7% of the total population of Egypt). About 40% of the population lives in urban areas. The majority are Moslems and the remainder are Christians.

Cancer care facilities
General health care in the region is provided predominantly by the Gharbiah Health Services Department (Ministry of Health and Population), through the district hospitals and a network of primary health centres. These are supplemented by Tanta University Hospitals, insurance hospitals and clinics, private practitioners and private hospitals. The Tanta Cancer Center (TCC) is located in Tanta, the principal town and capital of Gharbiah, and provides cancer surgery and chemotherapy services. Gharbiah Cancer Society (GCS), NGO, and the radiotherapy department at Tanta University Hospital in the vicinity of Tanta Cancer Centre provide radiotherapy services. In the registry area, patients at the primary and secondary care facilities suspected to have cancer are generally referred to TCC or to one of the two hospitals with comprehensive cancer services within a 60-km radius (Mansoura Urology Center & Mansoura Gastroenterology Center) or to the National Liver Institute, Menoufeya University (40 km distant), or occasionally to National Cancer Institute, Cairo University (100 km distant).



Registry structure and methods
The registry is located within TCC, and is sponsored by MECC, the US National Cancer Institute in Bethesda, USA, and the Ministry of Health and Population, Cairo, Egypt. A principal investigator, executive director, two co-investigators and field supervisors, two data managers, four part-time registrars and four full-time secretaries staff the registry.

The Gharbiah Population-based Cancer Registry (GPCR) uses active case finding from 57 sources of data consisting of cancer hospitals, general hospitals, university hospitals, insurance hospitals, private hospitals and clinics, specialized hospitals and centres, pathology and haematology labs and the district death registration offices.

The death registration system is adequate; the cause of death from cancer is often mentioned. The registry staff visit these sources, where they scrutinise the records kept in medical records departments and the registers of individual departments concerned with diagnosis and treatment of cancers in order to identify and abstract information on cases of cancer, diagnosed by all methods, among residents of the registry region.

Although cancer is a notifiable disease by administrative order (without a specific law), few registration forms are received from private practitioners. Arrangements have been made with the hospitals outside the registration area to be visited every 1–3 months according to workload in order to abstract resident cancer cases which are diagnosed and treated in them.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but underdiagnosis probably occurs for elderly subjects in rural areas. TCC has a full range of diagnostic facilities, so that it is unlikely that cases referred will be missed.

There is a breast cancer early detection program in Tanta Cancer Centre. PSA testing is not common in this population.

Bladder cancer, which is the most common cancer in Egypt, is related to Schistosomiasis, which is currently being eradicated. Smoking is becoming the most important risk factor for bladder cancer. Liver cancer incidence is high compared to almost all countries in the world except some in Asia and Africa; this could be attributed to high prevalence of the hepatitis virus, mainly HCV. Aflatoxin contamination might be another risk factor. High incidence of NHL is another characteristic feature in Egypt, but no specific culprit risk factor for this has been identified.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. Some specific studies of survival of registered cancer cases (breast and liver cancer) have been carried out.

Source of population
The estimate of the population–at–risk is based on the 1996 census, making allowance for births and deaths, but it was not possible to estimate migration into and out of the registration area.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Tunisia, Central Region

Registration area

Tunisia, an Arab-Islamic North African country, is usually divided into three regions: the northern, the central and the southern region. The Central Region registry includes six provinces: Sousse, Monastir, Mahdia, Kairouan, Kasserine and Sidi Bouzid.

Sousse province, with an area of 2669 km^2 and the capital of the central region, had a 2000 population of 495 000, 18.3% of the overall population of the central region (2 697 200). The population is relatively young, with 48.1% being under 20 years of age, and 8% being over 60 years.

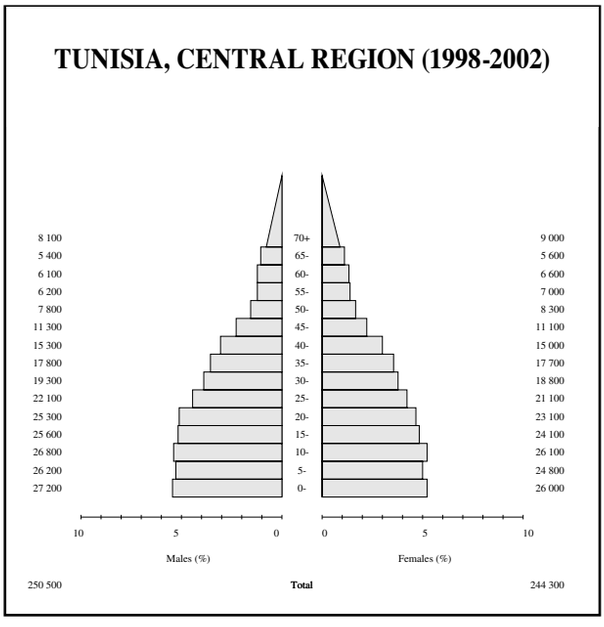
The main economic sectors of the region are agriculture, industry (textile) and tourism.

Registry structure and methods

The registry of the central region, staffed by four full-time physicians, is located in the Department of Pathology of the University Hospital of Sousse.

The search for new cases is proactive, which means that the registry does not wait to be informed, but actively looks for information from certain specific sources. Primary sources include the Departments of Pathology of the public and private medical centres (five, three of which are in Sousse). The other primary sources are the Departments of Radiotherapy (in Sousse), Oncology (in Sousse) and Haematology, in addition to the other 24 departments of the University Hospital of Sousse.

In addition to the histologically confirmed cases, more and more cases have been discovered in recent years without microscopic confirmation and are related to the gall bladder, the pancreas, the prostate, the lungs and the ovaries.



Interpreting the results

The registry counts all of the new declared cases of cancer in the entire central region of Tunisia. Nevertheless, apart from the province of Sousse where the completeness reaches 97%, a lack of completeness is observed in the other 5 provinces. We suggest therefore studying the epidemiological particularities of that province and not of the whole region. Moreover, we have encountered other practical difficulties related to the systematic declaration of cancerous diseases, changes in patient names, and the lack of information on the evolution of patients (treated outside the hospitals of Sousse or lost).

These difficulties are also due to the lack of precision in issued death certificates, which can be a source of information on the evolution of the diseases.

We have two national screening programs concerning cervix and breast cancer. PSA testing is done only in university institutions; to date there is no large screening program for prostate cancer.

Use of the data

The registry develops an annual report on the incidence of cancer in order to define the epidemiological profile of the region and compare it with those of the north and south regions of Tunisia and those of other countries. Certain special studies of five-year survival of cervical cancer, breast cancer and lung cancer have been performed.

Our registry is involved in some epidemiological research, especially in cancer genetics. Our registry is used as a base for planning and providing some health services, for example providing instruments for new cancer diagnosis and treatment (radiation, new-generation CT scans, and mammographs).

Source of population

1998–2002 estimates (Institut National de Statistique) based on the 1994 census.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Notes on the data

The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Uganda, Kyadondo County

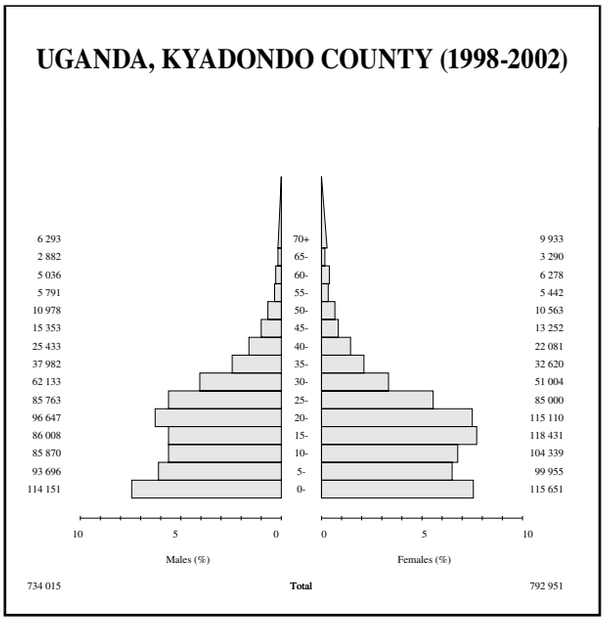
Registration area

The Kampala Cancer Registry collects data on the population of Kyadondo County, which includes the city of Kampala (the capital of Uganda), with its peri-urban areas and an area extending 30km to the north. This population, which is mainly urban (80%), is composed of the Ganda ethnic group (50%) and other ethnic groups (30%). There are also immigrants from neighbouring countries, particularly from Kenya and Rwanda. Europeans, Asians and other nationalities make up 1% of the population.

The major activities of the residents of the capital include administration, trade, professional and para-professional activities, personal services, and plant and machine operation. There are no major industries in the county; subsistence farming is carried out on the outskirts of the capital.

Fifty percent of the population are Catholic, 30% Anglican, 15% Muslim and 5% other.

Staple foods consumed by the population of Kyadondo County include matoke (steamed green banana), posho (maize bread), beans and groundnuts. About 50% of the city dwellers receive chlorine-treated piped water from the freshwater Lake Victoria.



Cancer care facilities

Kyadondo County is served by a 900-bed national referral hospital, Mulago Hospital, which is well equipped with modern diagnostic facilities. Mulago, which is also a teaching hospital for Makerere University Faculty of Medicine, is well supplied with consultants and teaching staff in all disciplines of medicine. An oncology unit involved in chemotherapy for various types of cancer and a radiotherapy unit are attached. The county has three other missionary hospitals with 100 beds each. The Uganda Hospice provides services for the care of terminal cases of cancer in addition to other terminal diseases. Two private histopathology laboratories provide additional histological data to the registry.

Registry structure and methods

The Kampala Cancer Registry is situated in the Department of Pathology, Faculty of Medicine, Makerere University. Personnel include a pathologist director, a cancer registrar and an assistant cancer registrar. All are employees of Makerere University.

However, in various hospitals and units the registry has recruited personnel to assist in coordinating collection of data. Submission of data to the registry is voluntary, as cancer is not a notifiable disease, and registration is almost entirely active. Doctors report a few cases to the registry directly. For hospitals, hospices and histopathology laboratories, the registrars visit at least once a month and consult the hospital records, which include admissions and discharge registers, clinical notes and pathology reports. For each case both demographic and cancer diagnostic data are sought. Certification of death is only carried out for legal reasons, and is very incomplete, so death certificates are not used as a source of information.

The registry is computerised, and data management is carried out using the IARC/IACR CanReg software, which includes checks for consistency and validity and permits a search for potential duplicate registrations.

Patient confidentiality is ensured by using only registration numbers during analysis of data. The registry is off-limits for unauthorised persons.

Completeness of registration was evaluated at 90% for the period 1994–1996 (Wabinga et al, *Cancer Causes & Control* 2001; 12:147-52)

Interpreting the results

Since its inception in 1951, the county covered by the registry has not changed its boundaries. However the population is becoming increasingly urbanised as the city expands. Immigration is also increasing as part of the worldwide trend of rural to urban migration. Another factor that may influence incidence rates is the improvement in availability of diagnostic services, particularly in the national referral hospital

Screening programmes for cancer are not organised, but with the health-oriented population of the county, many patients seek screening services. PSA testing, mammography and Pap smears are done on an individual basis.

Uganda was one of the first countries to be severely affected by the HIV/AIDS epidemic, and this has profoundly influenced the pattern of cancer in Kyadondo County (Wabinga et al, *Int J Cancer*. 1993; 54:26-36). However, as a result of vigorous national campaigns, prevalence of HIV infection is now falling—according to UNAIDS, prevalence in pregnant women in Kampala fell from 18.5% in 1995 to 13.8% in 1998 and 8.3% in 2002. This, together with the slowly increasing availability of anti-retroviral therapy, will result in changes in the incidence of AIDS-related cancers.

Use of the data

The registry provides the longest continuous time series of cancer incidence in Africa. This makes the data of special value in cancer surveillance and research, particularly to monitor the effects of the HIV/AIDS epidemic and to serve as the baseline for analytical studies and intervention studies. The registry has also published the first population-based estimates of cancer survival in sub-Saharan Africa.

Source of population

The population at risk is based on the results of the 1992 and 2002 census data, with intercensal years estimated from the observed rate of growth within 5 year age groups.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Notes on the data

The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

This registry has the lowest histological verification rate in the monograph.

Zimbabwe, Harare

Registration area
Harare is located in north-eastern Zimbabwe and is the capital city. The population of the city according to the 2002 national census was 1.9 million. The national population was 11.6 million.

Cancer care facilities
The current difficult economic situation currently in Zimbabwe is negatively affecting healthcare delivery, particularly in the public sector. In spite of this, the system in Harare, based on a network of primary health care facilities provided by the municipality, government-funded referral facilities and a private sector that caters mainly to middle- and higher-income groups, continues to perform reasonably.

Registry structure and methods
The Zimbabwe National Cancer Registry (NCR) was established in 1985 in Harare as a result of an agreement between IARC and the Zimbabwean Ministry of Health. The target population of the registry is that of Harare city, and adequate population coverage was achieved in 1990. Although the registry records all cancer patients identified from its diverse sources irrespective of residence, the present data for 1998–2002 are confined to the Harare city population.

The activities of the registry are overseen by a constituted advisory committee, and the day-to-day administration is the responsibility of the registrar under the guidance of the medical director. The registry has four full-time staff comprising the registrar, secretary and two data collection clerks. It is strategically located at Parirenyatwa Hospital, a large government referral centre and also the location of the University of Zimbabwe College of Health Sciences. The registry is supported by the Ministry of Health and Child Welfare, the IARC and other organisations.

Case-finding is mainly active, with the registry staff visiting institutions within the healthcare delivery system which are involved in the management of cancer patients.

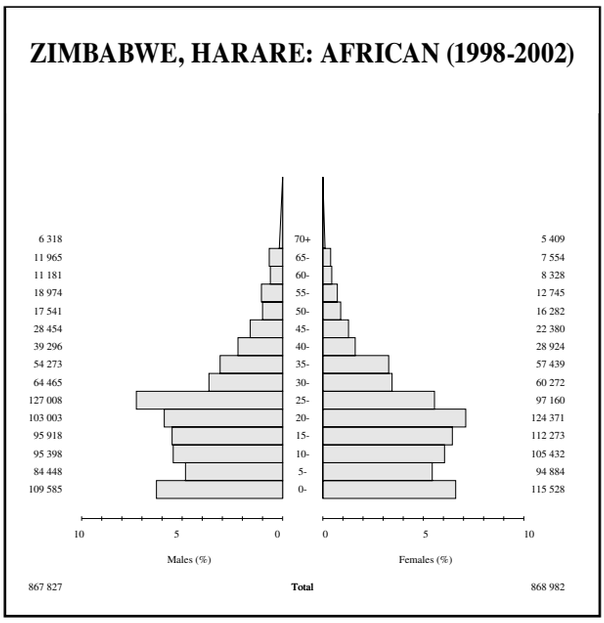
The registry information sources include:

- Routine weekly visits to the inpatient wards of the two government central referral hospitals (Harare and Parirenyatwa);
- Medical records of discharged and deceased cancer patients from the two central hospitals and visits to oncology outpatient clinics;
- Histology reports from the public and private sectors, medical records of the radiotherapy department, death certificates of patients dying of cancer in greater Harare, and records of specific clinical research studies.

Hospital inpatients are interviewed to verify the accuracy of reported age, residential status and other demographic data. Information recorded on each case includes sex, date of birth or age, residence, racial group, basis of diagnosis, tumour site and histology. Residence status is defined as the patient's place of residence during the previous six months.

All notifications coming into the registry are thoroughly vetted to ensure that only incident cases are recorded. Incident cases are verified by the treating doctors to confirm the diagnosis, and completed forms are coded. The data are stored electronically using the IARC/IACR CanReg system. Patient name lists are generated periodically to physically eliminate duplicates.

When several lesions of the same histological type occur in a patient, only the first lesion is recorded. Subsequent lesions are ignored. For example, the incidence of non-melanoma skin cancer is very high in the white community of Zimbabwe, and many patients develop several lesions of the same histological type during their lifetime. However, if basal cell carcinoma and squamous cell carcinoma of the skin occur in the same patient affecting the same or different sites, they are recorded separately.



Use of the data
Data from the registry are extensively utilised by both indigenous and foreign researchers, lecturers, students, conference participants, health educators, and the Ministry of Health and Child Welfare for management planning and cancer control programmes.

Source of population
Claimed to derive from the 2002 census, but the data do not correspond to the period 1998-2002.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).
This registry has the lowest histological verification rate in the monograph.

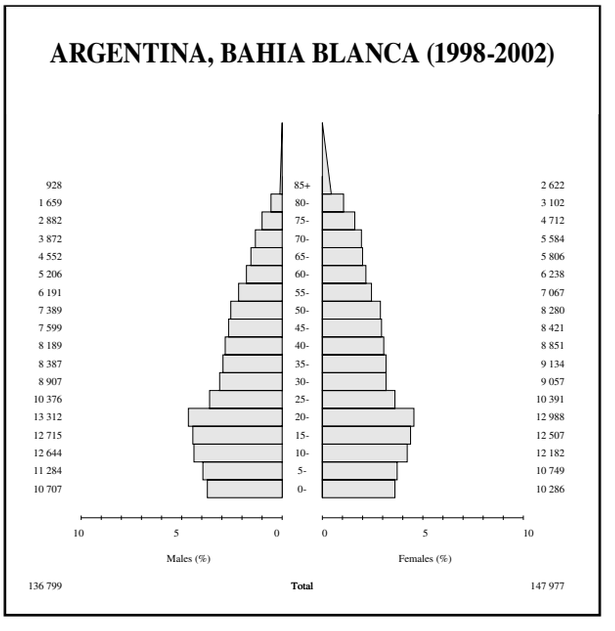
Central and South America

Argentina, Bahia Blanca

Registration area
The Regional Tumor Registry of the South of the Province of Buenos Aires covers an area corresponding to 15 political areas, with a population of 627 505 inhabitants in 2001. The data presented are for the political area of Bahia Blanca (population 284 776) only.

Bahia Blanca is mainly an urban area, with a large petrochemical industry. The remainder of the population lives in small rural villages.

Practically 100% of the population is white, most of them descended from European immigrants who arrived during the late 19th and early 20th centuries. In some political areas, such as Coronel Suarez, there are settlements of German descendants. In the south of the province, there is a varying population of workers who come from Chile for the onion harvest, but the permanent Chilean population amounts to less than 5%. The predominant religion is Catholic, but there are also other Christian minorities.



Cancer care facilities
The two public hospitals of the area have oncology services. Surgery is performed in the general surgical services. There are two private radiotherapy institutes, which also treat patients from public hospitals; one has a linear accelerator. Computerised tomography is available in almost all of the larger public and private institutions, and one of them has a nuclear magnetic resonance imaging facility.

Registry structure and methods
Although the registry was recognised by Provincial law and a municipal resolution in 1993, it still does not have a specific budget. It is based in the Dr. Jose Penna General Hospital and its Director has been appointed Chief of the Biomedical Investigation Unit, but no specific personnel or funds have been assigned. The Argentinean Association for Education and Prevention of Cancer, a non-profit organization founded in 1986 to improve cancer control, maintains the registry and other high-priority activities of the Association, such as the Tobacco Control Programme. Although its resources are limited, it is able to pay for a registrar, and has provided small fellowships for training young students. Some support has been received from IARC. The foundation Alberto J. Roemmers provided funds for epidemiological research in 2000–2001, and the National Ministry of Health in 2004.

Data collection is mainly active. The sources of cancer cases are public, private and military hospitals, as well as pathology laboratories and a flux cytometry laboratory. We also visit Radiotherapy Institutes and haematology doctor's offices.

Data management is carried out using the IARC/IACR CanReg software.

Interpreting the results
There have been few changes in the population since the establishment of the Registry. The Registry has more information sources for this period compared to in 1989–92 and 1993–1997, so the data are now more complete.

There are no organised screening programmes within the region. PSA is used more frequently, but it is not possible to determine the proportion of the male adult population screened.

Use of the data
Reporting of incidence is considered the most important activity of the registry, as population-based cancer registration is so limited in the country.

In combination with the registry, the Epidemiological Investigation Unit on Cancer performs some tobacco control activities.

During the last three years we have been consulted at the national and provincial levels to develop new cancer registries, and we have trained professionals and technicians in the provinces of La Pampa and Jujuy, where new cancer registries have recently been established.

The registry is currently involved in epidemiological research, and policymakers use our data for planning and evaluation of health services.

Source of population
The estimate of the population–at–risk is based on the 2001 Census.

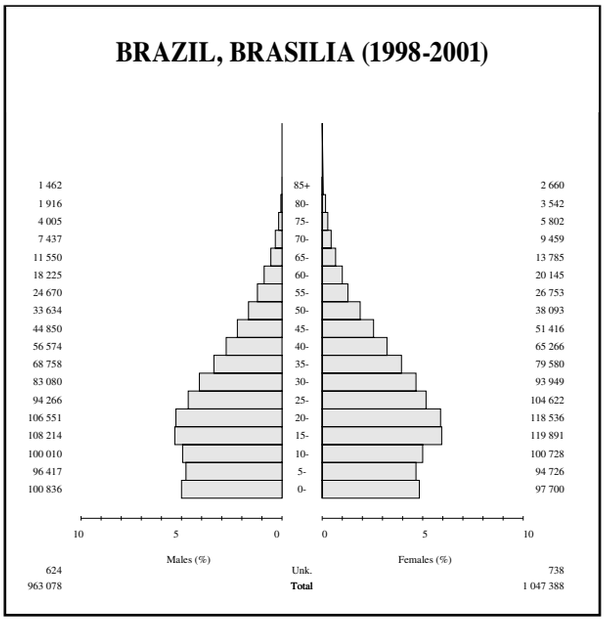
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Brazil, Brasilia

Registration area
The PBCR Federal District (DF) covers the capital city, in the Mid-West region of Brazil. It is located between 15º30' and 16º03' South latitude and 47º25' and 48º12' West longitude, covers an area of 5 789.16 km², with 255.25 km² being urban and 5533.91 km² being rural. The climate includes tropical savannas and temperate rainy areas with dry winters; annual average temperature is 20.5ºC (69F) with average air humidity varying between 39 to 83%, being lowest in August and September and highest in December. The altitude is between 1000 and 1152 meters above sea level.

The last demographic census carried out in 2000 by the Brazilian Institute of Geography and Statistics (IBGE) disclosed that in the DF, the resident population was 2 139 580 inhabitants (1 069 790 women and 981 356 men), distributed in 28 Administrative Regions, with 4.2% (89 647) in the rural area. The vast majority of the population is Catholic.

Interpreting the data
The life expectancy for those born in 2000 was of 69.24 years. Currently, the Federal District as well as the whole country is experiencing rapid and expansive demographic change, with an aging population and consequent increase in the chronic degenerative illnesses reflected in mortality statistics. In 2002, cardiovascular illness was the most frequent cause of death in the DF, representing 27.7% of all deaths, followed by cancer (16.6%). In 1979 cancer was responsible for 9.4% of the deaths in the DF; therefore, from 1979 to 2002 cancer mortality increased by 76%. The Ministry of Health (MS) has been publishing data on causes of mortality in Brazilian capitals since 1944. In 1975, the MS implemented the Subsystem of Information of Mortality (SIM), defining the national model of death certification and centralising the processing and annual publication of these data. The quality of information in the DF is partially attributed to low levels of unclear causes of mortality (0.8–5%) in the last five years, the lowest rate among states of the federation. A study carried out in 130 480 deaths in the DF from 1979–1988 disclosed that 16 098 deaths had cancer as the primary cause; 41.3% of the deaths had been verified through autopsies. However, in the deaths caused by cancer, only 12.2% were submitted to necropsy; the younger the patient the higher the number of autopsies. Thus, the fewest autopsies were performed in patients over 74 years old.



Cancer care facilities
In 2002 the DF had 60 hospitals: 14 state-provided, 5 federal and 41 private. Early Detection programs are available in basic care units (68 Health Centres and Units with Family Health Program - PSF), and in the regional referral units (10 Regional Hospitals). The Federal District has High Complexity Centres of Cancer Treatment (CACON) at 3 hospitals.

Registry structure and methods
The Epidemiology and Regulation Management coordinates the Population-Based Cancer Registry in the DF and supervises, assesses and monitors the hospital-based cancer registries in this district. In the DF there is a Skin Cancer Registry that assesses skin cancer cases diagnosed in the public health system.

The PBCR of the Federal District registers all the cases of cancer (invasive and *in situ*) and benign CNS tumours (in children and adolescents under 19 years old) diagnosed in the DF resident population. Cancer is not a notifiable disease. The main sources of data collection are located in pathology labs, health information systems, hospitals and private oncology clinics.

The PBCR initiated its activities on 27 November 1997 and follows the rules of the National Institute of Cancer/Brazil (INCA). It uses SISBASEPOP/INCA software and it has published data referring to the years 1996–2001.

Use of the data
The Cancer Registry works in cooperation with Cancer Care Coordination, which is responsible for planning, evaluating and executing the Oncological Plan for the DF. The structure of the coordination includes Care Delivery Management, Primary Prevention Management, Early Detection Management, Epidemiology and Regulation Management, Financial and Human Resources Management, Palliative Care Management, and Evaluation, Teaching and Research Management. It is responsible for planning and coordinating health promotion, prevention and care activities in the district.

Source of population
Census 2000. 1998, 1999, 2001, 2002 estimated by Brasilian Institute of Geography and Statistics (IBGE/DATASUS).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

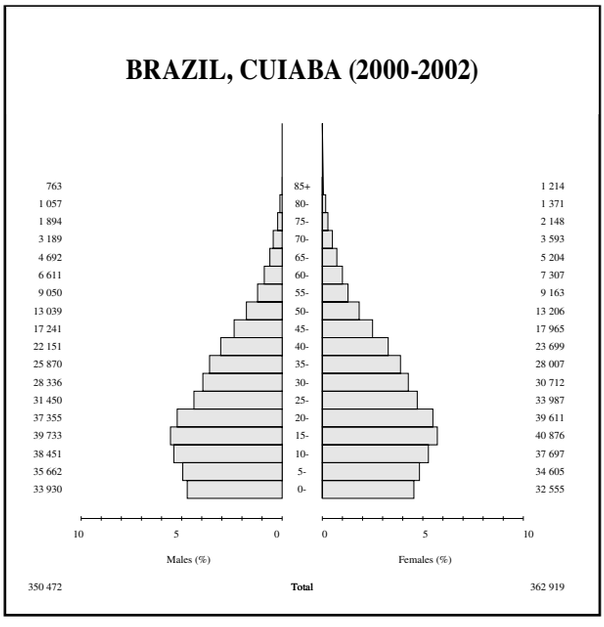
Brazil, Cuiaba

Registration area
The PBCR of Cuiabá covers the cities of Cuiabá and Várzea Grande, in the Midwest region of Brazil. Cuiabá and Várzea Grande have a total area of 4482 Km^2. About 98.44% of the population (some 686,481 inhabitants) lives in urban areas, and the annual growth rate is 2.72% for Cuiabá and 2.66% for Várzea Grande.

The city of Cuiabá is 177 meters above sea level, and Várzea Grande, 191 meters. The climate is continental tropical, with a mean annual temperature of 33ºC.

Cancer care facilities
The State Cancer Control and Prevention Coordination of the State Health Secretariat of Mato Grosso has been working to meet the needs for those who work in the field of oncology, supporting prevention and delivery of care actions, research and epidemiological studies.

Health programs and services are provided by 4 public hospitals and 1 private hospital, with 162 public beds (2.3 per 1000 inhabitants). There are also healthcare units with cancer prevention and early detection facilities. Other cancer diagnostic and treatment facilities include: two radiation therapy clinics, 5 chemotherapy clinics, and 10 pathology labs. There are 22 universities, 3 of which have medical schools.



Registry structure and methods
The PBCR was established in 1999, and data collection started in the year 2000. It is located in the Health Care Department of the State Health Secretariat of Mato Grosso, and has fixed funding.

The registry staff includes a coordinator, a supervisor and 3 registrars. The advisory committee includes an epidemiologist, a pathologist and an oncologist.

Data are actively collected from 25 sources: one specialised hospital, two university hospitals, one general hospital, 10 pathology labs, one hematology clinic, two oncology clinics, two radiation therapy clinics, and 6 chemotherapy clinics. Information on deaths is retrieved from the Mortality Information System (SIM).

Use of the data
In addition to determining cancer incidence and geographic distribution in the city of Cuiabá, the information has been used to study temporal trends, to provide access to screening programs, to collect data for epidemiological studies, to provide resources for teaching and delivery of lectures, and to support cancer prevention and care actions.

Source of population
2001 and 2002, estimates. 2000: census. Estimated by Brasilian Institute of Geopgraphy and Statistics (IBGE) Official Bureau (www.ibge.gov.br).

Multiple primary rules used
IACR rules (1990).

Brazil, Goiânia

Registration area
The Cancer Registry of Goiânia is a population-based cancer registry that covers an area of 739 Km^2. The city is a part of the central plateau in Brazil. The local altitude is 800 meters, at latitude 16º 40" and longitude 49º 15". The climate is tropical and the city is hot and sunny almost all year. The average annual temperature is 10–30Cº.The humidity averages 43% during the winter and 74% during the summer. Two rivers, João Leite and Meia Ponte, cross the city and provide its water. Goiânia, the second planned city in Brasil, is now 72 years old.

The majority of the population comes from rural areas. In the last ten years, the population migrating to the city is decreasing, because agricultural industries are increasing in the rural areas. The ethnic composition is primarily mulattos and whites, with a few blacks. The main religion is Catholic but the number of evangelicals is increasing.

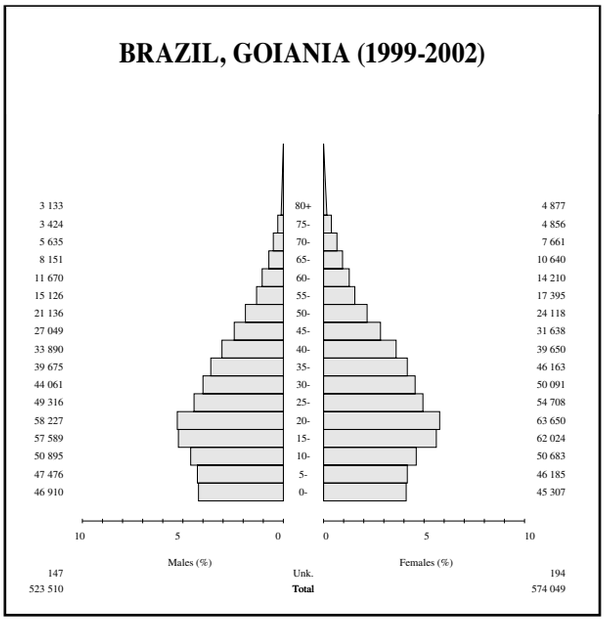
Cancer care facilities
We have one Cancer Hospital founded 50 years ago, which provides 180 beds, chemotherapy, 4 radiotherapy machines, surgery, and chemotherapy, as well as bone marrow transplantation since 2000. There are 5 private clinics also doing chemotherapy. The cancer centre also provides cancer training courses in surgery, radiotherapy and chemotherapy.

Registry structure and methods
The registry is located in the Cancer Hospital. Financial support comes from the Associação de Combate ao Cancer em Goiás (ACCG).

The registry is coordinated by an oncologist. Four people collect data and there is one to code. There is also an Advisory Council comprising seven specialists in oncology.

Data collection is active and no precoded data are received. The main sources of information are the Cancer Hospital, outpatient cancer clinics, histopathology laboratories and the University Hospital. The registry has access to death certificates, which include identifying information. Cancer is not a notifiable disease.

Quality control procedures include verification of date of birth versus topography, sex versus topography and morphology, etc. Analyses of incidence and mortality being evaluated include: cervix cancer, breast cancer, and prostate cancer. We also carry out studies on survival of cervix cancer, breast cancer, colon cancer, larynx, mouth, oesophagus and cutaneous melanoma.



Interpreting the results
There are screening programmes for detection of breast, skin and prostate cancer. PSA testing is not common.

Use of the data
Data on incidence are reported to the providers of information to the registry, and the registry collaborates with postgraduate students doing theses. Research is being carried out on cancer of the oral cavity, larynx and oesophagus in a collaborative study.

Source of population
Estimated by the Brasilian Institute of Geography and Statistics (IBGE) Official Bureau (www.ibge.gov.br).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

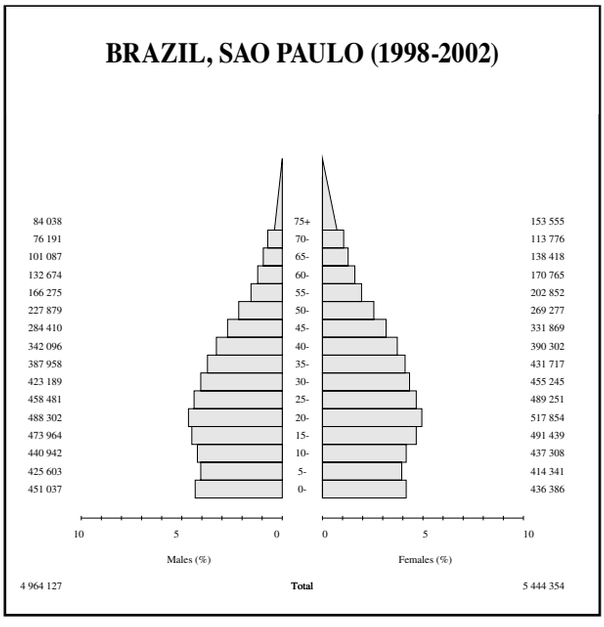
Brazil, São Paulo

Registration Area
The São Paulo Cancer Registry covers the resident population of the city of São Paulo, capital of the State of São Paulo, located in the Brazilian Southeast Administrative Region. The population data is based in the most recent Census (2000), and it includes more than 10 million people, mostly urban (almost 99%) and formed by migrants of many nationalities (Italians, Portuguese, Spanish, Japanese, Germans, etc.). A high percentage of the population is Catholic.

Cancer care facilities
General health care is provided by the local and state health services departments through the district health centres and hospitals, supplemented by private practitioners and covered by insurance. Regarding cancer, São Paulo has many hospitals, radiotherapy and chemotherapy services and pathology laboratories.

Registry structure and methods
The Registry belongs to the Department of Epidemiology of the School of Public Health of the University of São Paulo, one of the five preeminent Brazilian universities.

The financial support is provided at all three government levels (local, state and federal resources). A coordinator (a cancer surgeon physician), 8 data collectors, and three informatics processors compose the administrative framework. There is also a Scientific Commission that provides epidemiological, statistical and pathology assistance.



Although cancer is not considered a notifiable disease, the methods of data collection are mixed; some hospitals have active notifications (spontaneously) of newly diagnosed cases, and others have passive notifications. The main data sources (380 units) are hospitals (some are cancer hospitals) and pathology laboratories.

A special study of survival of cervix cancer and breast cancer in young women illustrated the very good completeness and accuracy of the information recorded in the registry.

Interpreting the results
There are breast and cervix cancer screening programmes in the area covered, and PSA testing is also common.

Use of the data
Annual reports on cancer incidence and mortality are prepared highlighting trends and changes. Some special survival studies (cancer in childhood and cervix cancer) have been carried out.

Many graduate students use the registry data bank for their PhD theses or Masters Degree dissertations; the local health authorities use it as well.

Source of population
Census 2000. 1998, 1999, 2001, 2002 estimated by Foundation Seade (Official Institucion For Population Statistics In The State Of Sao Paulo).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

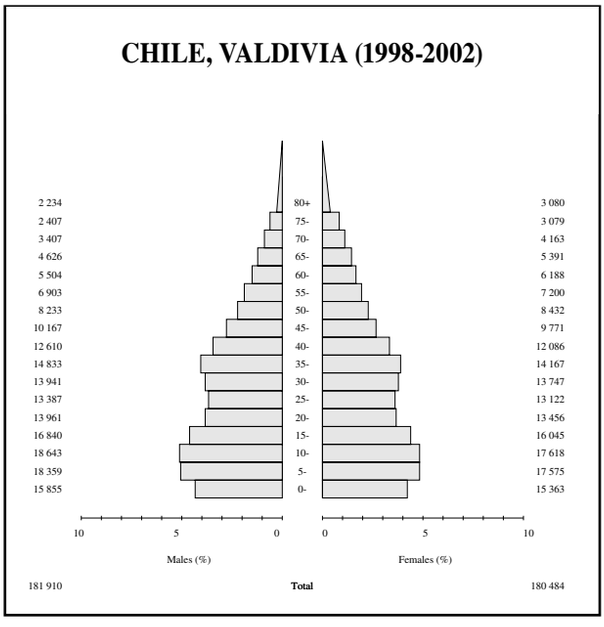
Chile, Valdivia

Registration area
Valdivia's registry area corresponds to Valdivia province, which is divided into 12 districts, located in the 10th region in the south of Chile. The total population of the province, based on the last 2002 census, is 356 396 inhabitants, with a male:female ratio of 1:1; the rural population reaches 38%. Some 70% of the population is in the public health system.

According to the 2002 national census, among the population over 15 years old in Valdivia province 62.5% are Catholic, with 24.5% evangelicals, 7.8% atheists and 5.2% other religions. Ethnic groups comprise 11.4%; the indigenous Mapuche represent 99.1% of these.

Cancer care facilities
The health care network of Valdivia province is mainly public. It comprises 16 primary care centers and 8 public general hospitals, which refer their patients with presumed oncological diseases to Valdivia Regional Clinical Hospital. This is the only oncology centre of the registry area, and it also provides teaching and health services in coalition with the Universidad Austral de Chile.

This core hospital has a pathology laboratory and provides surgical, radiotherapy and chemotherapy treatments. The child radiotherapy treatment facility is the only one in our region.



Registry structure and methods
The population cancer registry is in the Epidemiology Unit Office of Valdivia Province, which is part of the Regional Health Authority of the 10th region, a dependent unit of the Undersecretary of Public Health of the Health Ministry.

It receives technical support from the oncology committee of Valdivia Regional Clinical Hospital and it has one nutrition professional with 33-hour week and two physicians part-time, all with master's degrees in public health.

The registry uses six information sources, passively receiving weekly notifications from the pathology laboratory of the Valdivia Regional Clinical Hospital and actively reviewing all of the clinical records of previous week's patients discharged with cancer diagnosis, both from the Regional Hospital of Valdivia and from the private centres. Also, all cases that enter through particular units and programs are reviewed: Hematology, National Program for Cancer Medication (drugs) and Pain Control Program. The registry also has access to review all of the province's death certificates and the data kept by the Statistical Departments of the Chilean Health Ministry.

We use the CanReg program to register the basic variables defined for the population cancer registries of Chile. The quality standards used are: Percentage of cases with microscopic confirmation; Percentage of cases with death certificate only; Percentage of cases registered without age; and Ratio mortality/ Incidence. Cases are maintained confidentially, preserving the patients' individual information.

Interpreting the results
It is not possible to estimate the proportion of cases of Valdivia residents who choose to continue study or seek treatment in another province, but it is considered to be low as Valdivia Regional Clinical Hospital is the referral centre for the southern area of the country.

Data are evaluated by checking different data sources and their validity, as well as the coding system and correct computational support and quality standards. We apply the IARC Check program once a year in order to find and correct any errors.

There are national programs of early detection for cancer of the cervix (Pap smear) and breast (physical exam and breast x-ray in high risk group). There is no national program of PSA testing; it is usually requested in patients with benign prostate hyperplasia, and sometimes requested in preventive medicine.

No environmental changes that would affect cancer incidence have been registered during the study period, but in 2004 a cellulose factory began operating.

Use of the data
The registry has prepared incidence reports for publication in the epidemiology bulletin *El Vigia* from the Health Ministry, and which are available on the Ministry's web site. Last year we completed specific survival studies in gastric and gall bladder cancer; these were provided to the groups in charge of the protocols for both diseases in the Health Ministry.

Registry information was also used in planning modernisation and enlargement projects for the oncology service at Valdivia Regional Hospital.

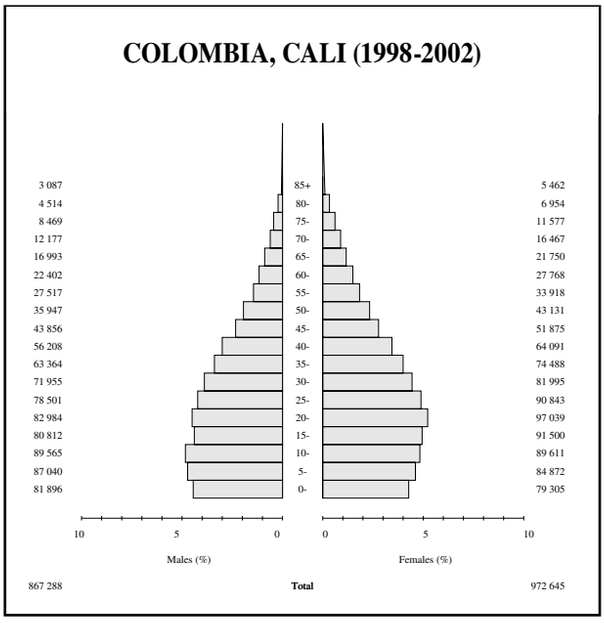
Source of population
The National Statistics Institute makes a national population census every 10 years. the last of which was in 2002. This provides a projection of the population for each region, province and commune.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Colombia, Cali

Registration area

The Registry, in operation since 1962, is limited to the urban area of the city of Cali. Cali is the capital of the Department of Valle, one of Colombia's 32 departments. The department is located in the south-west of Colombia on the Pacific Ocean. Cali is situated 1000m above sea level between the Cauca river to the east and the chain of the Andes to the west, at latitude 3°27' N and longitude 7°31' W. The average temperature is 24°C. The urban registration area of the registry is 120.9 km². The population at the most recent census (2005) was 2 030 000. The great majority of the population are Mestizos (a mixture of Spanish and Indian) with a minority of blacks and whites. More than half of the population are migrants from other areas of Colombia, and in lesser part from other countries. The major part of the population is Catholic. The official language is Spanish.



Cancer care facilities

The Colombian Social Security System reformed in 1993, creating two healthcare systems, one for those who can afford to pay for health care and one for those who cannot. Because the subsidised healthcare system does not have the capacity to meet demand, a third system has developed for those who are "linked" to the subsidised health care system but are not part of it. Those who are "linked" receive a document attesting to their status, and they can receive emergency care. Health services management and delivery are decentralised to strengthen the role of departments and municipalities, the private sector is incorporated within the insurance and health services delivery functions, and basic health services are free and compulsory.

A basic network of health centres has been planned for the entire urban territory, and programmes of primary care and prevention have been promoted. About 60% of the cancer patients diagnosed in Cali are treated at Valle University Hospital, a public general hospital with a total of 630 beds. A hospital-based cancer registry was established in 1986, a team for the management of childhood cancer began activities in 1989, and a formal oncology department was initiated at the end of the 1990s. The hospital also maintains radio- and chemotherapy facilities. Other facilities for cancer diagnosis and treatment include four major non-university hospitals, cytopathology and haematology laboratories, and radiotherapy and chemotherapy centres.

Registry structure and methods

The registry is located in the Department of Pathology of the Medical School in the Universidad del Valle. The staff includes a Director, who is the Professor of Pathology, three assessing pathologists, a statistician coordinator, three record clerks and a secretary. Once a year, a group of specially trained medical students is selected to carry out a field survey of files of all private physicians who diagnose or treat cancer patients. The registry staff and part of the operating cost are covered by de Universidad del Valle. Most of the operating costs are obtained from foundations and specific grants for each activity.

The CCR registry uses active case finding from 57 sources of data, including cancer hospitals, general hospitals, teaching hospitals and 32 pathology laboratories. The information from death certificates is obtained from the Municipal Office of Vital Statistics to check against cancer registration. The death registration system is very adequate and complete, and the cause of death is always noted. The registry staff visit these sources, where they scrutinise the records kept in medical records departments, and registers of individual departments concerned with diagnosis and treatment of cancers, to identify and abstract information on cases of cancer, diagnosed by all methods, among residents of the registry region. The data concerning each case are registered on a special form at the source site. They are classified and revised at the registry office, and the information is entered into a computer database for checking for duplicates, errors and inconsistencies. Difficult cases are discussed by the staff and resolved either by the registry director or by revisiting the source and sometimes reviewing the microscopic slides. No active follow-up is carried out.

Use of the data

The population-based cancer registry of Cali has been studying incidence and mortality trends in the city for the period 1962–2001 using the age-period-cohort model. A long-term analysis of survival of uterine cervix cancer is underway.

A brochure that contains information on CCR activities and incidence and trends in Cali was issued by CCR and distributed to physicians and Health Services. The Cali Cancer Registry is pleased to provide cancer statistics through this Web page: http://rpcc.univalle.edu.co.

Source of population

Intercensal estimates of the resident population by age and sex for each year 1997, 1998, 1999, 2000, 2001 and 2002. The intercensal estimates were obtained by exponential interpolation from the census counts of 1993 and 2005.

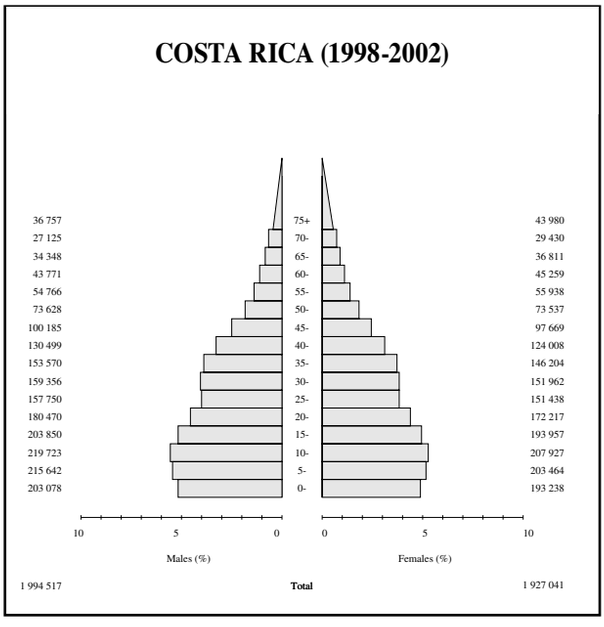
Multiple primary rules used

IACR rules (2000)

Costa Rica

Registration area
Costa Rica covers an area of 51 100 km^2. At the 2000 census the population was 3 810 179 (1 902 614 males and 1 907 565 females), of whom 59% lived in cities and 41% in rural areas. The official religion is Roman Catholic. The main ethnic group is Caucasian-Native, and there are smaller proportions of Blacks, Natives, Chinese and Caucasian-Black.

Cancer care facilities
The country has a national health care system and good-quality vital statistics. The National Social Security system covers more than 90% of the population. The remaining 10% are attended by private health services. Social Security is organized in 3 levels: patients with suspected cancer are referred to the 2nd and 3rd levels (specialised). The Social Security system is made up of 29 hospitals; 5 of them have an Oncology Department. Only 2 hospitals have radiotherapy departments, and there are 2 private radiotherapy centres.



Registry structure and methods
The Costa Rica National Tumour Registry was founded in December 1976 by Executive Decree and started functioning in 1977, but nationwide coverage was achieved only in 1980. The aims were to collect data about cancer incidence and prevalence regarding age, sex, cancer site and geographical distribution within the country.

The registry occupies a section of the Statistics Department of the Ministry of Health, which provides all financial support. One physician, a medical registry technician and two statistical assistants are dedicated full time to the registry. Several medical registry technicians of the Statistics Department collaborate with the registry obtaining information on incomplete cases at the hospitals and clinics and during the death clearance process.

The sources of information for the registry are the compulsory notification sheets on patients leaving hospital, biopsy and autopsy reports with a diagnosis of cancer from all pathology services (public and private), and death certificates mentioning cancer from the National Institute of Statistics and Census.

Except for death certificates, which must be retrieved by the staff, data collection and case follow-up are passive. Death registration is complete, as it is compulsory to show a death certificate before burial. All death certificates mentioning cancer undergo a clearance process within the hospitals of the healthcare system, after which they are classified as DCN or DCO cases or are discarded.

The registry is fully computerised, and each report sheet is checked against the Civil Registry database to determine if the report concerns a Costa Rican. For nationals the personal identification number, name and date of birth or death are verified. Foreigners are included and coded as such in the ID variable; there is a special code for cases of uncertain origin. Reports are then linked to the registry database, using software specially designed to find duplicates, to classify the case as incident or not. Each primary tumour case is given a unique identifying registry number, which is included in the registry database. Several consistency check edits are carried out during data entry, including date of birth/incidence date/ date of death, sex/site, age/ site, age/histology, and site/ histology. Multiple primaries are registered according to the IARC rules.

Follow-up of cases is mostly passive, although every four years an update of death dates is conducted with the Civil Registry.

Interpreting the results
Although no study has been made to evaluate the registry's completeness of coverage, under-registration is estimated to be low given the characteristics of the health system and the vital statistics.

Cases with a cytological diagnosis are accepted when localized in specific sites such as lung and cervix.

The country has made important efforts to establish early cancer detection programmes, especially for cervix, breast, stomach, colon, prostate and skin cancers.

Use of the data
The registry information is used in cancer control decision-making at several levels, and also has been used in various studies regarding occupational exposure cohorts and the risk of cancer during recent years, as well as in descriptive and survival studies.

The country will soon reinforce the Cancer National Health Care Network as part of the recently-defined National Cancer Plan. As cancer is the second cause of mortality in the country, it is considered a principal public health problem.

Source of population
The estimated annual populations were based on the censuses of 1984 and 2000.

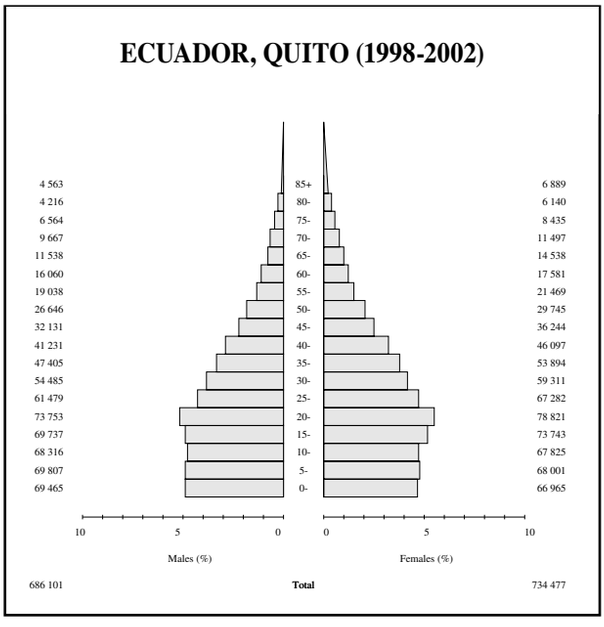
Multiple primary rules used
IACR rules (2000) on CI5 IX period

Ecuador, Quito

Registration area
The National Cancer Registry covers the population living in the city of Quito, the capital of the Republic of Ecuador, situated at 2810m above sea level, in the Andes Cordillera. The city is surrounded by mountains and the average temperature is 17°C.

The average annual growth rate of the population is 2%, which includes a large number of immigrants from rural areas and migrants to migrants to other countries. Most of the population are mestizos (mixed race), and the main religion is Catholic. The literacy rate is 97% of the population; 39% have received primary school education and 23% higher studies.

Cancer care facilities
The healthcare facilities in the city comprise nine general hospitals, relying on the Social Security system and the Ministry of Health, two private hospitals and 30 private clinics. The largest hospital belongs to the Social Security system and has 700 beds used by affiliated workers. The private clinics have between 20 and 80 beds. There is a new modern oncological hospital with 160 beds, which belongs to the Fight Against Cancer Association (Lucha contra el Cáncer, or SOLCA). A full range of diagnostic facilities and treatment by surgery, chemotherapy and radiotherapy are available. According to registry data 34% of patients are diagnosed in the private sector.



Registry structure and methods
The National Cancer Registry of Ecuador was created in 1984, with the initial collaboration of PAHO/WHO, by a ministerial degree in which SOLCA was declared responsible for the funding and administration of the registry. The registry has a Steering Committee directed by the President of the Association.

The personnel of the registry comprises a Director, two epidemiologists and four full-time registrars including on responsible for the computer system. The Director is a medical pathologist and establishes the registry procedures, coordinates the general activities of the registry and is responsible for inter-institute relationships. The epidemiologists coordinate personnel activities, control data quality and set up and facilitate studies, particularly between physicians in SOLCA.

Data collection is active, and the main data sources are pathology and haematology records, from both the public and the private sectors, and clinical records of public and private hospitals. Registrars also contact many physicians who treat cancer patients in the private sector.

The 53 pathologists in the city collaborate voluntarily and enthusiastically in the work of the registry, allowing the registrars to consult their records and in many cases filling out a part of the notification form themselves.

Other sources of information are the death certificates and hospital discharge lists collected by the Institute of Statistics and Census of Ecuador (Instituto de Estadísticas y Censos del Ecuador, or INEC). Follow-up is passive and consists of matching death certificates with the cases registered.

The registry has promoted the creation of cancer registries in other cities in the country, and is monitoring their activities; there are now registries in the cities of Guayaquil, Cuenca, Portoviejo, Loja, and Machala, and a gastric cancer registry in the province of Tungurahua.

Interpreting the results
The National Cancer Registry publishes data in an annual report that is distributed within the country and abroad. The 1999–2002 report shows a significant improvement in the quality of the data. Data on 73 651 cases, 48% of whom were residents of Quito, were received in the registry between 1985-2003.

In the last three years a screening programme for cervical cancer has been undertaken with great enthusiasm. It is supported by WHO, and the registry provides the baseline data to monitor results.

Use of the data
The registry has carried out a number of studies on the epidemiology of selected cancer sites and on quality control, and results have been published locally or internationally. The majority of the scientific research on cancer carried out in the city and in much of the country uses the data from the registry.

Source of population
2001 Census, corrected for non–response rate and for migration. Instituto Nacional de Estadística y Censos INEC. Proyecciones de Población por provincias, cantons, áreas, sexo y grupos de edad. Serie 01 Nro 206. Quito. Agosto 2004.

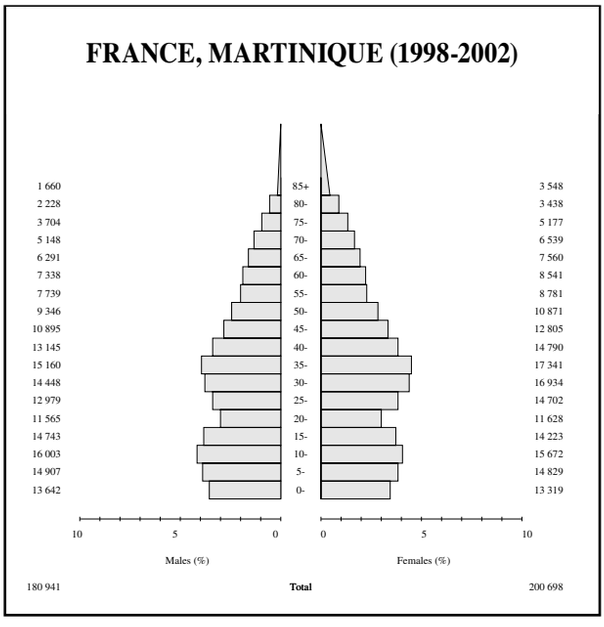
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

France, Martinique

Registration area
Martinique, a French overseas department, is a 1100 km^2 island located between the Caribbean sea and the Atlantic ocean. The department is divided into 34 administrative areas called communes (municipalities).

In the 1999 census, 381 500 inhabitants were living on the island; 57% of people aged >65 years were women. The ethnic distribution was: African or African/white/Indian mixture 90%, white 5%, and East Indian, Lebanese, and Chinese less than 5% each. Immigrants made up about 1% of Martinique inhabitants.

Cancer care facilities
The population is served by 9 public hospitals, including the University Hospital of Fort-de-France. The medical infrastructure in Martinique is almost entirely located in Fort de France: the University Hospital, which comprises the radiotherapy-oncology service, the nuclear medicine service, the haematological and pathological laboratories, the clinical haematology service and department of medical information, two private clinics and one laboratory. Eight other municipal hospitals contribute to diagnosis and treatment of cancer. Medical care is free of charge, allowing unrestricted access to high-quality medical services for all cancer patients registered in regional health insurance files.



Registry structure and methods
Cancer registration has been mandatory in Martinique since 1981, with the Association Martiniquaise pour la Recherche Epidemiologique en Cancérologie (AMREC) being officially created in 1986. The Registry has been integrated into the CHU de Fort de France since 2003. In France, the Registry is integrated into the National Cancer Registry Association (France Cancer Incidence Monitoring, or FRANCIM).

Cancer cases are identified using common sources of information: medical evacuation files, data from private and public hospitals, laboratory files, regional insurance records of the national public medical insurance system. Cases are also declared spontaneously by doctors or by active collection. Letters are sent regularly to all private and public cancer treatment structures. Cancer diagnoses are verified using private and public laboratories of pathology. Cancer cases are only kept for people living in Martinique at the time of diagnosis. The registry is staffed by a full-time medical officer, a full-time registrar and one full-time health worker.

Interpreting the results
In the last decade cancer has become a high public health concern in Martinique. It is the second leading cause of death in men and in women. Several tumours—prostate, breast, colon and rectum, non-Hodgkin's lymphoma—are increasing in the general population. The way of life in Martinique has been changing considerably over the past 20 years. The socio-economic status is now among the highest the Caribbean area, and Martinique's way of life tends to be "westernised" because of constant exchange with metropolitan France. Other characteristics include a highly mixed population, low tobacco consumption and, in most areas, replacement of traditional diet by imported food. Changes in a common set of exposures (lifestyle modification, life expectancy) and improved diagnostic procedures, earlier detection (use of the PSA test, mammography, the Hemoccult test and an organised cervical cancer screening programme in Martinique since 1991) have been suggested to explain these trends.

Use of the data
The registry provides a five-year report of cancer incidence, highlighting trends and changes. Data are also use for evaluation of cancer screening, medical practices and environmental risk assessment. Survival studies for prostate and colorectal cancer patients have also been carried out.

Multiple primary rules used
IACR rules (2004) on historical data.

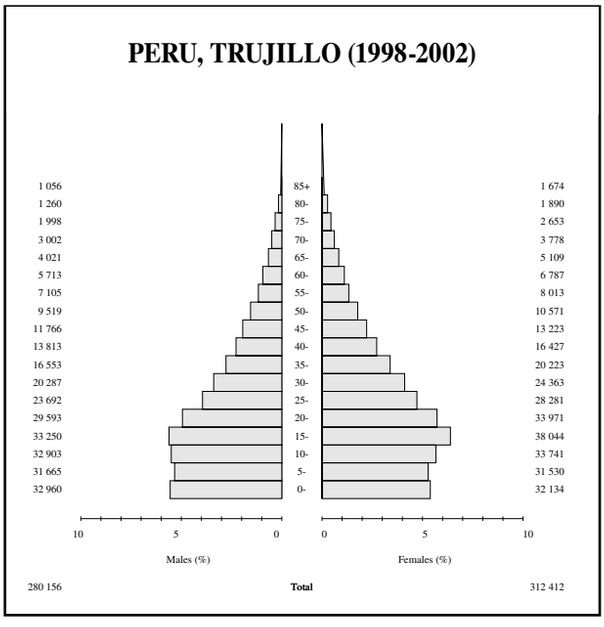
Peru, Trujillo

Registration area
The Trujillo Cancer Registry covers the population of five districts (Trujillo, La Esperanza, El Porvenir, Florencia de Mora and Víctor Larco). They represent Metropolitan Trujillo, on the north coast of Perú. The population at the most recent census (1993) was 513 223. About 96% of the population live in urban areas; 90% are Roman Catholics

Cancer care facilities
Diagnostic and treatment facilities are provided by the Ministry of Health (MINSA) and the Social Security (EsSALUD) hospitals, supplemented by private clinics. Radiotherapy is supplied by one telecobalt unit and radium devices at Belén Hospital.

Registry structure and methods
Financial and technical assistance are received from IARC under a Collaborative Agreement with the National University of Trujillo. The Central Office of the Registry is at Belen Hospital. The Registry is staffed by a pathologist (head of the Registry), one statistician pathologist, one computer analyst and one part-time statistical technician.

Data are collected actively from three general hospitals, the radiotherapy service, and private clinics, pathology laboratories and oncologists. Mortality data are obtained from the original death certificates furnished by the Regional Health Authority. The Registry staff scrutinise the death certificates to complete the database records or to follow up. The Registry members visit the sources to screen the hospital discharge notes and scrutinise the cancer medical records to abstract the required information onto special forms. Data from patients referred to the National Cancer Hospital (Instituto Nacional de Enfermedades Neoplásicas) in Lima are also recorded.



A formal evaluation of the completeness or accuracy has not been accomplished for the 1998–2002 period, but quality data are available.

Interpreting the results
The high incidence of cervical cancer is probably results from the cervical screening programmes implemented by MINSA, EsSALUD and the Trujillo Cancer Prevention League. Breast cancer detection is limited, and PSA screening has not been established.

Transformative industries (agro-industrial, leather, metalmechanic) are located in the suburban areas of the region. Trujillo has a high proportion of motor vehicles, but results of official CO testing are within acceptable limits. The relatively high cost of cigarettes probably explains the low lung cancer incidence.

Use of the data
Every five years a cancer incidence and mortality report is published and delivered to the health authorities, universities and medical institutions. The Registry has also carried out cervical cancer survival and childhood cancer research. Registry data have also been used for university theses and in planning for the Northern Cancer Hospital.

Source of population
The population data were estimated by linear interpolation on the basis of the 1981 National Census and the 1993 National Census. The projection was made by age group for each sex.

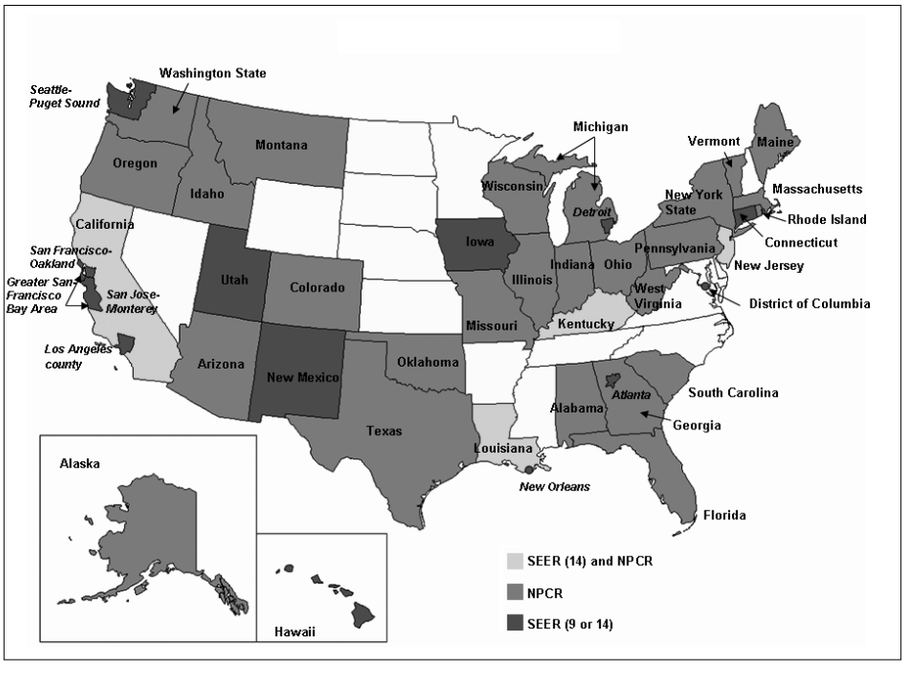
Multiple primary rules used
IACR rules (2000).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

North America

Canada

United States of America



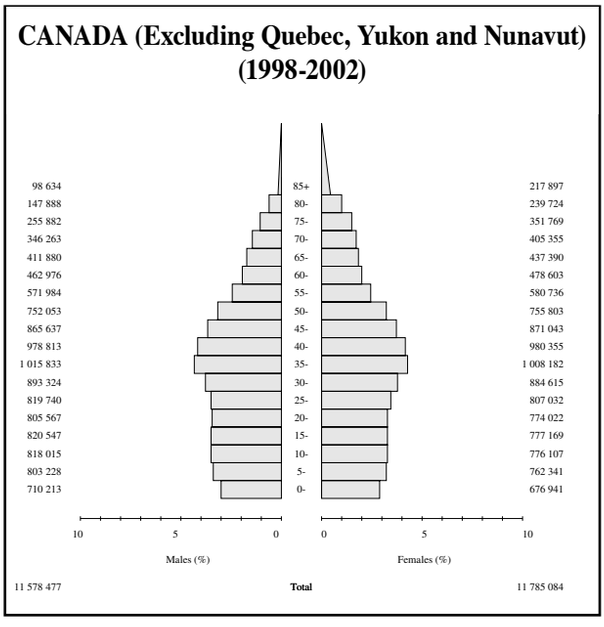
Canada (Excluding Quebec, Yukon and Nunavut)

Since 1969, Statistics Canada, Canada's central statistical agency, has collected population-based cancer incidence data. Starting with the 1992 data year, these data have been compiled by the Canadian Cancer Registry (CCR), replacing the event-oriented National Cancer Incidence Reporting System that existed from 1969 to 1991. The CCR provides national incidence and survival information required for cancer control. Reporting of cancer data by the ten Canadian provinces and two territories is coordinated by the Canadian Council of Cancer Registries, which includes representatives from each of the provincial and territorial cancer registries, Statistics Canada, and the Public Health Agency of Canada.

Registration area

Canada is the second-largest country in the world, with an area of 9 984 670 km^2 extending from longitude 53º to 141º W and from latitude 42º to 83º N. It is bounded to the west by the Pacific Ocean and Alaska, to the north by the Arctic Ocean, to the east by the Atlantic Ocean and to the south by the United States.

In 2001, the population of Canada numbered 31 110 565, of whom 25.5% were under 20 years of age and 12.6% aged 65 or over. Most Canadians live in a corridor about 300 km wide along the southern border. Almost one third of the population is concentrated in the metropolitan areas of Toronto, Montreal and Vancouver.



Between 1991 and 2001, Canada attracted 1 830 680 new immigrants (almost 6% of its population). Ontario attracted 55.8% of the new arrivals, followed by British Columbia (20.2%), Quebec (13.4%) and Alberta (7.1%). Almost one fifth of all Canadians are foreign-born.

Canada is an ethnocultural society. In 2001, visible minorities constituted 13.4% of the population. Of these, the largest three groups are: Chinese (25.8%), South Asian (23.0%), Black (16.6%), and Filipino (7.7%). English is the mother tongue of 58.5% of the population and French is the mother tongue of 22.6% of the population. The major religious denominations are: Catholic (42.9%), United Church (9.6%), and Anglican (6.8%). The aboriginal population of Canada (accounting for 3.4% of the population) is primarily comprised of North American Indians, Métis, and Inuits.

Registry structure and methods

The patient-oriented Canadian Cancer Registry evolved from the event-oriented National Cancer Incidence Reporting System[1] established in 1969. The Canadian Cancer Registry is an administrative survey. Beginning with cases diagnosed in 1992, cancer incidence figures collected by provincial and territorial cancer registries have been reported to the Canadian Cancer Registry, which is maintained by Statistics Canada. The Canadian Cancer Registry has been developed to provide Canadian incidence and survival information required for cancer control. The Canadian Cancer Registry forms a personal information bank that is listed in the annual publication *Info Source: Sources of Federal Government Information*.

The Canadian Cancer Registry is a collaborative effort between the thirteen Canadian provincial and territorial cancer registries and the Health Statistics Division of Statistics Canada.

The Canadian Cancer Registry is a dynamic database of all Canadian residents alive or dead who have been diagnosed with cancer. The function of the Canadian Cancer Registry is to produce standardised and comparable cancer incidence data for each newly diagnosed primary site of cancer. The Canadian Cancer Registry system records the kind and number (incidence) of primary cancers diagnosed for each person over a number of years until death. The advantage of this system is that longitudinal data are available for each cancer patient. New primary cancers occurring for previous cancer patients are identified. The patient data are linked annually to the Canadian Mortality Database so that the date, place and cause of death of every cancer patient are eventually known.

In addition to information on cancer incidence, data are available about the characteristics of patients as well as about the nature and frequency of their tumour(s). Since patients' records remain active on the Canadian Cancer Registry until confirmation of their death, survival rates for the various forms of cancer can be calculated.

The Canadian Cancer Registry also employs specialised internal record linkage software for detecting duplicate records and for clearing death records. These procedures are done annually. Conflicting information and other problems with the cancer data are resolved through consultation with the reporting provinces and territories.

Use of the data

The annual publication *Canadian Cancer Statistics* is produced by the Canadian Cancer Society, the National Cancer Institute of Canada, the Public Health Agency of Canada, Statistics Canada, the Provincial/Territorial Cancer Registries and Health Canada. The estimates are calculated through extrapolation of cancer incidence data from the National Cancer Incidence Reporting System (NCIRS, 1969–1991) and the Canadian Cancer Registry. Also, non-nominal data for all Canadian registries are published annually by NAACCR in *Cancer Incidence in North America*.

Source of population

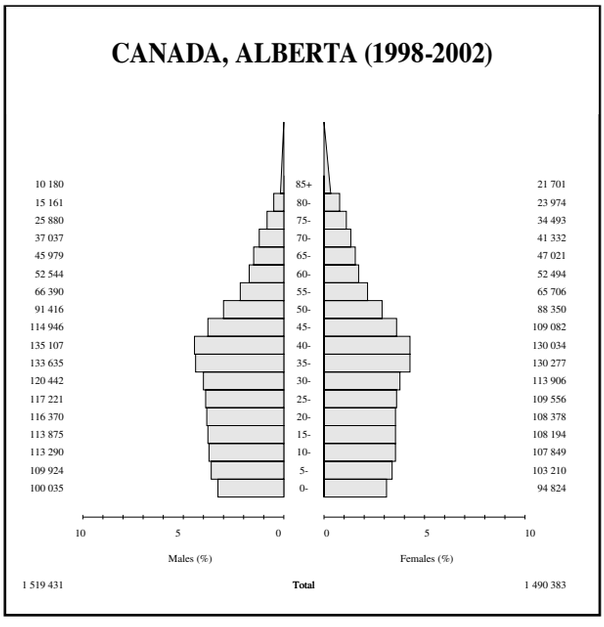
Estimates of Population by Age and Sex for Canada, the Provinces and the Territories (1998–2003).

Canada, Alberta

Registration area
Alberta is one of the Prairie Provinces of Canada. Its area of 661 688 km^2 lies between latitudes 49° and 60° W. The Alberta Cancer Registry covers the population of the 9 Regional Health Authorities within the province of Alberta. The population estimated for Alberta in 1999 consisted of 1 466 696 females and 1 497 933 males.

Alberta has a multi-ethnic population; half of the population are of British extraction, the remainder including people of other European, Asian and Native American origins.

Cancer care facilities
Cancer care is provided and administered by the Alberta Cancer Board in two major treatment centres, four associate and eleven community cancer treatment centres throughout the province. The two major tertiary centres, the Cross Cancer Institute, in Edmonton and the Tom Baker Cancer Centre, in Calgary provide radiotherapy, systemic therapy, and limited surgical procedures. The associate and community cancer centres provide chemotherapy services.



Registry structure and methods
The Alberta Cancer Board's Division of Population Health and Information operates a number of cancer prevention, screening and surveillance initiatives on behalf of the organisation. Several organisation-wide services are also coordinated by this Division, which maintains the Alberta Cancer Registry under the directorship of Dr. Heather Bryant. The Alberta Cancer Registry operates out of the two tertiary cancer centres. Calgary is responsible for the southern half of the province while Edmonton maintains data for the northern half. The Registry staff is involved in coding and abstracting, entering data into the collaborative stage program, research projects, and quality assurance activities. Completeness of cancer cases is very high in the Registry; however, passive follow-up to find additional cases includes record linkage with Alberta Vital Statistics and an ongoing case ascertainment project with the Alberta Health Registration file.

Provincial legislation mandates the registration of all reportable cancers from diagnostic facilities and medical practitioners within Alberta. The Alberta Cancer Registry primarily uses a passive case-finding approach. Pathology, cytology, and operative cytology reports as well as reports from scans, x-rays, etc. with the mention of cancer are sent to the registry. The province is in the process of implementing a provincial electronic health record, which will improve the accuracy of patient demographic information as well as provide timelier access to the reports previously outlined. In addition, Alberta Vital Statistics provides an electronic file each month of all individuals dying in the province, which enables the Registry to identify patients who have died from cancer or cancer patients dying from other causes.

The Alberta Cancer Registry maintains routine computerised and manual quality assurance data reviews of specific variables on a monthly, quarterly, and yearly basis as required. Mechanisms have also been established to measure the quality of registry-collected variables with respect to completeness, accuracy, and timeliness. The Alberta Cancer Registry received the Gold Standard awarded by the North American Association of Central Cancer Registries (NAACCR) for 1998, 1999, 2000, 2002, 2003, and 2004 incidence data. For 2001 data, silver certification was awarded.

Use of the data
The Alberta Cancer Registry publishes or is involved in the development of several documents on cancer incidence and mortality in Alberta. Publications include the annual report, *A Regional Picture of Cancer in Alberta* (for the Regional Health Authorities), *A Snapshot of Cancer in Alberta*, and various monographs.

The registry is the key source of information for service provision planning by the Alberta Cancer Board, its host agency. Information on cancer within each regional health authority in Alberta is also released to them for planning services. The registry provides data to the screening programs to allow for quality assurance and follow-up of mammography and cervical screening.

The Cancer Registry also has a close relationship with the Alberta Cancer Board's clinical database, which enhances data analysis opportunities.

We also respond to over 100 requests for information from the Registry each year. Many of these requests involve the use of Registry data for population or clinical research questions. Examples of this include the use of registry data to invite participants into intervention trials, or studies of the use of complementary therapies for cancer treatment. All research projects must be approved by the Research Ethics Board prior to initiation, and the registry, rather than the investigator, is the usual originator of contact with the individual. Registry data has also been included in several multi-centre studies, and the Alberta Cancer Registry has combined registry data with other research data to examine the projected impact of the use of Hormone Replacement Therapy in the population.

Source of population
The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used
IACR rules (2004) on historical data

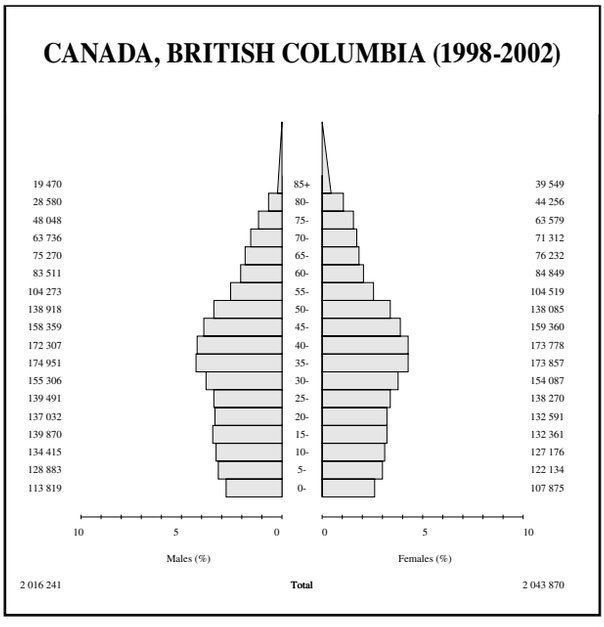
Canada, British Columbia

Registration area

The registry covers all of British Columbia (BC) (926 492 km^2), the most westerly province of Canada, bordered by Alberta to the east and by the Pacific Ocean to the west. Most of the population is concentrated in the southwest corner of the province, where the climate is the mildest.

The proportion of immigrants in the population has increased by 1.3% from 17.7% for the 1991–1995 period to 19.0% for 1996–2001. Currently, most immigrants to BC come from Asia, in particular China, Taiwan, India, Hong Kong, the Philippines and South Korea. Based on the 2001 census, 56% of British Columbians belong to a single ethnic origin and 44% to more than one. The largest group of visible minorities within British Columbia is the Chinese, followed by South Asians. Aboriginal people comprised 4.4% of the population in 2001.

The top three industries within British Columbia are retail trade, health care and manufacturing, with the largest component of the working population employed in clerical and sales occupations.



Cancer care facilities

Cancer diagnostic services are provided through general hospitals and specialty clinics. Cancer therapy is provided through a mix of dedicated cancer facilities and general hospitals. The BC Cancer Agency (BCCA), a provincial government agency responsible for cancer care, control and research in British Columbia, operates four regional cancer centres that have close links with local hospitals. Radiation therapy is provided exclusively through the four regional cancer centres. The regional cancer centres also provide approximately 50% of cancer chemotherapy services, with the remainder provided through the Communities Oncology Network, a collaborative voluntary partnership with 19 Community Cancer Centres, 6 Community Cancer Services and 12 Consultative Clinics across BC, in conjunction with the Regional Cancer Centres and the Systemic and Radiation Programs. The Network also supports appropriate delivery of cancer patient care and support in 33 other Community Hospitals.

Registry structure and methods

The registry is part of a combined population-based registry and clinical database maintained by the BCCA. The registry has monitored the impact of cancer on the BC population since 1969. For many years it was mandatory to report cancer cases; however, legislation passed in 1987 authorised the registry to obtain relevant information without the provision of mandatory reporting.

The registry received notification of 95% or more of the cancer cases diagnosed in the province by submission of pathology reports from hospital laboratories or following attendance at one of the four BCCA Cancer Centres, where about 61% of cancer cases are treated or seen at some point. The registry receives listings of all deaths in the province from the BC Vital Statistics Agency. Follow-up is performed to obtain complete registration information and documentation on all cases.

The personnel consists of a director and a scientific director, one senior, one supervisor and eight health record technicians.

Interpreting the results

The Screening Mammography Program of BC (SMPBC) was established in 1988 through the BC Cancer Agency to reduce breast cancer mortality through early detection. From 2000–2004 (inclusive), 1 134 806 examinations were performed for 512 372 women, and 4627 breast cancers were diagnosed (overall cancer detection rate of 4.1 per 1,000).

The BCCA's Cervical Cancer Screening Program was the first organised programme in the world to screen for cervical cancer. In BC, approximately 71% of women age 20 to 69 were screened in a recent 30-month period. The cervical screening programme is credited with an 85% reduction in the number of BC women getting cancer of the cervix and for reducing cervical cancer deaths by 75% since the 1950s.

The Hereditary Cancer Program (HCP) is a result of the BCCA and the BC Provincial Medical Genetics Program working together to provide information and genetic counselling for individuals and families with a strong history of cancer.

PSA screening for prostate cancer became common in the early 1990s although it is not a publicly funded service. Rates of prostate cancer peaked in 1993 and have declined since then.

Use of the data

The registry was originally set up to monitor cancer incidence and mortality in the province, but is now extensively used for health services planning and epidemiological research. Registry data are used as a source of cases for surveys and case-control studies, and as outcome data for cohort studies of occupational groups. Registry statistics and estimates of future incidence trends have also been used in conjunction with clinic referral data for cancer services, budgeting and facilities planning.

Source of population

The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

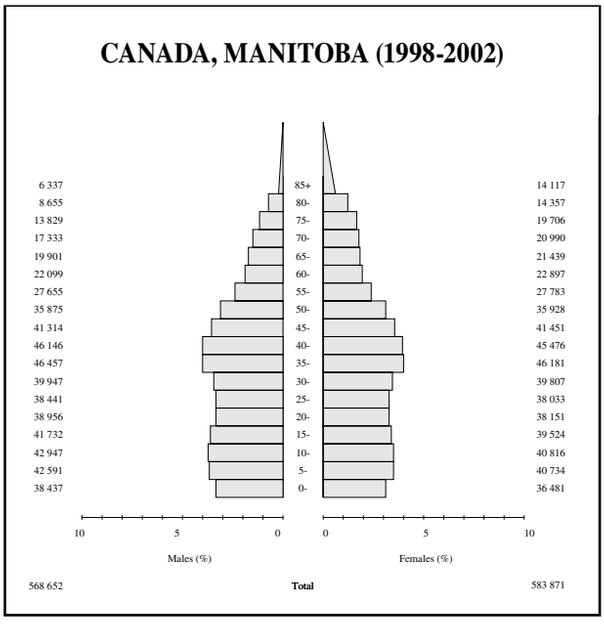
Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Canada, Manitoba

Registration area
Manitoba is a province located in central Canada, bordered to the east by Ontario and Hudson Bay, to the west by Saskatchewan, to the north by Nunavut and the Northwest Territories and to the south by the American states of North Dakota and Minnesota. It lies between latitude 49° and 60° N and longitude 90° and 102° W. The altitude varies from sea level to 823m, and the province covers an area of 649 950 km².

At the time of the 2001 census, 72% of the population was urban, with 60% living in the capital city of Winnipeg. Manitoba is ethnically diverse. Approximately 13.6% of all residents were Aboriginal (Native Americans 60.2%; Métis 37.9%; Inuits 2.3%). A similar number had immigrated from other countries. Of the 133 660 immigrants, 47.5% where born in Europe and 30.3% were born in Asia. The majority of Manitobans reported British (36.7%), French (12.6%) and/or other European (48.0%) heritage.



Cancer care facilities
CancerCare Manitoba is a provincial cancer agency with a mandate to coordinate all aspects of cancer control in Manitoba. Direct patient care involves the provision of treatment services, including outpatient-based radiation therapy at one centre in the major urban centre (Winnipeg), chemotherapy and breast screening mammography. The cancer agency partners with other community care facilities to provide cancer services through the Community Cancer Programs Network, an innovative program for delivering cancer care—primarily chemotherapy—in local communities throughout the province. *Supportive activities* include cancer-related consultation services for other healthcare providers and the development of standards for the delivery of cancer care in Manitoba, as well as the facilitation of cancer-related education, surveillance and research activities.

Registry structure and methods
Manitoba has one of the longest standing cancer registries in the world. It was started in 1937, although it did not become fully population-based until 1956. The registry is located within the Department of Epidemiology and Cancer Registry at CancerCare Manitoba. It is funded via CancerCare Manitoba by Manitoba Health, the provincial health department. The registry staff include the manager, eight cancer registrars, a quality assurance technician, a senior cancer registrar, three clerks and an administrative assistant. Three of the staff are Certified Tumor Registrars. Staff from the epidemiology section of the department also provide support for the registry (four epidemiologists and six analysts); the epidemiology staff are also extensively involved in research, much of which revolves around the cancer registry and linkage to other population-based datasets.

Reporting of cancer has been mandated by law since 1956. Case finding is passive, and multiple sources of ascertainment are used. These include physician notifications, pathology and cytology reports, and hospitalisation, mortality and autopsy records. Cancer registrars collect, classify and maintain comprehensive information on cancer patients. Quality control is an important part of cancer registration in Manitoba, and the registry has been consistently certified by NAACCR for the past eight years.

Interpreting the results
The cancer statistics presented in this volume may be influenced by diagnostic and early detection technologies. The most significant effect is expected to be increased breast cancer incidence resulting from the establishment of the provincial breast screening programme in 1995. An organised cervical cancer screening programme was initiated in 1999. Opportunistic screening for prostate and colorectal cancer occurs, but the magnitude of these practices—and therefore the effect on cancer incidence rates—remains unknown.

Use of the data
The data are used to answer questions relating to the whole spectrum of cancer control in Manitoba. They are also used for surveillance, research, evaluation, planning and teaching purposes and to provide diagnostic confirmation and treatment-related information to healthcare providers.

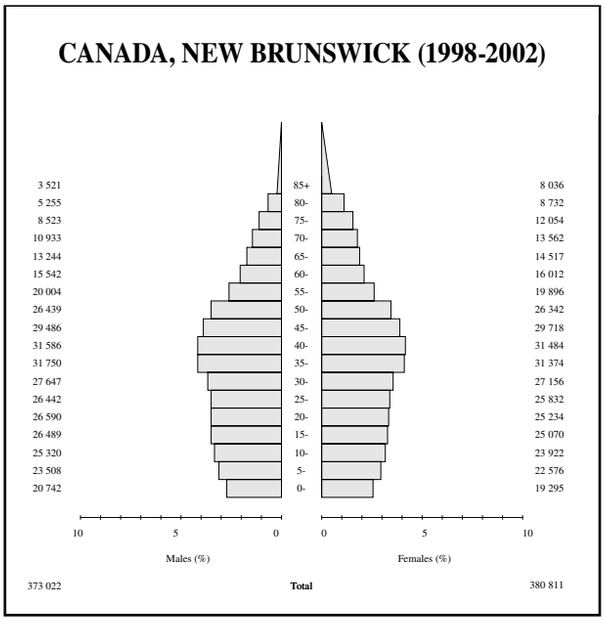
Source of population
The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Canada, New Brunswick

Registration area
The New Brunswick (NB) registry covers the population of seven regions and eight Regional Health Authorities within the province. The provinces of Quebec, Nova Scotia and the state of Maine, USA border NB. The population at the most recent census (2001) was 729 498. About 50.4% of the population lives in urban areas (>1000 and no fewer than 400 persons per km^2). There are seven cities, none of which has a population greater than 100 000.

In New Brunswick, religious makeup as reported by the Statistics Canada 2001 census is reported as 54% Catholic, 37% Protestant and 8% with no religious affiliation. Men account for 49.4%, of whom 6% are over 65 years of age, compared to women, 50.6% and 8% respectively. Ethnicity is reported predominantly as Canadian and then French, English and Irish.



Cancer care facilities
Medical treatment of cancer focuses on four modalities: surgery, medical oncology, radiation and supportive services. Paediatric oncology cases are generally referred to Nova Scotia or Quebec for initial consultations with a paediatric oncologist. There are two major radiation-based cancer centres located in the southern part of the province in the cities of Moncton and Saint John. In 1993, the second radiation facility was added in Moncton.

Chemotherapy is administered in the major centres and in 12 outreach centres. There is a provincial Breast Cancer Screening Program that was rolled out in 16 facilities in NB in 1995 to service asymptomatic women between the ages of 50 and 69. There is decentralised cervical screening in NB.

There is no organized prostate screening. PSA testing is ordered at the discretion of the urologist or family physicians in the regions.

Registry structure and methods
The registry is a population-based central cancer registry located in Saint John, NB. The registry is funded by the Department of Health and overseen by Provincial Epidemiology Services (PES), which is located in the city of Fredericton.

The registry is staffed by 4 permanent employees, one PES person who serves as liaison between the coding staff and several internal and external parties, such as Statistics Canada, NAACCR, and the Public Health Agency of Canada. The Director of the registry is Director of the Provincial Epidemiology Services and the Provincial Epidemiologist for NB.

The NB registry uses passive case-finding predominantly from pathology laboratories, radiation and haematology centres, death registrations, autopsies and data from other provincial registries. An electronic linkage is conducted annually between Vital Statistics and the registry database to reconcile missing death information and to identify cases where there is a mention of cancer on the death certificate but no abstract is found in the registry database.

The cancer registry is a patient- and disease-oriented database. Persons may have more than one type of tumour in the database, and the rules governing multiple primary tumours are those of the CCR and SEER. NB also registers basal and squamous cell carcinoma of the skin, one of each, per person per lifetime since 1989.

The AJCC TNM classification method is currently used to assign stage to breast cancer cases.

Authorization to submit patient-specific information is derived from Section 21(1), regulation 92-84 of the Hospital Services Act of NB.

Interpreting the results
NAACCR has awarded silver certification to the NB Cancer Registry for years 1997, 1998, 1999, 2000, 2002, and 2003, and gold in 2001. Incidence is grouped according to the Surveillance, Epidemiology and End Results (SEER) Groups for Primary site of ICD-0-3.

Use of the data
The registry prepares a five-year report of cancer incidence and mortality, highlighting trends and changes by region and community. Some special studies of survival of registered cancer cases (breast), as well as epidemiological research, have been carried out. Policymakers use our data to assess the need for specialized oncology services in the regions and to assess costs on insurance reimbursements for various drugs and equipment related to cancer.

Source of population
The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Canada, Newfoundland and Labrador

Registration area

The Registry covers the whole of the province of Newfoundland and Labrador, which lies on the east coast of Canada. The island of Newfoundland is surrounded by the Atlantic Ocean. Labrador is bounded by the Atlantic to the east and the province of Quebec to the west and south. The landmass of the province extends between 47 and 61° N and longitudes 52 and 76° W. The altitude varies from sea level to 1600m in the interior of Labrador. The total area is 371 634 km².

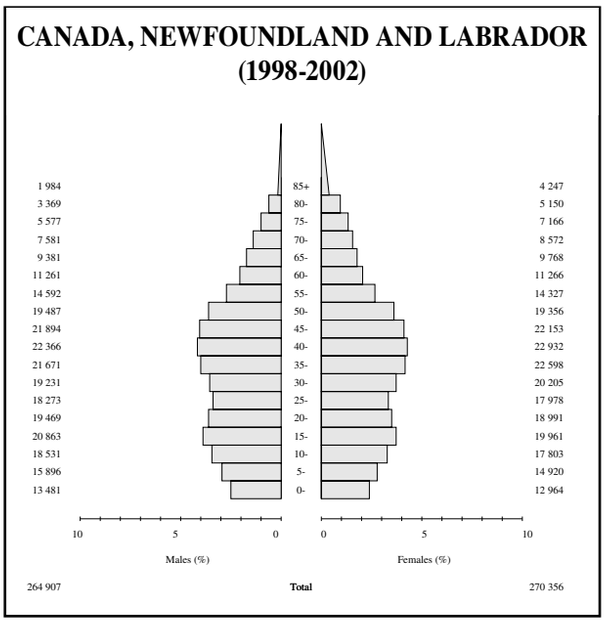
The population according to the 2000 census was 554 076 and in 1991 the population was 568 475. The decrease in population is the result of the net outflow due to migration to other provinces.

Registry structure and methods

The Provincial Cancer Registry was started by the Department of Radiotherapy of St. John's General Hospital in 1954. In 1974, the registry came under the jurisdiction of the Newfoundland Cancer Treatment and Research Foundation (NCTRF). NCTRF was dissolved in 2005 and is know under one of four Regional Integrated Health Authorities. The Newfoundland Cancer Registry is a part of the Provincial Cancer Care Program, Eastern Health, formed on 1 April 2005. Eastern Health is the largest integrated health network in Newfoundland and Labrador, serving a regional population of more than 290 000 and offering unique provincial programs and services. The new health region extends west to Port Blandford and includes all communities on the Avalon, Burin and Bonavista Peninsulas. There are more than 80 hospital, health care centres, long-term care facilities and community care sites.

The Provincial Cancer Registry is located within the Dr. H. Bliss Murphy Cancer Centre, in St. John's. There are regional programs in Corner Brook, Grand Falls-Windsor, St. Anthony and Gander, and regional clinics at the Burin Peninsula Health Centre, Burin; Captain William Jackman Memorial Hospital, Labrador City; and Melville Hospital, Happy Valley-Goose Bay. The Registry is staffed by a full-time director, a manager, a part-time programmer analyst and three full-time health record professionals.

The process for cancer registration is through an Electronic Pathology reporting system (E-Path). The Cancer Registry receives pathology reports electronically from six pathology laboratories through a HL7 interface. Each report is filtered using the ICD-0-3 auto-coding engine. The automated filtering logic examines the topography and morphology codes, and then based on registry reporting requirements selects reports for submission to the registry. E-path has improved the timeliness, completeness and consistency of pathology information.



Cancer is not a reportable disease in our province; the Cancer Act provides a legal mandate for the Provincial Cancer Care Program to establish and maintain a cancer registry.

Interpreting the results

The Cancer Registry is in the process of reactivating a provincial death clearance process. We have purchased a software package (Linkage Wiz) to assist with this process.

Use of the data

The data are used to answer questions relating to the whole spectrum of cancer control in Newfoundland and Labrador. The data are also used for surveillance, research, evaluation, planning and to provide diagnostic confirmation and treatment-related information to healthcare providers.

Source of population

The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used

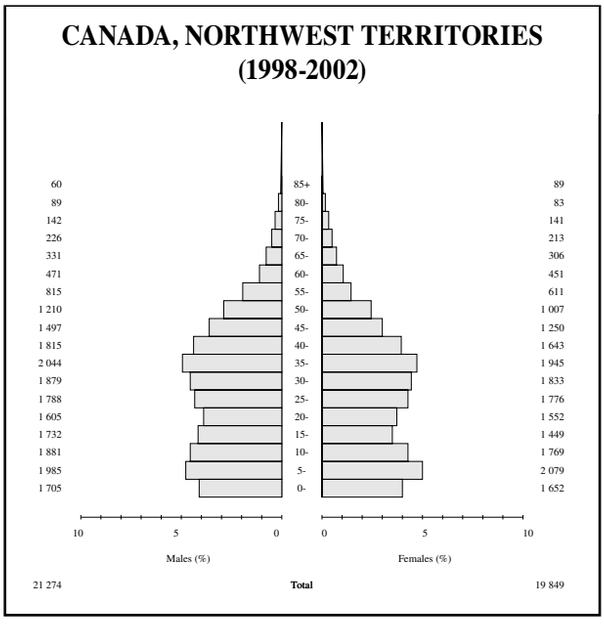
IACR rules (2004) on CI5 IX period.

Canada, Northwest Territories

Registration area
The area covered by the registry is the one of the largest in Canada, yet is sparsely populated. The Northwest Territories (NWT) comprises the area north of the 60th parallel, lying between the Yukon Territory and the Beaufort Sea to the west and Nunavut to the east. The Arctic Ocean forms the northern border, which reaches as far as the 83rd parallel.

All forms of malignancy have been reportable in the Northwest Territories since late 1980. However, the very extensive circumpolar geographical area, which constitutes this jurisdiction, results in an additional reliance on diagnostic service and reporting and may also affect completeness. It should be noted that collection of cancer data was initiated in the late 1950s.

In 2003 the population of NWT was about 42 406 persons living in some 32 communities, half of which had populations of fewer than 500 residents. One-quarter of the population is under 15 years of age. Health programmes and services were provided by eight health and social services authorities and/or boards, reflecting ten official language groups in four ethnic categories (Dene, Inuit, Metis, and non-Aboriginal). Half of the population are Aboriginal people.



Cancer care facilities
In NWT it is possible to perform biopsies, but all diagnostic laboratories are based in Alberta, Canada. It is possible to perform chemotherapy and hormone therapy in the Territories, but there are no radiotherapy departments in the area.

Registry structure and methods
The NWT Cancer Registry is maintained by two registry staff within the Population Health Division, Department of Health and Social Services, Government of the Northwest Territories. These consist of one coder and one analyst. Two are in the process of training to code and we are in the process of having the Alberta Cancer Registry administer the database.

Most formal health services and programmes are provided through community health centres staffed by nurses and visited by itinerant physicians. Three hospitals provide second-line specialist services. However, most tertiary-level services are offered outside the jurisdiction.

All cancers are registered using a form that must be completed by the treating physician at the time of diagnosis. Also, the contract with out-of-territory laboratories requires that a copy of pathology reports indicative of cancer be forwarded to the Registrar. Other sources of information result from an active search of vital statistics, discharge summaries and physicians' notes. The principal sources of information on cancer cases are laboratory reports and discharge summaries. Death certificates are retrieved from the Northwest Territories Vital Statistics office in Inuvik. Informal evaluations are performed to ensure validity and completeness.

Interpreting the data
In 1999, Nunavut separated from the Northwest Territories. Over time we have gained services for mammography and are now able to provide chemotherapy and hormone therapy treatment. Since last year, we now have an oncologist that comes to the territories on a monthly basis.

There is an organized screening programme for breast cancer in the Yellowknife region, and PSA testing is common in our population.

Use of the data
The registry is not currently involved in epidemiological research beyond the production of routine statistics, but policymakers use our cancer registry data for planning and evaluation of health services.

Source of population
The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

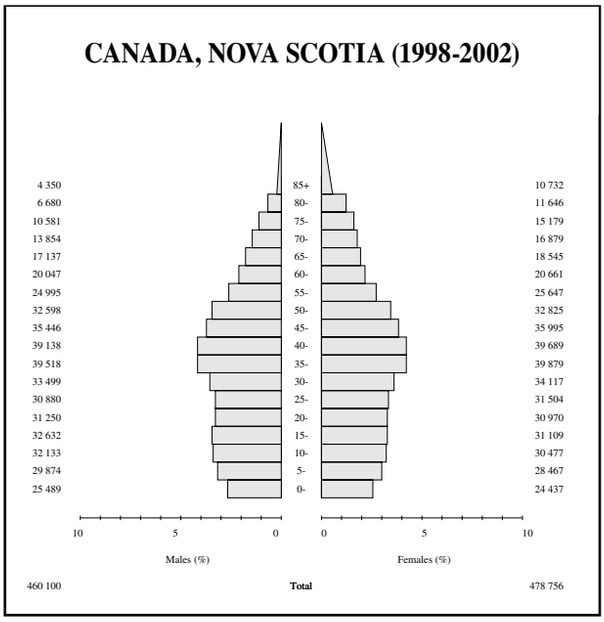
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Canada, Nova Scotia

Registration area

The registry covers the whole of the province of Nova Scotia, one of the three Maritime Provinces of Canada, lying to the south of the St. Lawrence River, east of the Gulf of Maine and south of the provinces of New Brunswick and Prince Edward Island. Although joined to New Brunswick by a central peninsula to the north, it is separated from Prince Edward Island by the Northumberland Strait; to the south, west and east lies the Atlantic Ocean. Most of the province is less than 200m above sea level, the highest point being at 529m in Cape Breton. The province covers and area of 55 491km^2.

At the 2001 census, the total population of Nova Scotia was 932 389, of which 45% report to be of United Kingdom origin, and 16% French while just over 3% indicate North American Indian. Some 40% of census respondents indicate multiple ethnic origins. The active labour force (443 000) was employed in the following categories of industry: manufacturing, 9.3%; construction 6.1%; primary industry (agriculture, fishing, forestry, mining), 4.2%. Almost 80% report being involved in service-related industries (e.g. trade; finance, healthcare, government, education). In 2001, 56% of the population described itself as urban and 44% as rural dwellers. Over 95% of the population who report religion on the census indicate Christian, while 11% did not respond.



Cancer care facilities

All residents of Nova Scotia are covered by a publicly funded comprehensive health insurance scheme. This includes access to family physician and hospital-based care. Many residents have supplemental insurance programs for costs not covered by the public system (e.g. prescription drugs). Since 1993, all residents are assigned a unique health card number that remains with them for life and aids in the maintenance of an unduplicated patient index. Health care is administratively managed and delivered by district health authorities (DHAs). Cancer care is highly centralised, with coordination occurring under a provincial cancer program. There are two main provincial cancer centres that operate satellite facilities across the province for oncology specialist referral and follow-up. Approximately 60% of all patients have some contact with a centre or satellite clinic at diagnosis.

The Nova Scotia Cancer Registry (NSCR) is operated as part of the provincial cancer program and funded by government. It is physically located in Halifax, at a site within the largest district health authority. A total of 12 FTE's are in place (registrars, analytic, administrative staff). Two cancer centres that operate as part of DHAs also have on-site abstracting staff who submit cases to the registry. Cancer has been a reportable disease by law since 1964. The main reporting sources include hospital health record departments (since 1964), pathology/cytology laboratories (since 1964), cancer centres since 1981 (includes all radiotherapy delivery), death record linkage (since 1969) and more recently, screening of visits at targeted clinical areas (e.g. haematology clinics).

Interpreting the results

The NSCR is active in the Canadian Council of Cancer Registries and is a full member of the North American Association of Central Cancer Registries, including participation in the annual certification program. In the five-year period covered by this data submission, several studies were carried out to review case completeness and demonstrated excellent results. New processes have been put in place to target out patient haematological diagnoses. During and at the end of each calendar year, a series of edit checks ensure the quality of data, which are then submitted to Statistics Canada to become part of the Canadian Cancer Registry.

Use of the data

The registry prepares an annual report of cancer incidence and provides this data to users, highlighting trends and changes. A major monograph is produced every five years, and includes incidence, mortality, survival, projections and prevalence analyses. Ad-hoc queries are frequently received and responses provided. Data are also made available for research purposes to ethically-approved studies.

Source of population

The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used

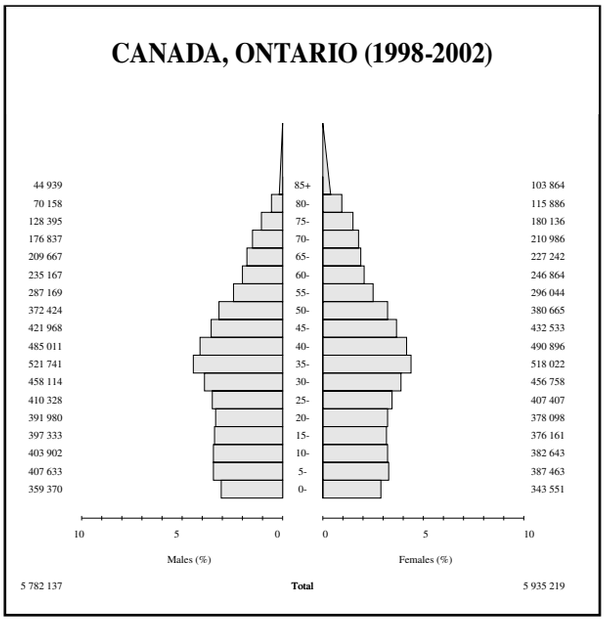
IACR rules (2004) on CI5 IX period.

Canada, Ontario

Registration area
The Ontario Cancer Registry is the largest patient-specific population-based cancer registry in Canada. Operated by Cancer Care Ontario (CCO) since 1964, it covers the entire province of Ontario. The population at most recent census (2001) is approximately 11.4 million people, with over 80% of the population living in urban centres. The major racial/ethnic groups in Ontario are: European 80.9%, South Asian 4.9%, Chinese 3.7%, Black 3.6%, Aboriginal 1.7%, Filipino 1.3%, Latin-American 0.9% and other 3.0%

Cancer care facilities
Cancer Care Ontario is the principal adviser on cancer issues for the Provincial Government. CCO is responsible for long-term planning of the cancer care system and coordination of cancer prevention and control activities and programmes (cancer surveillance, prevention, screening, diagnostic services, treatment, supportive care and research) in Ontario.

CCO does much of its work through 14 Regional Cancer Programs, which are geographically aligned with Ontario's health planning regions (called Local Health Integration Networks, or LHINs). The 12 Integrated Cancer Programs are located in major urban centres, and serve as the hub of the Regional Cancer Programs. CCO continues to directly manage the Ontario Breast Screening Program and the New Drug Funding Program.



Registry structure and methods
The registry operates under CCO's Informatics Unit. CCO's operating expenses were approximately $460 million in FY 2005/06, and it currently has approximately 330 employees, including planners, scientists, analysts, statisticians, clinical and non-clinical managers, technicians and other professionals.

Cancer registration in Ontario is passive, relying almost completely on electronic records collected for other purposes. Close to one million source records are submitted to the OCR each year. Since 1979, the OCR has relied on four major data sources: hospital discharge (including day surgery) summaries that include a diagnosis of cancer; pathology reports with any mention of cancer; records of patients referred to the Integrated Cancer Programs; and death certificates for all underlying causes of death.

While cancer is not a legally reportable disease in Ontario, the Cancer Act provides a legal mandate for Cancer Care Ontario to establish and maintain a cancer registry. Further, under the Cancer Act, any information about a registered case must be kept confidential and not be used or disclosed for any purpose other than for compiling statistics or carrying out medical or epidemiological research. Under the 2004 Personal Health Information and Privacy Act, CCO is also mandated to use this information for planning and management of the cancer system in Ontario.

Interpreting the results
Because of changes in diagnostic practices or rules of coding and registration, interpretation of temporal trends must be done with caution. For example, with the introduction of ICD0-2 in Ontario in 1993, borderline ovarian tumours were now registered as invasive neoplasms; this increased incidence by about 30%. But with the introduction of ICD0-3 in 2002, the classification of borderline tumours reverted from malignant to uncertain behaviour. Thus, incidence seemingly fell by 30%.

Limitations in the range of registered tumours may limit comparability. For example, the Ontario Cancer Registry does not register non-malignant brain tumours, non-melanoma skin cancers, or in-situ cancers, nor is there registration of other cancer precursors (e.g. adenomatous polyps of the colorectum).

Limitations in the accuracy and timeliness of registering and reporting actual incident cases may also be critical factors. For example, annual incidence data are generally not considered final and reported publicly until approximately 18–24 months following initial diagnosis. This may be a limitation for researchers who desire more rapid reporting. Problems in coding consistency and classification constancy may also occur.

Further, new methods of screening and diagnosis can also change patterns of incidence. With rapid diffusion of new methods (e.g. PSA screening introduced in Ontario in 1989) incidence may increase dramatically, often within months, and may distort assessment of the underlying risk of cancer, or present a sudden increase in demand for the cancer system.

Use of the data
The OCR is an invaluable resource for conducting epidemiological studies, and is also used to follow up patients or individuals who may have been exposed to risk factors.

The OCR can also be used to help evaluate the effectiveness of screening programmes. The Ontario Breast Screening Program links its database to the OCR in order to confirm diagnoses of cancer in the screened population, identify interval cancers and verify vital status.

Over the 1990s, use of the OCR expanded to include health care utilisation studies. The availability of data regarding utilisation of hospitals and cancer clinics by

cancer patients as well as details regarding treatment (e.g. surgical procedures) provides researchers with a useful tool in performing these studies.

Finally, with the evolution of CCO into Ontario's planning agency for cancer services, there has been a substantial investment in modern statistical methods of forecasting, as applied to predicting future incidence, survival, prevalence and mortality, over the short (3–5 yrs) and medium (10–15 yrs) terms.

Source of population
The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

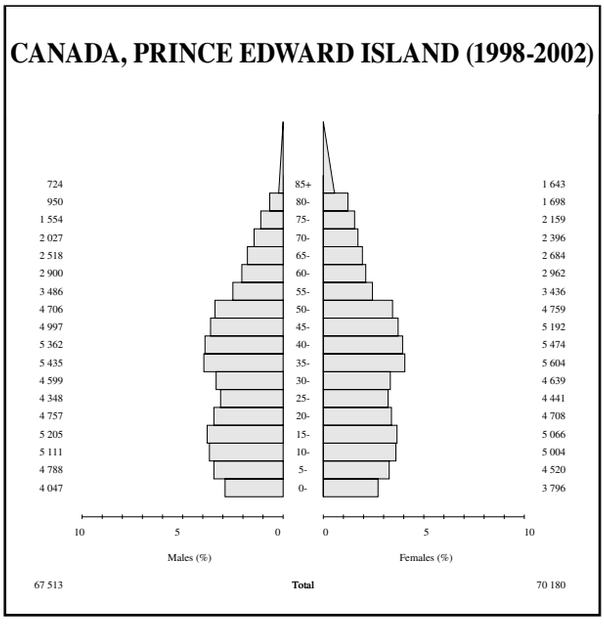
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Canada, Prince Edward Island

Registration area
The registry covers all of Prince Edward Island, the smallest province of Canada, which is situated to the southwest of the Gulf of St. Lawrence, lying between longitudes 62° and 65° W and latitudes 46° and 48° N. The island covers an area of 5684 km².

The population according to the 2001 census was 135 294, with 60 675 being urban and 74 619 being rural. A preliminary population count on 1 July 2005 showed a population of 138 113 on PEI. The male to female breakdown from the 2005 population estimates that 67 198 are men and 70 915 are women. Of these, 11 993 of the females and 12 459 of the males were under age 15. A large majority of the population of PEI is of British Isles origins, followed by French origins. A smaller number are of other European origins.

The primary employment by industry are service sector jobs followed by agriculture and fishing.



Cancer care facilities
The PEI Cancer Registry was formerly part of the Provincial Health Services Authority and is now a division of the Department of Health under the Queen Elizabeth Hospital (QEH) and the PEI Cancer Treatment Centre (PEICTC). Hospital organisation and practice are based on a comprehensive government-organised health insurance scheme. There are no private hospital facilities. Treatment services are provided at the Queen Elizabeth Hospital in the PEI Cancer Treatment Centre. Satellite clinics are held at the Prince County and Kings County Memorial Hospitals, providing medical oncology services. Diagnostic services include CAT scan and MRI, both of which are located in the Diagnostic Imaging Department of the QEH adjacent to the PEICTC. Radiation treatment on a Linear Accelerator became available on Prince Edward Island in October 2003. Previously all radiation treatments delivered on PEI were via a Cobalt 60 machine. All radiation treatment necessitating a Linear Accelerator required travel to another province prior to this time. There is an organised Breast Screening program in PEI. There is no formalised colorectal screening program. PSA testing and colorectal screenings are done at the discretion of the physicians.

Registry structure and methods
The PEI Cancer Registry commenced with cancer collection in 1969 and has been submitting cancer data nationally to Statistics Canada since then. The registry personnel consist of the director (medical oncologist), the manager (1FTE) and a health records technician (.5 FTE). The PEI Cancer Registry is not currently involved in any epidemiological research projects but did participate in the National Enhanced Cancer Surveillance study.

The main source of data for the registry is pathology reports with a diagnosis of cancer, copies of which are sent to the registry from the provincial pathology laboratory. The registry has 98% completeness using the Canadian I/M ratio. The percentage of microscopically confirmed cases for PEI was 93% for the 2003 data submission year. Additional data necessary for cancer registration are obtained from the outpatient cancer treatment centre charts and hospital charts. Physicians and nursing homes are also contacted as needed to obtain information. Electronic sources of data available to the cancer registry staff include the radiology information system, and the laboratory case management system. Death lists are sent from Vital Statistics to the registry monthly. All deaths with mention of cancer are researched and followed back to ensure all cases are registered. Death certificates as the only source of information comprise a very small number of registrations due to the rigorous follow-up procedures; in fact for the 2003 data submission year there were no cancer registrations in which death certificates were the only source of the cancer registration data.

The registry staff follows up on any cases that require further information for registration. The small size of the province and the accessibility of information enable staff to complete cases with a very high degree of quality. The implementation of an electronic health record in the spring of 2007 will further enhance the ability of the registry to follow up cases for further information.

The registry started to collect staging information on all breast and colorectal cancers starting with cases diagnosed in 2003. Staging information on all lung and prostate cancers was added for diagnosis year 2005 with the expectation of stage collection on the whole incidence file in future years. The time frame for this is financial/human resource dependant. The registry staff has received formalised training on the staging of breast, colorectal and lung cancer using the Collaborative Stage method of data collection, with prostate and head and neck sites completed in September 2006 and 2007 respectively. The manager of the registry has been very involved in the national implementation of stage collection and is currently one of six Canadian staging specialists providing training to other cancer registrars. The manager of the cancer registry keeps the statistics for cancer incidence as well as all workload statistics for the PEICTC, which are used by policymakers for future planning of required health services.

Source of population
The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used
IACR rules (2004) on historical data.

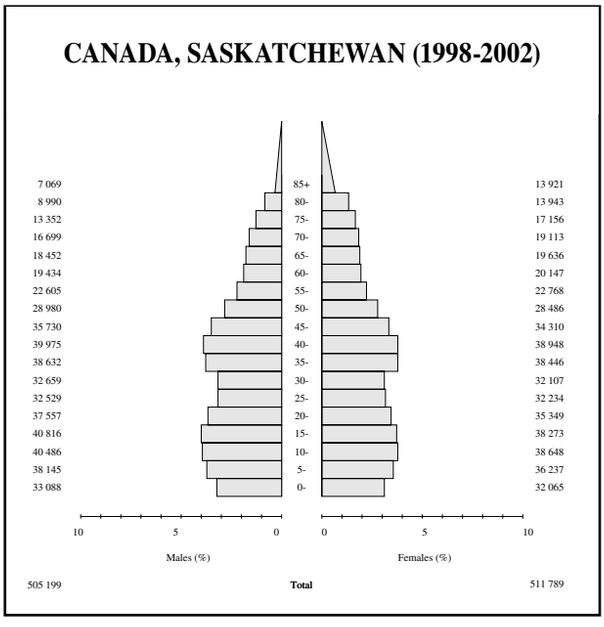
Canada, Saskatchewan

Registration area

The registry includes all of Saskatchewan, a province of 651 903 km^2 located between Alberta to the west, Manitoba to the east, the Northwest Territories to the north and the USA to the south. Saskatchewan is between latitudes 49 and 60 N and longitudes 102 and 110 W. Most of the province is at or above 300m altitude, and the majority of the population live in the southern half of the province.

Among provinces, Saskatchewan ranks sixth in population with 990 930 people according to the 2006 census estimate. The population of Saskatchewan is of mixed ethnic origin. More than 40% of inhabitants trace their ancestry to the British Isles. The next largest ethnic groups claim German, French, Ukrainian, American Indian, Metis and Scandinavian ancestry. Indigenous peoples, mainly Cree, Assiniboine, and Chipewyan account for 17.3% of the population.

Approximately 64% of the population resides in cities of more than 5000 inhabitants, including Saskatoon (237 017) and the provincial capital, Regina (200 854).



Cancer care facilities

The Saskatchewan Cancer Commission Act of 1930 authorised a commission to establish a cancer control program in Saskatchewan. In 1979, the Saskatchewan Cancer Foundation Act established a new organisation to replace the Cancer Commission. The Saskatchewan Cancer Agency is now responsible for treatment, prevention and early detection programs, research, and education services. The Agency maintains two clinics, the Allan Blair Memorial Clinic in Regina and the Saskatoon Cancer Centre in Saskatoon, which provide radiotherapy, chemotherapy and follow-up services. The Agency also has two Cancer Patient Lodges associated with the clinics, a Health Research Division, a Screening Program for Breast Cancer, a Prevention Program for Cervical Cancer, as well as an Education Division. The Screening Program for Breast Cancer was established in 1990 and the Prevention Program for Cervical Cancer began in 2003.

Registry structure and methods

The province is covered by a universal comprehensive health insurance plan. The Cancer Foundation Act mandates that all cancers be reported to the Agency. This reporting structure captures approximately 95% of our case ascertainment. The other 5% is captured through death certificate notification received monthly from the Vital Statistics branch of Saskatchewan Health. The Saskatchewan Cancer Agency is funded by the Saskatchewan Government. The Registry is staffed by 10 FTE cancer registrars, 2 supervisors, 1 coordinator and the director.

Complete computerised information is available on all cancers diagnosed since 1967. There are currently about 212 200 patients and about 281 000 case records on the database. The registry also records follow-up information on approximately 36 000 clinic examinations per year and 25 000 physician reports each year. All cancer cases in the database are coded according to ICD-O-3. Causes of death from cancer are coded using ICD-10, and non-cancer causes of death up to 1999 remain as ICD-9. In 2005 the Registry started using Collaborative Staging for breast and colon cancers. In 2006 additional cancer sites will have collaborative staging applied to them. The Saskatchewan Cancer Registry is a member of the Canadian Council of Cancer Registries and the North American Association of Central Cancer Registries (NAACCR). Our data are submitted annually to the Canadian Cancer Registry and the NAACCR.

The quality of the registry data is maintained through internal edit processes at the point of data entry as well as yearly processing of edit checks. Edits are also conducted by Statistics Canada/ Canadian Cancer Registry and NAACCR on the data we submit to them for quality, accuracy, timeliness and completeness. Statistics Canada now produces a "report card" each year; both the Statistics Canada report and the NAACCR report outline our results and subsequent areas for improvement.

Patient follow-up has been active since 1932. Every case diagnosed (excluding non-melanoma skin cancer) is reviewed at least annually either through an examination at one of the clinics or through our follow-by-mail program, which sends letters to family/referring physicians at regular intervals for 10 years minimum. Although this program is still used as a method of survival/recurrence analysis, it now also helps ensure continuity of patient care once the patient is discharged from the Clinic. The response rate to these letters is approximately 98%. The Registry began performing an active follow-back process on all registered DCO cases in 2002.

Interpreting the results

The vast majority of the population is involved in farming, which may result in higher exposure to pesticides, herbicides, fungicides etc. Recent literature also suggests a link between cancer and diabetes; if substantiated this could have a huge impact on our First Nations population that have a higher rate of diabetes.

Use of the data

The Cancer Agency will be producing its third annual Cancer Control Report this year. The information in the registry also supports Agency planning for cancer control services and is also used as an information source for various research studies.

Source of population

The population–at–risks by sex and age from 1998–2003 have been estimated using the adjusted intercensal or postcensal estimates based on the 1996 Census, as provided by the Population Estimates Section, Demography Division, Statistics Canada.

Multiple primary rules used

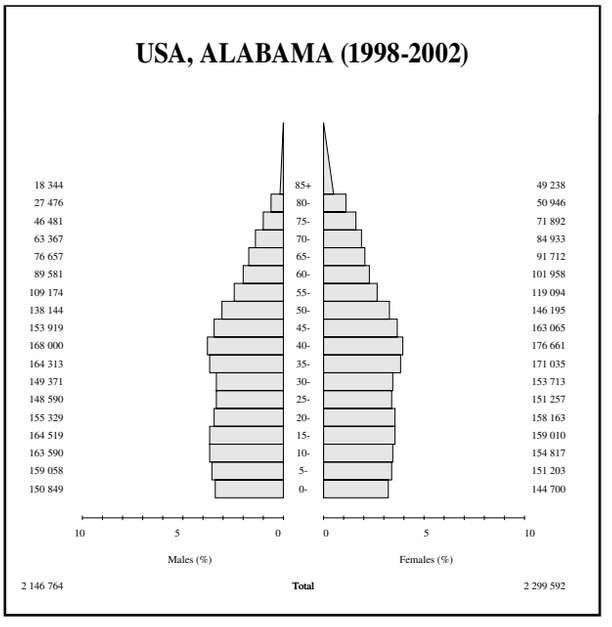
IACR rules (2004) on CI5 IX period.

USA, Alabama

Registration area

Alabama is located on the southern coast of the United States. The state is divided into 67 counties, and the state's largest city is Birmingham, located in the central region of the state. Among the 50 states, Alabama ranks 30th in size, covering 52 423 square miles. According to the 2000 U.S. Census, it the 23rd most populous state, with 4 447 100 residents, and the state's population is projected to increase to 4.8 million by 2010 (Alabama Dept. of Industrial Relations). According to the Census Bureau, Alabama is considered an urban state with 55 percent of its population living in an urban setting and 45 percent in rural areas. Nearly every county in Alabama has some rural population, even the most densely settled counties, but some sparsely settled counties have no urban population at all.

Residents of Alabama are predominantly white (71.1%), with a significant African-American population (26.0%). Hispanics make up 1.7% of the state's population, though Birmingham has been ranked 6th among US cities with the fastest growing Hispanic population (http://apha.confex.com/apha/133am/techprogram/paper_112388.htm). Asians make up 0.7% of the state's population, and Native Americans 0.5%. Alabama has a large number of prime workforce-age residents, with 29% of the state's population between ages 25 and 44.



Cancer care facilities

Cancer is a reportable disease under Alabama Act 95-275. There are 55 healthcare facilities in the state that have fully staffed and functioning cancer registries, along with 54 non-registry facilities who utilise independent CTR contractors to capture and report cancer data. In addition, there are 22 free-standing treatment centres, 36 physicians or physician groups and 13 pathology laboratories that currently report to the ASCR.

Full-service cancer health care is provided by many hospitals in Alabama including two academic teaching facilities. Physicians also deliver limited diagnostic and treatment services in office settings. There are 25 free-standing cancer centres (including radiation centres) and clinics that also provide a full scope of therapeutic options for their patients.

Registry structure and methods

The ASCR is housed in the Bureau of Health Promotion and Chronic Disease of the Alabama Department of Public Health. The ASCR staff comprises 12 permanent employees, including an Administrative Director, a Program Manager, an Epidemiologist, an Operations Analyst, and four Regional Coordinators (RC), three of which also have additional functions within the registry such as Completeness Coordinator, Quality Assurance Coordinator, and Education Coordinator. In addition, the ASCR has a Death Clearance and Research Coordinator, two case finding auditors and an Administrative Assistant.

The ASCR is supported through Federal funds under the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). The ASCR does not currently receive any state funds except through support from five county health departments, which provide office space for regionally-based staff.

Electronic reporting is currently being phased in with pathology labs and physician groups. All other reporting sources report via the ASCR's secure website. Thirty-eight of these healthcare facilities are certified by the American College of Surgeons and report approximately 80% of Alabama's incidence.

Interpreting the results

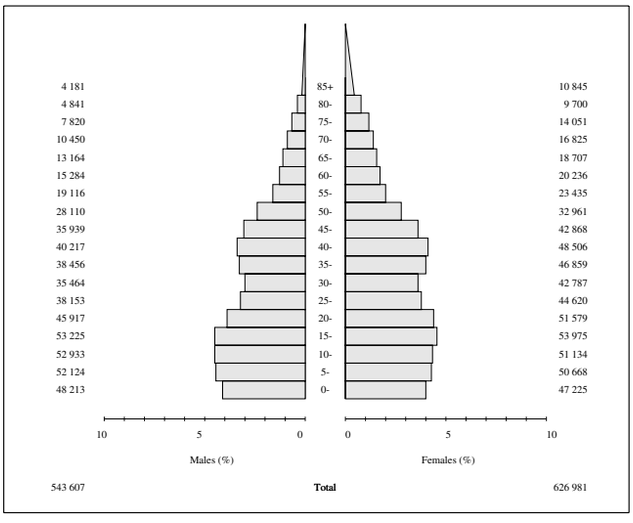
Alabama has captured at least 95% of its expected caseload over the past several years, and is proud to provide a high quality, statistically useful database.

Screening programs are offered through hospitals, physicians and community organisations such as the American Cancer Society for sites such as breast, skin, colorectal, and prostate. The Alabama Breast and Cervical Cancer Early Detection Program (ABCCEDP) offers screenings for breast and cervical cancers. Prostate Specific Antigen (PSA) testing is a common practice used by healthcare providers in Alabama.

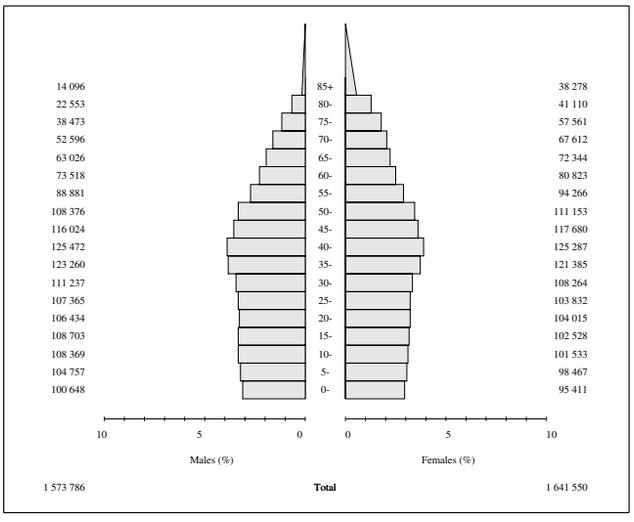
Use of the data

The ASCR, in conjunction with the American Cancer Society's Alabama Affiliate Office, prepares an annual report of cancer incidence, highlighting trends and changes, as well as the efforts of Alabama's Comprehensive Cancer Control Program. In addition, the ASCR collaborates with researchers and Principal Investigators across Alabama and around the US on special data linkages and research projects addressing issues from cancer prevalence to disparities in care. The ASCR limits participation in such activities to twelve open research projects at any given time.

USA, ALABAMA: BLACK (1998-2002)



USA, ALABAMA: WHITE (1998-2002)



Source of population

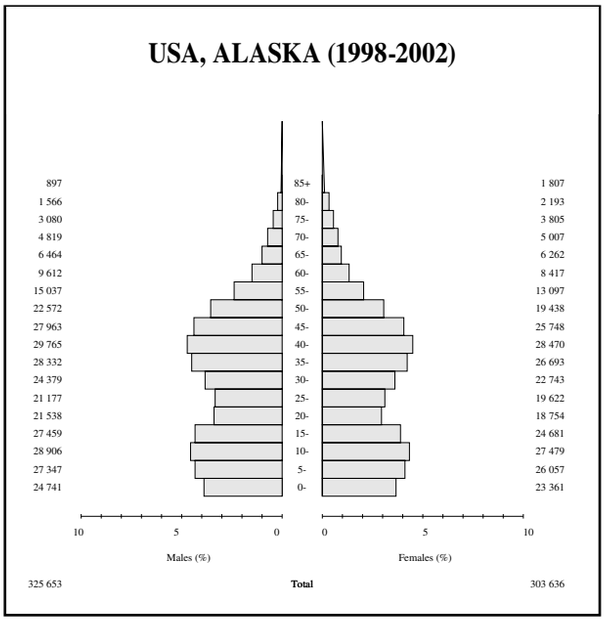
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Alaska

Registration area
The Alaska Cancer Registry (ACR) covers the population of the State of Alaska, the northernmost state in the United States. Alaska represents 16% of the total land area of the country, but only 0.2% of the country's population. The population at the most recent census (2000) was 626 932. The state is divided into 27 county-equivalent areas of municipalities, boroughs, and census areas. Most of the state is rural and sparsely populated. About 42% of the population lives in the Municipality of Anchorage (260 283), although Anchorage represents only 0.3% of the land area of the state. The top five county-equivalent areas in the state (Municipality of Anchorage, Fairbanks North Star Borough, Matanuska-Susitna Borough, Kenai Peninsula Borough, and Juneau Borough) make up 77% of the state's population and represent only 9.2% of the land area. The statewide population is 73.5% White, 17.2% Native Alaskans or American Indians, 5.1% Asian or Pacific Islanders, and 4.3% Black.

Cancer care facilities
General healthcare in the state is provided by 24 hospitals, numerous health clinics, and many private practitioners. Because the Anchorage Municipality has the highest population, it also has the highest number of healthcare facilities, including four hospitals. In rural areas, many boroughs/census areas only have one hospital, and some have no hospitals. Alaska Natives are provided healthcare at no cost at a central hospital in Anchorage.



Registry structure and methods
ACR is located in the city of Anchorage, and is part of the Alaska Department of Health and Social Services, Division of Public Health, Section of Chronic Disease Prevention. It is funded mostly by the US Centers for Disease Control and Prevention (CDC) through the National Program of Central Cancer Registries (NPCR), and partly by the state health department. ACR is staffed by a full-time manager, three full-time registrars, and a full-time data analyst. Several full-time administrative clerks provide part-time support for the program.

Cancer is a reportable disease by state law; a hospital, physician, surgeon, or other healthcare facility or provider diagnosing, screening, or providing treatment for a cancer patient is required to report to the registry. The annual caseload for ACR is approximately 2000 consolidated cases per year. ACR receives about 50% of its case reports (source records) electronically from hospitals in the standard NAACCR Record Layout. Electronic cases are also received from other state central cancer registries in the United States with which ACR has data exchange agreements (currently ACR has 30 of these agreements). The rest are manually abstracted in-house by the registrars. The manual case reports consist of hardcopy medical records sent to the registry by hospitals, private physicians, and pathology laboratories.

Manual case reports are also generated as a result of casefinding audits of hospitals and death clearance. Casefinding audits are conducted by reviewing the medical disease index from the hospital for a given time period for cancer cases and removing cases that have already been reported by the hospital. The remaining cases are researched by the registrars, and new cases are added to the registry. Death clearance is performed by comparing a list of all Alaska resident cancer deaths for a given time period against the registry database and removing death cases that have already been reported by other sources. The remaining cases are researched by the registrars, and new cases are added to the registry.

Quality control is performed on the data on a regular basis. All new cases need to pass at minimum the "NPCR Required", "NPCR Supplemental", and "Site/Type--Over-rides - Missue" Edit Sets of the current NAACCR Edits Metafile. In addition, during the annual NAACCR and CDC Calls for Data, the data submission file must pass specific Edits Sets specified by NAACCR and CDC at the time of data submission. Also during the Calls for Data, ACR runs specific database queries to check for data quality.

Interpreting the results
There are no unusual geographical, clinical, or coding factors that influence incidence rates. However, the Alaska Department of Labor publishes annual population estimates for Alaska that are different from those published by the federal government (CDC's National Center for Health Statistics). The incidence and mortality rates ACR generates are based on federal government's population data.

Use of the data
ACR prepares an annual report of cancer incidence and mortality. Data are submitted annually to NAACCR and CDC for use in multi-registry databases and data reports. In addition, registry data are regularly requested by members of the US Congress, the Alaska state legislature, researchers, physicians, researchers, and the general public.

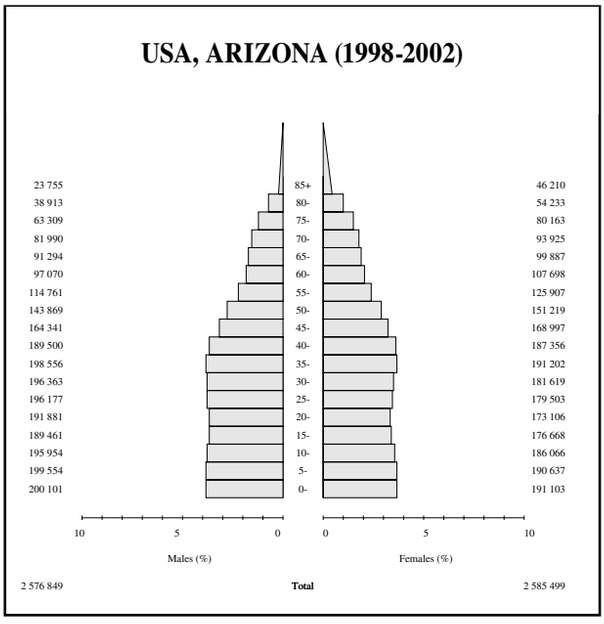
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Arizona

Registration area
The Arizona Cancer Registry covers the population of the State of Arizona in the United States of America. Arizona is located in the west in the Rocky Mountain region. The population at the most recent population census projection (2005) was 5.8 million. About 89% of the population lives in urban areas (>5000 population). Arizona has the second largest state concentration of Native Americans in the United States, comprising 5% of the population. The racial breakdown of the population in Arizona is: White Non-Hispanic 60%, Hispanic 29%, and all other races, Non-Hispanic 11%.

Cancer care facilities
General health care in the region is provided by private practitioners, clinics, and hospitals. Health insurance is used by 82% of the population to pay for health care. Most health insurance is private, non-governmental insurance (75%) of healthcare coverage. The amount the insurance plan pays varies greatly between health plans. The remainder of health insurance is provided by the government. There are both hospital and freestanding radiotherapy departments in Arizona.



Registry structure and methods
The registry is located in Phoenix, Arizona, the state capital. The registry receives its funding from state legislature appropriations to the Arizona Department of Health Services. Enhancement funds are provided through the National Program of Cancer Registries (NPCR) from a US Centers for Disease Control and Prevention cooperative Agreement. The registry is staffed with 13 FTE's and comprises three sections, Operations, Data, and Training.

The ACR is considered a population-based surveillance system that collects, manages, and analyses information on the incidence, survival, and mortality of persons having been diagnosed with cancer. Arizona Revised Statute §36-133 mandates the reporting of cancer cases in the state of Arizona. Reporting rules (Arizona Administrative Code Title 9, Chapter 4) require hospitals, clinics, and physicians to report cases to the ACR. The registry also collects information from pathology laboratories. All hospitals are required to perform follow-up on cases. All data reported from hospitals is electronic. The registry also performs a linkage with vital records on the death certificate file. The registry also performs case ascertainment reviews and reabstracting studies at hospitals. The registry has 17 data exchange agreements with other US states, including all bordering states.

The sections of the registry are as follows: The Operations section processes incoming case information from hospitals, clinics, and physicians. The quality assurance program is a comprehensive program that includes reviewing data to ensure completeness and accuracy, visual editing and immediate and batch editing. The staff also collects cases from facilities that do not report directly to the registry, including hospitals with fewer than 50 beds and pathology laboratories.

The Data section analyses the incidence, mortality and survival of people diagnosed with cancer in Arizona. It provides this data to cancer support organizations and government agencies as well as to researchers, members of the medical community and the public. The section also audits reporting hospitals, to identify areas for improvement when abstracting and reporting cases.

The training section plans and administers a statewide training program for registry staff, reporting facilities including hospital and clinic personnel, and physicians and their staff. In addition, the training section develops written materials such as brochures and newsletters. Finally, it is also responsible for keeping cancer registry and reporting facility staff updated of coding and regulatory changes.

Interpreting the results
The rate of cancer in Arizona is stable, with rates of increase and decline following United States trends. Arizona age-adjusted incidence rates of cancer are generally lower than the overall United States cancer rates. Completeness of data coverage is between 90 and 95%. Arizona has organised screening programs for breast, cervical, and colorectal cancer. Over half of all men over age 40 yrs are screened for prostate cancer using the PSA test.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. The registry also is involved in research studies that have been approved by our Human Subjects Review Committee. Data are used for comprehensive cancer control planning; to respond to concerns in the community about cancer; to assist in the identification of geographic regions of the state that need intervention programs or epidemiologic research, detection, and prevention; to perform epidemiologic studies; and to provide biostatics and epidemiologic information to the medical community.

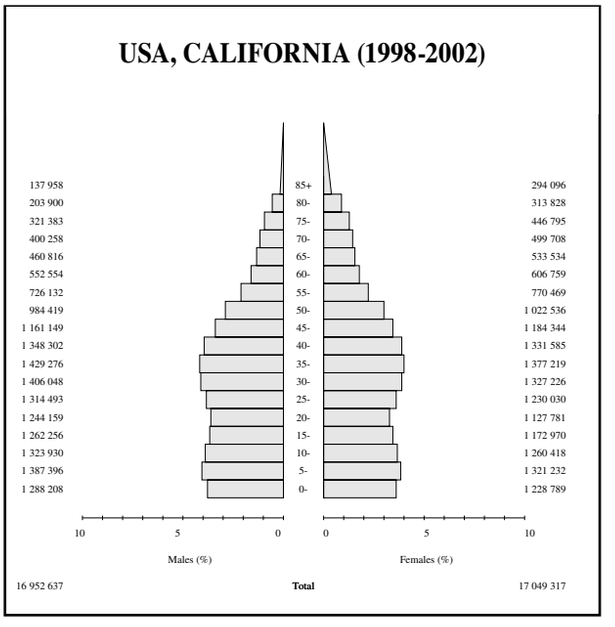
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, California

Registration area

The California Cancer Registry (CCR) is a collaborative effort between the California Department of Public Health Cancer Surveillance and Research Branch, the Public Health Institute, and ten Regional Cancer Registries. These Registries encompass all of California's approximately 156 000 square miles (404 000 km^2). All cancers, with the exception of basal and squamous cell skin cancers and in situ cervical cancers, diagnosed among California's 34 043 198 residents are considered reportable cancers. California is not only the most populous state in the United States, but also the most ethnically diverse, with substantial Hispanic, African-American, and Asian-American populations in addition to a large non-Hispanic White population. There are also a wide variety of religious affiliations, socioeconomic levels, and sociocultural characteristics within California.



Cancer care facilities

Health care in California is provided by a variety of health care facilities, including approximately 422 acute care hospitals, 42 radiation therapy centres, 308 free-standing surgery centres, and numerous healthcare clinics. This care is supplemented by more than 80 000 physicians, both general practice and those specialising in oncology.

Registry structure and methods

Legislation declaring cancer to be a reportable disease in California became effective in 1985. Statewide collection of cancer cases began in 1988 under the Statewide Cancer Reporting Law. Additionally, state law mandates that hospitals and physicians report all cancer diagnoses to their Regional Registry. While recent legislation has made all CCR data variables confidential, CCR has always considered personally identifying information to be confidential.

The Central Registry of the CCR is located in Sacramento, California; there are eight Regional offices throughout California, housing the ten Regional Registries. All of California participates in the Surveillance, Epidemiology, and End Results (SEER) Program, although there are three separate SEER Registries within California. The San Francisco Bay Area Registry became a SEER Registry in 1973, with four adjacent counties added in 1992. The registry in Los Angeles County became a SEER Registry in 1992. The remaining areas of California, known as the Cancer Registry of Greater California, became a SEER Registry in 2000. The CCR also participates in the National Program of Cancer Registries (NPCR) at the US Centers for Disease Control and Prevention (CDC) and annually submits statewide data for inclusion in the NPCR Cancer Surveillance System. The CCR database currently contains approximately 2.5 million records for cases diagnosed 1988 forward, and adds approximately 150 000 new cases to the database each year.

The Central Registry in Sacramento houses numerous research scientists, quality control staff, IT programmers, and fiscal and administrative support staff. Additionally, each Regional Registry maintains their own office of epidemiologists, research scientists, certified tumour registrars and support staff.

The CCR combines elements of an active and a passive surveillance system at both the Regional and Central Registry levels. Active follow-up includes letters to physicians and telephone calls to patients. Passive follow-up involves computer linkages to vital statistics, voter registration, credit records and medical resources. These various surveillance systems have allowed CCR to follow up over 95% of patients.

Over 90 percent of cancer reports are received electronically from hospitals, using hospital-based computer software supported by the CCR. Regional Registry staff also routinely review the records of outpatient radiation and surgery centres, as well as all non-hospital based pathology laboratories to identify unreported cases. Physicians complete cancer reports of patients diagnosed or treated in non-hospital facilities. All CCR data are edited for completeness and accuracy and then are checked by computer for allowable codes and compatibility between different data fields. Regular audits are conducted at selected hospitals to check for completeness and accuracy.

Interpreting the results

The CCR makes efforts to identify persons who resided in California at the time of diagnosis, but were diagnosed or treated in another state. California has case-sharing agreements not only with neighbouring states, but also with many states throughout the nation. While there have been no changes in the area covered by the CCR, the population in California has steadily increased since its 1988 inception. Efforts to improve screening rates among immigrant and low-income populations through community outreach programs have increased over the years. Cancer incidence in California is similar to that in other parts of the United States; however an aggressive anti-smoking campaign has resulted in the dramatic reduction in smoking-related cancers in recent years.

Use of the data

The CCR produces an annual report of cancer incidence and mortality in California for all of the major cancer sites. This report lists rates by year of diagnosis, sex, race/ethnicity, and age. Additionally, each Regional Registry produces an

annual report that lists rates by county. CCR data is used by researchers throughout the United States to investigate causes of cancer, survival, quality of care, tumour characteristics and treatment. Since 1988, researchers in California have used CCR data in 450 funded studies and have published nearly 1700 articles using CCR data. CCR data also are used by policymakers and currently are being utilised by California's cancer control planning organisation to measure the burden of cancer in California and evaluate interventions to reduce incidence and mortality.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, California, Greater San Francisco Bay Area

Registration area
The registration area includes nine counties (Alameda, Contra Costa, Marin, Monterey, San Benito, San Francisco, Santa Clara, San Mateo, Santa Cruz) in northern California, USA. The US Census counted 6 516 923 persons living in the region in the year 2000. Compared to other parts of the USA, this area is noteworthy for its racial/ethnic diversity, with substantial Hispanic, Chinese, Filipino, and other Asian populations. The majority of the population lives in the urban San Francisco Bay Area, which includes a major financial centre as well as the "Silicon Valley" centre for technology innovation and industry. Overall levels of education and income are higher than USA averages and accordingly, cost of living tends to be higher in the Greater San Francisco Bay Area than in other parts of the USA.

Cancer care facilities
Healthcare services in this region, including cancer screening, diagnosis and treatment, are provided mostly by private hospitals and physicians, but also by publicly funded hospitals, clinics and public health agencies. At least 61 hospitals and over 21 000 physicians treat cancer patients in the region and two major academic cancer centres are located in the region. In addition, there are a number of free-standing radiation centres, surgery centres, and pathology laboratories involved in cancer diagnosis and treatment. A significant proportion of residents receive managed health care services through health maintenance organizations.

Registry structure and methods
The Greater Bay Area Cancer Registry, with a staff of about 50, is operated by the Northern California Cancer Center (NCCC), founded in 1974 as an independent consortium centre for cancer research in Northern California. The registry has been part of the Surveillance, Epidemiology and End Results (SEER) Program of the National Cancer Institute since 1973 and has contributed data to the statewide California Cancer Registry since 1988. Cancer registry efforts at NCCC also include a population-based registry covering four counties south of the Bay Area (Santa Clara, Santa Cruz, San Benito, Monterey) that have been included in the SEER program since 1992 and the California Cancer Registry since 1988. Data from these two registries have been combined to create the Greater San Francisco Bay Area region shown in this volume. In total, this registry contains well over 700 000 incident cases and processes about 30 000 incident cases annually. The registry collects data not only on incident cancer diagnoses but on diagnostic procedures, tumour characteristics (including stage, grade and tumour markers), treatment and survival time. Each patient is given a unique identifying number and multiple primaries designated by sequence number. All patients reported to the registry are followed both actively and passively for vital status to monitor survival time. Active follow-up consists of letters to physicians. Passive follow-up involves computer linkages to vital statistics, voter registration, credit records and medical resources. Through these methods, the registry maintains current follow-up information for over 95% of cancer patients.

Cancer has been a reportable disease by California state mandate since 1987. This law requires that hospitals report to regional registries such as NCCC all cancer diagnoses occurring in their facilities and that physicians report cancers not diagnosed in a hospital. Well over 90% of cancer registry reports are received electronically from hospitals. The registry supports a hospital-based computerised reporting system allowing each hospital to collect, maintain, and easily transmit registry-reportable information and facilitating editing by cancer registry staff. Quality assurance procedures implement SEER and NAACCR standards for visual and computerized editing, reabstractions and audits.

Interpreting the results
The registry identifies cases residing in the Bay Area but who are diagnosed or treated elsewhere through well-established data sharing programs with neighbouring cancer registries. The registry is also linked semi-annually to California vital statistics records in order to identify persons for whom cancer is mentioned on the death certificate but not already reported to the registry. It is estimated that over 98% of cancer diagnoses in region residents are captured by the registry.

Use of the data
Registry data are used primarily for investigating trends in cancer incidence, survival, tumour characteristics and treatment, thus providing a critical resource for monitoring the burden of cancer in the region. Data are routinely combined with California Cancer Registry and SEER program data for larger surveillance efforts. A number of investigators apply each year to access cancer registry information needed to carry out analytic epidemiologic studies of many different cancer types and outcomes. The large and diverse population has made this registry a valuable resource for epidemiologic research into the genetic and environmental causes of cancer, as well as for cancer control interventions and healthcare planning efforts.

USA, California, Los Angeles County

Registration area
Los Angeles County is an urban area covering more than 10 000 km^2 and has the largest population of any county in the United States, with nearly 9.5 million residents in the 2000 census. Among these residents are more than four million self-declared Latinos including more than three million Mexicans, 38 000 Puerto Ricans, 38 000 Cubans and sizeable populations representing various Central and South American countries. There are nearly one million blacks in the county and between 100 000 and 400 000 each of Japanese, Chinese, Koreans and Filipinos. Other major south-east Asian groups include Vietnamese, Asian Indians, Cambodians and Thais. There is wide variation in socio-economic as well as socio-cultural characteristics in the county.

Registry structure and methods
The Cancer Surveillance Program (CSP) of Los Angeles County was started at the University of Southern California in 1970 as part of an epidemiology and biostatistics program. In June 1987, the CSP became one of the ten regional registries of the population-based California Cancer Registry. This registry, established by California law in 1985, places the obligation for identifying and abstracting cancer cases on those facilities where cancer is diagnosed or treated.

The CSP combines elements of an active and a passive surveillance system. Under the active surveillance component, CSP personnel systematically screen pathology reports and other relevant files at all hospitals and free-standing pathology laboratories, as well as some treatment facilities, to obtain pathology reports for each cancer patient diagnosed or treated. For passive surveillance, each hospital or other reporting facility completes a full abstract, including stage and treatment information on every cancer patient diagnosed and/or treated at that facility. For each cancer patient, over 200 data items including disease or medical variables, demographics and administrative descriptors are coded and computerised.

The responsibility for completing reporting at some hospitals is contracted back to the CSP; currently about 9% of all hospital reports in Los Angeles County are so reported. All of the completed abstracts are record-linked by the CSP to the pathology reports obtained under active surveillance to assure that an abstract is completed on every histologically verified cancer case.

Before 1992, linkage with the State of California death tapes was the only means of passive follow-up. However, beginning with 1992 diagnoses, the CSP instituted complete follow-up as a function of its new affiliation with the National Cancer Institute's Surveillance, Epidemiology and End Results (SEER) Program. Follow-up data are collected by record linkages with multiple sources as well as incorporating active follow-up information provided by hospitals.

Manual and computerised record linkages are performed separately with a variety of external data sources, using a sophisticated probabilistic methodology. Multiple primaries are noted by a tumour sequence number. Each data item is checked as an allowable code, and selected interfield checks are performed.

Interpreting the results
Los Angeles County has more than 100 hospitals and clinics, many of them providing screening programs. The availability of cancer screening programs can, in some instances such as PSA for prostate cancer, result in increasing incidence rates.

Cancer mortality rates may not be directly related to cancer incidence rates due to several factors including migration. Differences in classifying cancers by primary site between incidence and mortality data sources may also differentially affect incidence and mortality rates. Furthermore, a cancer may be reported as a cause of death when in fact it is a site of metastasis from other cancer(s).

Race/ethnicity information for cancer incidence is based primarily on information contained in the patient's medical record. Race/ethnicity for cancer deaths, on the other hand, is based on information on the death certificate, which may not always be based on information provided by next-of-kin. The reporting of race/ethnicity in either system may be influenced by the racial/ethnic distribution of the local population, by local interpretation of data collection guidelines, and other factors. Some differences in race/ethnicity-specific rates likely reflect biases of classification rather than true differences in risk.

Use of the data
The CSP is one of the most productive cancer registries in the world, in terms of scientific contributions toward understanding the demographic patterns and the etiology of specific cancers. More than 850 publications using CSP data have been contributed to scientific journals. The registry supports a large ongoing body of research funded mainly by the National Cancer Institute. The CSP also prepares an annual report of cancer incidence and mortality in Los Angeles County and other monographs monitoring the trends and patterns of cancer among the County's populations. As a service to the community, the CSP provides community-wide or hospital-specific data on cancer occurrence. The CSP responds to requests from concerned residents, community physicians, or from the County and State health departments seeking assistance in investigating perceived cancer risks from environmental exposures.

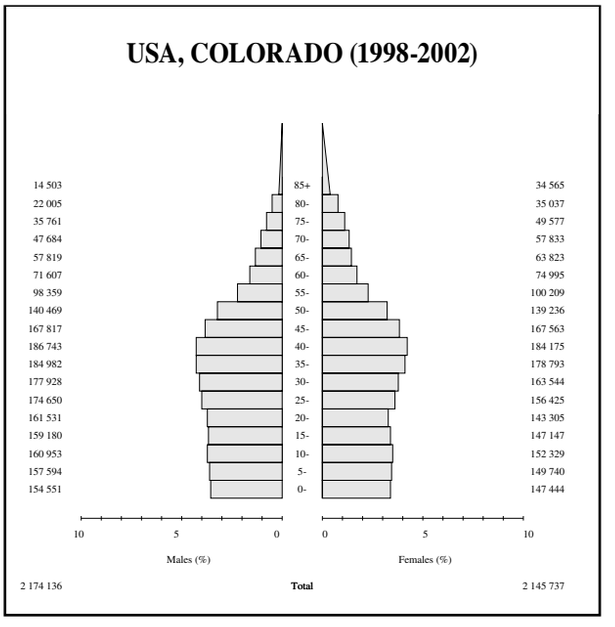
USA, Colorado

Registration area
The Colorado Central Cancer Registry (CCCR) covers the population of the entire state of Colorado (United States). The state is composed of 64 counties with a total population of approximately 4.3 million.

Cancer care facilities
Colorado has 75 inpatient facilities around the state that provide most cancer care; most are privately operated, 2 are public institutions, and 3 are military facilities. Colorado also has many free-standing surgery and radiation therapy facilities, as well as a large network of cancer care specialty clinics that provide radiation and chemotherapy services. Private oncology practitioners also provide care in their offices.

Registry structure and methods
The registry is located in Denver, the capital of Colorado. The registry is funded mostly by federal funds through the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and receives some support from state funding. The registry is staffed by 11.5 FTEs: a Director, 2 statisticians, 1 administrative assistant, 1 data quality and training coordinator, and 6.5 registrars.

Hospitals in Colorado with 50 beds or more must actively report their cancer cases to the Colorado Central Cancer Registry. Staff from the Central Registry travel to smaller facilities once per year to collect data. The CCCR also receives data reports from numerous pathology labs and some of the free-standing radiation and surgery centres. Annually, the CCCR links its database with the official death file for Colorado to obtain follow-up information, and to identify potential missed cases.



Interpreting the results
Colorado has no special characteristics that influence incidence rates.

Use of the data
The CCCR produces an annual report of incidence and mortality. In alternate years, the report includes survival statistics and county-level data. The data are published on the internet and can be queried interactively. The CCCR data are also used for many special studies, including epidemiologic studies, clinical studies, environmental risk analyses, cancer control program evaluation, cancer care facility market analyses, and citizen inquiries.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Connecticut

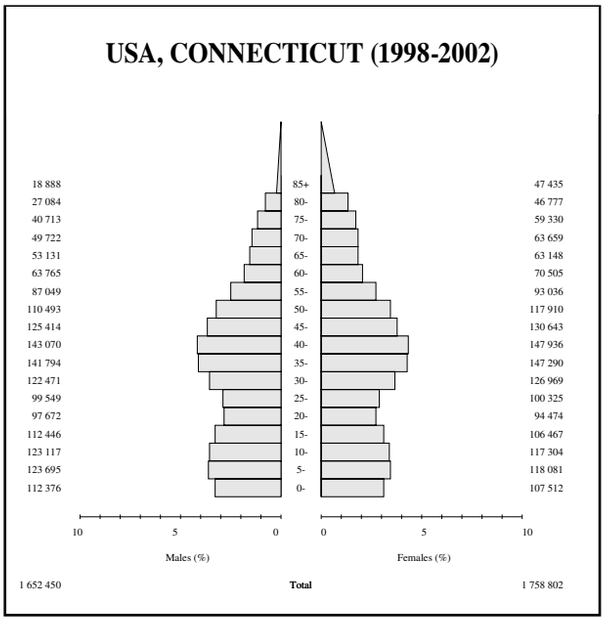
Registration area

The Connecticut Tumor Registry (CTR) covers the entire State of Connecticut, which is bounded by Massachusetts to the north, Rhode Island to the east, Long Island to the south and New York to the west. It lies between latitudes 41° and 42° N and longitudes 71° and 73° W. The total registration area is 12 973 km². At the 2000 census, the population of Connecticut was 3.4 million, composed of 82% white, and 9.1% black. Approximately 9.4% of the Connecticut population is Hispanic, the majority of Puerto Rican origin.

Cancer care facilities

Health care related to cancer is provided predominantly by hospitals in Connecticut, but reciprocal reporting agreements with surrounding states also identify some cases. Most patients suspected to have cancer who are first seen in facilities outside of a hospital are likely to be referred to a hospital for testing and/or treatment.

There are 32 acute care hospitals in the state of Connecticut. All hospitals have diagnostic radiology services; in addition there are many free-standing radiology facilities located throughout the state, operated by hospitals or by private companies. Approximately one third of Connecticut's hospitals have therapeutic radiology facilities. In addition, there are a number of free-standing radiation therapy centres, three of which are privately operated; the remainder are associated with a "parent" hospital.



Registry structure and methods

The CTR is located in the Connecticut Department of Public Health in Hartford, Connecticut. The CTR is funded by the State of Connecticut and the federal government. Since 1973, the registry has participated in the Surveillance, Epidemiology and End Results (SEER) Program sponsored by the National Cancer Institute (NCI). The registry is staffed by over 20 full-time employees including an epidemiologist, research analyst, supervisor, coders, quality control staff and office support personnel.

The CTR is primarily a hospital-based reporting system. All hospitals in Connecticut are required by public health legislation to report incident cases, along with follow-up and treatment information, to the registry. Reports containing pre-coded data are prepared by hospital-based tumour registrars and submitted, either on paper, diskette or electronically, to the registry. In 1981, this reporting mandate was extended to include private pathology laboratories. The CTR also has reciprocal cancer-reporting agreements with all the adjacent states and several other states. This allows for the identification of Connecticut residents whose cancers are diagnosed or treated in other states.

In an effort to increase the accuracy, timeliness and completeness of reporting to the CTR, the registry has implemented a quality control plan. This calls for biannual audits and annual re-abstracting audits of hospitals, regular detailed analysis of reporting errors received by the CTR, regular quality and quantity reports of CTR staff productivity, and training workshops for in-house and hospital registrars.

All death certificates that mention cancer are reviewed and checked against the CTR for prior registration. Follow-back is initiated on all death certificates that do not match to a patient in the registry database.

From its inception in 1941, the CTR has maintained lifetime follow-up on all tumours. Follow-up information is primarily obtained from the hospitals. Follow-up information is also obtained from periodic linkages with the Connecticut mortality files, State of Connecticut motor vehicle license files, the Medicare files of the Centers for Medicare and Medicaid Services, and the Social Security Administration. Although not legislatively mandated to report cancer cases to the CTR, physicians have also been contacted as part of follow-up activities.

To ascertain completeness, we monitor hospitals submissions on a monthly basis; we also send field staff to the pathology departments of all hospitals to perform case-finding audits. All case submissions received from each hospital and private laboratory are visually edited by the CTR's coding and abstracting staff.

Interpreting the results

Lack of reporting of cancer diagnoses from physicians may result in under-ascertainment, mainly for certain cancers treated and diagnosed solely in physicians' or dermatopathologists' offices. The possibility of use of out-of-state pathology laboratories also requires periodic examination.

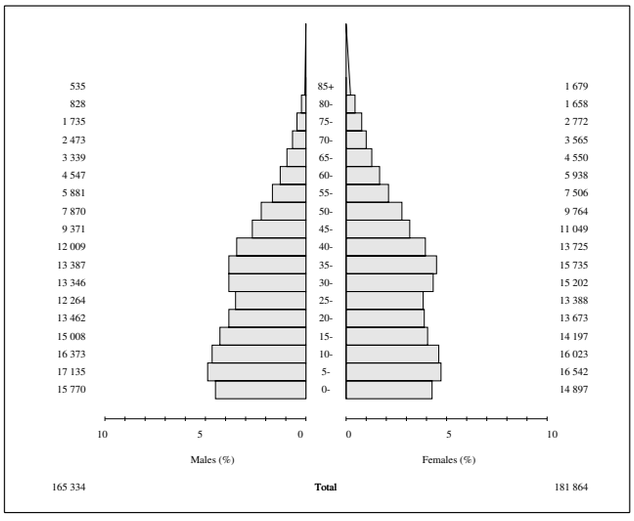
Use of the data

CTR's database contains statistical information on cancers diagnosed since 1935, the earliest year among registries in the USA.

Data from the registry are included with those from other SEER registries in the NCI's annual publication entitled Cancer Statistics Review. This document is used by the NCI as part of the process of setting priorities for research on the prevention and treatment of cancer in the US population. The data the CTR collects are also used to identify priorities and target prevention and control activities in Connecticut, educate the public and health professionals about specific cancer risks, trends and treatments, monitor

cancer incidence and trends and aid research studies. Data from the CTR have been used in hundreds of scientific publications by researchers worldwide, including the Pratt and Whitney Brain Cancer Study. http://www.dph.state.ct.us/. Incidence rates in Connecticut are routinely reported in various monographs produced by the CTR.

USA, CONNECTICUT: BLACK (1998-2002)



USA, CONNECTICUT: WHITE (1998-2002)

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, District of Columbia

Registration area
The District of Columbia Cancer Registry (DCCR) operates within the DC Department of Health (DOH) and serves a total population of 572 059 (2000 census) District residents. The District population consists of about 60% African-Americans, 31% Caucasians and the remainder from other racial/ethnic backgrounds. The gender distribution is 47% males and 53% females. In addition, the District's area hospitals provide cancer diagnosis and treatment to residents from the surrounding jurisdictions (Maryland and Virginia).

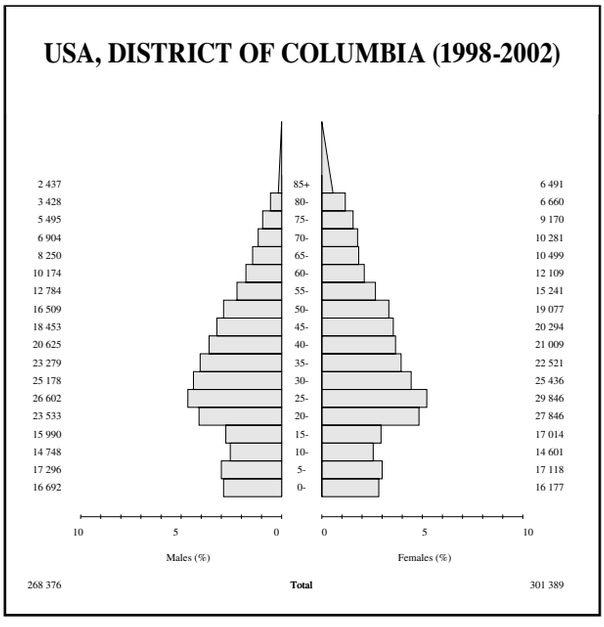
Cancer care facilities
The District of Columbia has 3 teaching hospitals, 1 specialty hospital for children, 2 federal hospitals, and 3 other hospitals. All of the hospitals provide diagnostic and treatment services for cancer patients. Almost all of the radiotherapy departments are located in a hospital facility. Almost all of the District's private practitioners are associated with at least one of the hospitals where cancer patients receive diagnostic and/or treatment services.

Registry structure and methods
The District of Columbia Cancer Registry (DCCR) is located within the DC Department of Health (DOH) and is funded partly by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR), which pays the salaries of 3 staff members and a contractor. The DOH pays the salaries of 2 staff members, one of whom is the Program Director.

Data collection is passive notification of pre-coded data from the hospitals through electronic means (e.g. diskette, CD-ROM, etc.).

The principal sources of information on cancer cases are the hospitals. The District does not have any freestanding pathology laboratories. Death registration is performed by the State Center for Health Statistics where the DCCR obtains a death tape to match the registry database. Death certificates received at the registry are manually entered into the registry's database. For verification, registry staff performs a follow-up by contacting the physician signing the certificate or the institution listed on the certificate where the patient might have died.

Interpreting the results
The number of cases for the District of Columbia has been on a steady decline since the 2000 diagnosis year. Almost all of the decline can be attributed to a decrease in the population. PSA testing is common.



Use of the data
The DCCR prepares and publishes an annual report of cancer incidence and mortality. The DCCR collaborates with the George Washington University on a number of cancer research studies. Some recent titles include:
1. The Association of SES with Breast Cancer Incidence, Grade & Stage at Diagnosis Among Caucasian & African American Women in Washington, D.C.
2. The Role of Race and Poverty in Determining Breast Cancer Patterns in the District of Columbia.
3. Using Demographic Data to Improve Breast Cancer Screening and Education in Underserved DC Communities.

In addition, the DCCR also collaborates with other independent researchers by providing data, or performing data linkage of its data with other databases. The DCCR also performs statistical reviews for the Comprehensive Cancer and Breast Cancer Programs.

USA, Florida

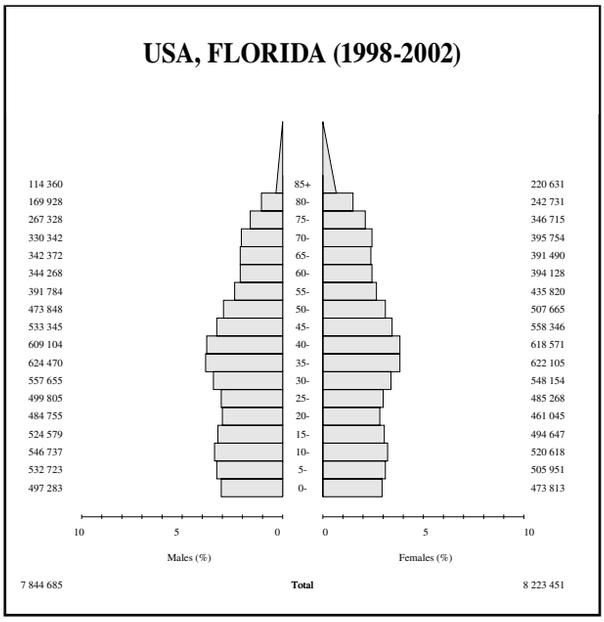
Registration area
The Florida Cancer Data System (FCDS) is a legislatively mandated, statewide population-based registry covering a population of approximately 16 million. The State is comprised of 67 counties. Approximately 95% of the population (~15 million) live in 38 counties designated as Urban by the 2003 Beale codes. The remaining 29 counties are classified as Rural.

Cancer care facilities
There are over 230 primary care facilities reporting data to FCDS. Additionally, data are collected from over 350 ambulatory care facilities, 800 pathology laboratories, the State of Florida Vital Statistics, the State of Florida discharge database and inter-state data exchange agreements.

Registry structure and methods
The FCDS is a joint project of the Florida Department of Health and the University of Miami Miller School of Medicine (UMMSM). The UMMSM has operated the FCDS since its inception in 1981 under contract with the DOH.

FCDS is part of the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and is nationally certified by the North American Association of Central Cancer Registries (NAACCR) at its highest level, gold certification. Gold certification is conferred on central registries that meet or exceed all standards for completeness, timeliness, and quality.

Data collected and coded by the FCDS are in accordance with national standards as put forth by the NAACCR. To code primary site (typography and morphology), the FCDS uses the International Classification of Diseases – Oncology, 3rd edition (ICD-O-3). During the study time period, the national staging criteria were revised. Tumours diagnosed between 1998 and 2000 were staged using the SEER General Summary Stage 1977. Tumours diagnosed between 2001 and 2002 were staged under the SEER General Summary Stage 2000 schema. Both schemas as presented in Table 2 categorise stage of disease as in-situ, local, regional or distant, but the site-specific conversion was not necessarily a one-to-one conversion within and between the regional and distant categories. However because regional and distant staged breast cancer were combined into 'late stage', the revised coding schema had no effect on this analysis, and the year-specific stages could be combined into a common stage variable.



Interpreting the results
The FCDS collects in excess of 95% of cancer cases among Florida residents.

Use of the data
The FCDS prepares an annual report of cancer incidence, highlighting trends and changes, and maintains a web site for dissemination of tabular data. Additionally, data are provided for researchers.

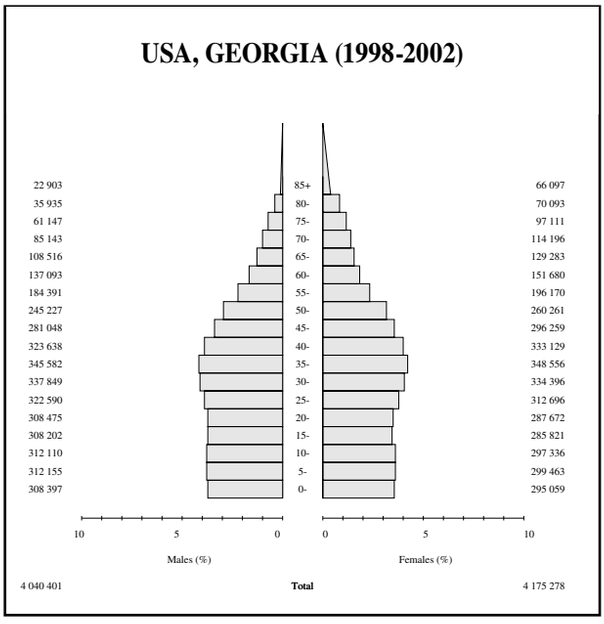
USA, Georgia

Registration area

The Georgia Comprehensive Cancer Registry is a population-based cancer registry covering the population of the entire state of Georgia. The population as of the most recent census projection (2000) is 8 186 453. Based on the 2000 census 65.1% of Georgia population is white, 28.7% black or African American, 2.1% Asian, 0.3% American Indian and Alaska Native, 0.1% Native Hawaiian and Other Pacific Islander, and 2.4% other race. Additionally 5.3% of the Georgia population is of Hispanic or Latino origin. The majority (80%) of Georgians live in urban areas, while 20% live in areas classified as rural.

Cancer care facilities

For each cancer case, facilities are required to report information such as sex, race and date of birth; cancer diagnostic information such as primary site, histology, grade, and date of diagnosis; diagnostic confirmation and stage information such as SEER summary stage 2000 and Extent of Disease (EOD); and treatment information related to first course of treatment such as surgery, radiation, chemotherapy, hormone and other treatment. Additionally information is collected on the patient's vital status.



Registry structure and methods

The Georgia Comprehensive Cancer Registry (GCCR) is located in the Georgia Department of Human Resources, Division of Public Health in Atlanta, Georgia. The registry is funded by the state of Georgia and the federal government. Since 1995, the GCCR has participated in the National Program for Cancer Registries (NPCR) that was established by the US Centers for Disease Control and Prevention (CDC).

The GCCR registry covers the entire State of Georgia, which is bounded by Tennessee and North Carolina to the north, Alabama to the east, Florida to the south, and South Carolina to the west. Reports are prepared by cancer registrars located in hospitals with more than 100 licensed beds and submitted to the central registry. The GCCR's five regional coordinators are responsible for abstracting cancer reports for facilities with less than 100 licensed beds. Independent pathology laboratories submit their pathology reports electronically, and small pathology laboratories whether in-state or out-of-state may submit a photocopy of their pathology reports. Since 2001, the GCCR has conducted a yearly electronic match with the Georgia Hospital Discharge database to identify potential missed cases. Cases identified are researched by the GCCR regional cancer coordinators for reportability; identified missed cases are the responsibility of the facility to report. Additionally, the GCCR conducts death linkage with the State of Georgia death file, and follow-up of missed cases is done via hospitals, nursing homes, hospice and next-of-kin. Additionally the GCCR regional cancer coordinators conduct yearly casefinding audits on a sample of hospitals. During these audits cancer registrars check on missed cases in hospital departments of medical records, pathology, radiology, outpatient department, and other hospital sources.

Since 1995 all healthcare providers in the state of Georgia have been required to report specific information on all cancers in their patient population to the Georgia Comprehensive Cancer Registry. This includes all facilities providing diagnostic evaluations and/or treatment for cancer patients, including hospitals, outpatient surgical facilities, laboratories, radiation therapy and medical oncology facilities, and physician's offices. In addition, reporting agreements are maintained with neighbouring states so that Georgia residents who are diagnosed or treated in out-of-state facilities can be identified.

Use of the data

The registry prepares an annual report of cancer incidence and mortality, highlighting trends and changes. Special reports on breast, cervical, colorectal, lung, prostate, and childhood cancers are prepared on an annual basis. GCCR annual reports, cancer incidence and mortality analysis are available at http://health.state.ga.us/programs/gccr. Cancer data are analysed regularly to meet the needs of the state-wide Georgia Comprehensive Cancer Control Program. The GCCR provides qualified researchers with cancer data to assist in investigating their proposed studies, and responds to various data requests and cancer cluster for the public.

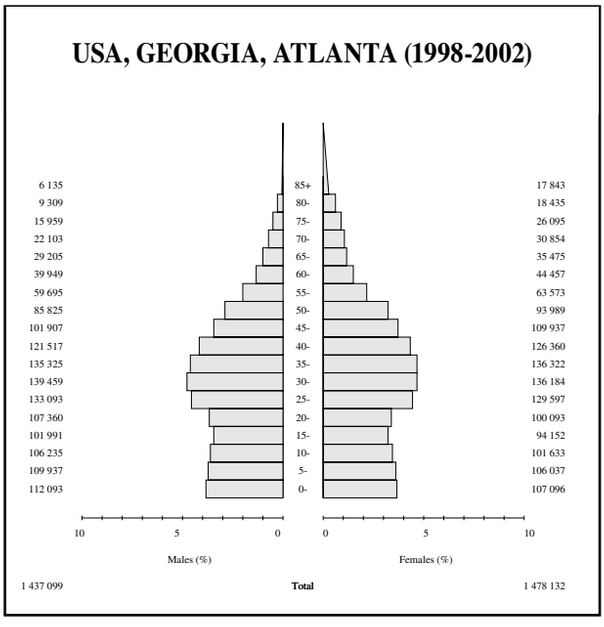
IACR rules (2004) on CI5 IX period.

USA, Georgia, Atlanta

Registration area

The Metropolitan Atlanta Registry records cancer diagnosed in residents of five contiguous counties (Clayton, Cobb, DeKalb, Fulton and Gwinnett) surrounding the state capital of Atlanta, Georgia. Covering an area of 4500 km^2, the metropolitan Atlanta area is situated in the southeastern United States at latitude 33º N and longitude 84º W. The population in 2000 was estimated to be 2 914 587, of which 54% were white, 36% were black, 4% were Asian and 6% were other races. Approximately 6% of the population were Hispanic. The combined population of these 5 metropolitan Atlanta counties comprised 36% of the entire population of Georgia (159 counties). The area has one of the fastest-growing populations in the USA, with an increase of 737 546 (33.8%) between 1990 and 2000. Atlanta lies at an altitude of over 320m and enjoys a temperate climate with 4 distinct seasons. Air pollution is a growing problem, particularly during summer months.



Registry structure and methods

The Georgia Center for Cancer Statistics (GCCS), a division of the Department of Epidemiology in the Rollins School of Public Health at Emory University, was founded in 1976 to provide population-based incidence data for a 5-county region in the southeastern USA as part of the National Cancer Institute's Surveillance, Epidemiology and End Results (SEER) Program. Metropolitan Atlanta was a logical choice, since it had been included in the First, Second and Third National Cancer Surveys. Since its inception the population covered by the registry has increased dramatically, but the geographical boundaries have not changed.

The GCCS also operates the Rural Georgia SEER Registry and carries out the day-to-day operations of the Georgia Comprehensive Cancer Registry. It collaborates with the SEER Program of the National Cancer Institute, the Cancer Control Program of the State of Georgia and the National Program of Cancer Registries at the Centers for Disease Control and Prevention on these cancer registry projects. The registry is staffed by over 25 full-time employees including epidemiologists, data abstractors, quality control editors, data analysts and other support staff.

Cancer is a reportable disease in the state of Georgia. The Metropolitan Atlanta Registry combines both active and passive case-finding and reporting systems. Most of the hospitals and free-standing pathology laboratories in the area identify and electronically transmit their cases to the registry on a monthly basis. Registry field staff actively identify and collect cases from radiation therapy facilities, large physician practices and other selected facilities without the ability to report data electronically.

Patient follow-up is primarily conducted through hospital cancer registries, treating physicians and record linkage against a variety of available data sources. Death certificates are obtained electronically on a monthly basis and are used to supplement case-finding and update patient follow-up. Data are processed at the registry using software developed by in-house staff. Extensive automated and visual editing is performed on the data to enhance and ensure quality. Both case-finding and re-abstraction audits are periodically performed at facilities reporting data.

Interpreting the results

The Metropolitan Atlanta Registry actively shares data with the Georgia Comprehensive Cancer Registry to help ensure complete case ascertainment and treatment information on residents of the 5-county catchment area diagnosed and/or treated elsewhere in Georgia. Case sharing agreements with Georgia's bordering states also exist. For selected cancers that may be solely diagnosed and treated in the physician's office setting, incidence records may be missing from the registry due to a general lack of reporting by physicians throughout the state.

Use of the data

The Metropolitan Atlanta Registry submits data on an annual basis to the National Cancer Institute's SEER Program and the Center for Disease Control and Prevention's National Program of Cancer Registries, in collaboration with the Georgia Comprehensive Cancer Registry. A number of population-based descriptive and analytical epidemiological investigations have been conducted through the registry. Several of these have focused on factors, which may relate to the observed high incidence and low survival rates for cancer among blacks. These studies have included cancers of the prostate, breast, pancreas, esophagus, ovary, colon, rectum and multiple myeloma. Registry data extensively support the research of faculty within the Rollins School of Public Health at Emory University as well as many other researchers throughout the state.

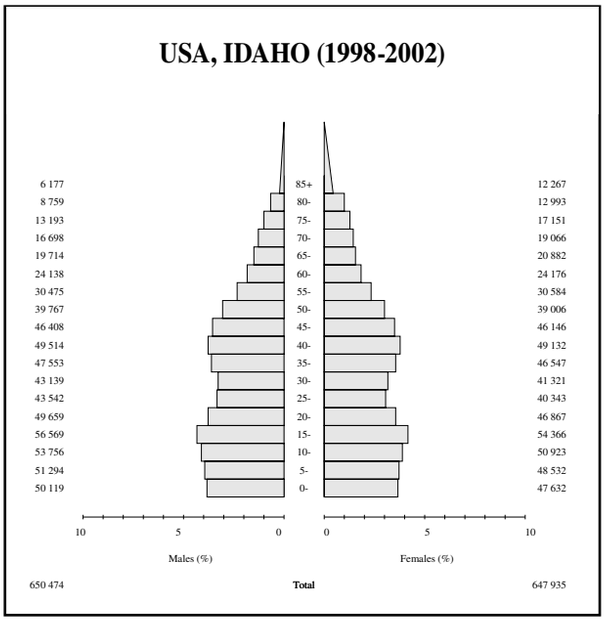
USA, Idaho

Registration area
According to the US Census Bureau (internet release 22 December 2006), Idaho's total resident population for 1 July 2006 was 1 466 465. Idaho is the 4th fastest growing state since the 2000 Census. Idaho ranks 3rd among the 50 states plus the District of Columbia in terms of the proportion of the population aged 18 and under, and 41st in terms of the proportion of the population aged 65 and older (2000 Census). The majority of Idahoans are non-Hispanic whites; Hispanics and Native Americans are the two largest minority groups, comprising 8.9% and 1.6% of Idaho's population, respectively (2004).

Idaho ranks near the bottom of states on several demographic measures that have been shown to be related to lower rates of cancer screening and later stage at diagnosis. Idaho is a large geographical state of 82 413 square miles, and over one third of Idaho counties are classified as frontier with less than 6.0 persons per square mile. The rural character of Idaho combined with severe winters in much of the state pose difficulties with access to cancer care.



Cancer care facilities
Thirty-seven hospitals routinely provide cancer diagnosis and/or treatment. There are seven hospitals in Idaho that have approved cancer programs from the American College of Surgeons Commission on Cancer. Seven hospitals offer radiotherapy, and there is one free-standing radiation facility in Idaho.

Registry structure and methods
The Cancer Data Registry of Idaho (CDRI) is a population-based, statewide cancer registry that collects incidence and survival data on all cancer patients who reside in the state of Idaho or who are diagnosed and/or treated for cancer in the state of Idaho. Idaho has one of the oldest cancer registries in the United States. Established before the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program, the Cancer Data Registry of Idaho (CDRI) has functioned since 1969 and has been population-based since 1971.

Since 1969, CDRI has been supported with state funding by a dedicated fund from a portion of Idaho's tobacco tax. Since 1994, CDRI has enhanced cancer registry operations and increased utilisation of cancer registry data with National Program of Cancer Registries (NPCR) funding administered by the US Centers for Disease Control and Prevention (Public Law 102-515).

CDRI is staffed by six employees, including a vice president of operations and registry services, a director, an epidemiologist, a database coordinator and two cancer data controllers.

Both hospital-based registrars and central registry personnel conduct active and passive follow-up of cancer patients. CDRI conducts an annual linkage with vital records to obtain survival data as well as determine cancer cases that were not identified through other sources.

CDRI has worked since 1999 with the Northwest Portland Area Indian Health Board (NPAIHB) on probabilistic linkages between cancer registry, tribal registry and Indian Health Service administrative data to improve the accuracy of cancer statistics among Native Americans in Idaho.

Interpreting the results
CDRI has achieved NPCR and North American Association of Central Cancer Registries (NAACCR) standards for data completeness, timeliness and quality since 1993; for the last ten years of submitted data (1995–2004) CDRI has achieved the NAACCR Gold Standard. Idaho data are included in USCS and CINA.

In 2004, Idaho was twelfth-worst in the nation for men aged 40 and older who have not had a prostate specific antigen (PSA) test within the past two years, according to the Behavioral Risk Factor Surveillance System (BRFSS).

Use of the data
CDRI data are used for many purposes, including surveillance of cancer incidence rates, program planning and evaluation, quality assurance, measurement against clinical guidelines and benchmarks, central registry systems development, responding to requests for information from hospitals, media and the public, and public health practice.

CDRI data are used in approved projects for use in epidemiologic and translational studies. In 2006 CDRI was funded to participate in the CDC/ORC Macro study "Accuracy of Cancer Mortality Measured by Death Certificates." CDRI worked with NPAIHB to link tribal registries to CDRI data to improve quality of race-specific incidence rates and used linked data in studies.

Published reports of cancer incidence and mortality are available on the CDRI web site at: www.idcancer.org.

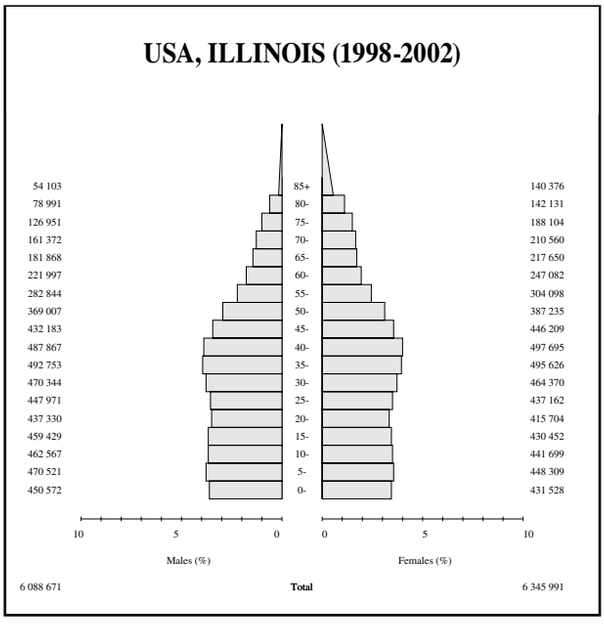
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Illinois

Registration area
The Illinois State Cancer Registry covers the population of the State of Illinois, USA. The population at the most recent census was 12 439 738, with an urban population of 12 378 679 and a rural population of 61 059. Eighty percent of the population is white, 16% African American, and 4% of the Illinois residents reported themselves as some other race; 12% of the population is Hispanic or Latino.

Cancer care facilities
Throughout Illinois cancer patients are treated at hospitals, ambulatory surgery centres, out-patient non-hospital facilities that house radiation therapy equipment, physician's offices and chemotherapy centres. The size of the hospitals varies from large teaching and university-based hospitals to small rural community hospitals. There are two NCI-designated Comprehensive Cancer Centers in Illinois. About 6% of the Illinois residents visit hospitals in other states for diagnosis and treatment.



Registry structure and methods
The Illinois State Cancer Registry is housed in the Illinois Department of Public Health, Division of Epidemiologic Studies and state law provides the authority for collection of cancer incidence cases.

The state accounts for one third of the Registry funding, and the other two thirds is funded by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). The registry receives reports from over 400 facilities, and 97% of the reports are received in electronic format. All hospitals are visited at least once every five years for casefinding. Re-abstracting studies will be performed online within the next year, and online abstracting will also be available. Death clearance is performed as a casefinding tool, and data exchange is performed with 12 other US states.

There are 23 staff supporting the registry and include a PhD, MD Medical Director, along with 11 certified tumour registrars (including registry manager, trainer and QC manager), 3 database support staff, 1 data use coordinator, 2 registry operations staff, 1.75 clerical support staff, 2.5 epidemiologists and 1.75 research support staff. The registry performs all activities required by the National Program of Cancer Registries and has been certified as a gold standard registry by the North American Association of Central Cancer Registries for the past 9 years.

Interpreting the results
The completeness of reporting for the Illinois State Cancer Registry is at estimated to be 100%. However, melanomatous cancers of the skin and prostate cancer are estimated to be under reported.

Use of the data
The registry provides yearly annual reports at the state and county levels; a public dataset file with data at state, county and postal code levels; an interactive query system of all public data on the Department's web site; access to confidential data by researchers through application and IRB review; cluster investigations; quality control reports to reporting facilities; linkage with the Department's Breast and Cervical cancer program and the State's death certificates and various non-confidential data requests from reporting facilities.

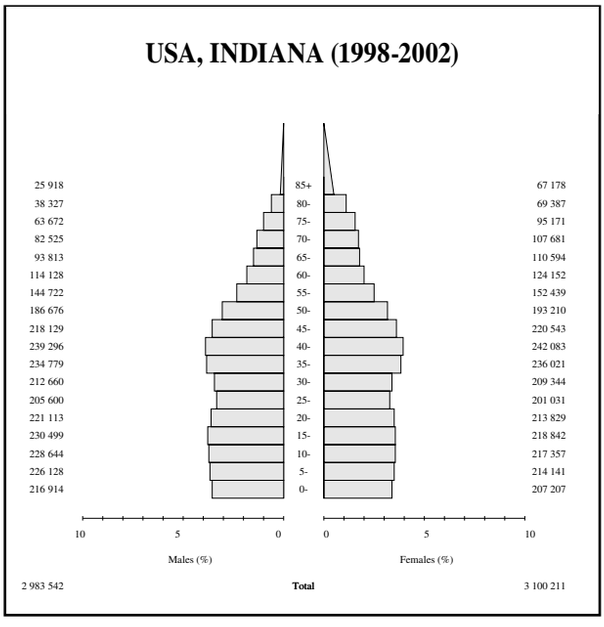
The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Indiana

Registration area

The Indiana State Cancer Registry covers the population in the state of Indiana, USA. The population at the most recent census (2000) was 6 080 485. The majority of the population (85.8%) is white, non-Hispanic. Non-Hispanic Black or African Americans comprise 8.3% of the population, Hispanics of any race 3.5%, and all other non-Hispanics 2.3%. The majority of the population (70.8%) resides in urban areas with 56.1% of the total population living in areas with more than 50 000 residents. Although 29.2% of the population lives in rural areas, only 2.1% of the total population live on farms. Surveys from 1990 suggest that about 87.5% of the population is Christian (Catholic 16%), about 7.4% is nonreligious, about 0.3–0.4% is Jewish, about 0.1% is Muslim, and the others belong to a variety of religions. Approximately 14% of the population has no health insurance, 24% has government-sponsored health insurance, and 63% has private health insurance (59% through their employers).



Cancer care facilities

Approximately 44 of the approximately 120 acute care hospitals in Indiana have a cancer program approved by the Commission on Cancer/ American College of Surgeons. Patients also receive cancer care in a variety of outpatient settings, such as ambulatory surgery centres, radiation therapy centres, cancer clinics, home care, private physician offices, and other locales.

Registry structure and methods

The registry is located within the Indiana State Department of Health, and is funded through state and federal funds from the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). The registry is staffed by a director, three full-time cancer registrars, one full-time software programmer/analyst, one grant coordinator, and one secretary.

The registry collects data from approximately 120 hospitals throughout the state plus additional surgery centres, radiation centres, pathology laboratories, and physician offices. Cancer registry records are matched electronically with death certificates every year. Unreported cancer cases identified through this death clearance process are followed back and added to the registry as either a new case or a Death Certificate Only (DCO) case.

Cancer is a reportable disease by state statute. Most cases are reported electronically by hospitals using various cancer registry software programs. Case-sharing agreements are in place with the four surrounding states (MI, OH, KY, & IL) and approximately 14 other states.

Numerous quality control procedures are performed on all incoming data using electronic and manual edit checking procedures.

Interpreting the results

Estimates of completeness of case ascertainment are made using the NAACCR method, which compares the ratio of incidence rates to mortality rates for over a dozen cancers, and compares this ratio with the ratio calculated for areas covered by SEER.

The Indiana State Department of Health (ISDH) has a Breast and Cervical Cancer Program through the Centers for Disease Control and Prevention (CDC), which provides funding and guidelines for the program. This program provides mammograms and Papanicolau testing for low-income women ages 40–65. The ISDH organizes the annual Black & Minority Health Fair, which occurs in conjunction with the Indiana Black Expo Summer Celebration. Free PSA testing is offered as one of a number of screening tests for chronic diseases. There is information available about screening for other cancers, including breast cancer, cervical cancer, and colon cancer, though these screenings are not generally offered at the fair. Outside of ISDH, there are many public and private organisations offering free or low-cost screenings for breast, cervical, prostate, and colon cancers.

Self-reported information from the 2004 Indiana Survey of the Behavioral Risk Factors Surveillance System indicates that an estimated 48.9% of Indiana men age 40 or above have had a PSA test within the past 2 years. This is lower than the nationwide (USA) average of 51.8%. In Indiana, only an estimated 55% of men age 40 or over report ever having had a PSA test.

Indiana is second highest in the USA in the percentage of current smokers (27.3% of the population age 18 or older). Both tobacco growing and coal mining are fairly common occupations in southern Indiana.

Use of the data

The Cancer Registry supports the Comprehensive Cancer Control program with data used both in educational publications and to provide an evidence base for the planning and implementation of strategies. The registry prepares an annual report of cancer incidence. Cancer registry data are also matched with data from the Breast and Cervical Cancer Early Detection Program annually. Cancer registry data are provided to the Shared Information Pathology Network project at Regenstrief Clinic in Indianapolis quarterly. Data are also used to respond to numerous unscheduled requests for data from other sources. Neither the registry nor any other programs or divisions in the ISDH does epidemiological cancer research beyond producing routine statistics. However, the Indiana State Cancer Registry makes its data available to bona fide researchers in both public and private organisations.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

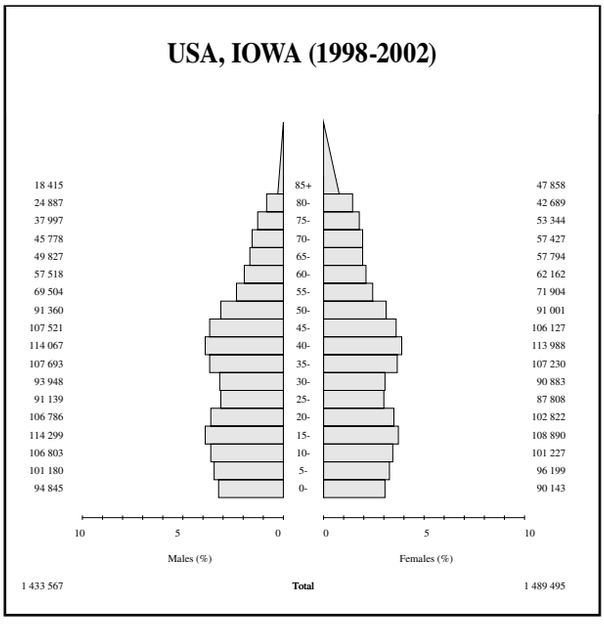
USA, Iowa

Registration area

The state of Iowa is located near the geographical middle of the United States and is part of its agricultural "heartland". Iowa is bordered on the north by Minnesota, the south by Missouri, the east by Illinois, and the west by Nebraska. The total area is about 145 800 km^2 with elevation ranging between 146 and 505m above sea level.

Ninety-two percent of the land area in the state is devoted to agriculture, ranking the highest in the USA among its 50 states. Agricultural exposures include pesticides, fertilizers, fuels and oils, animal viruses, organic solvents, engine exhausts and paints. These may influence cancer incidence in this population, but likely not as strongly as lifestyle factors like tobacco use, alcohol consumption and overweight/ physical inactivity.

Iowa had a 2000 population of 2 926 324, a 3.6% increase over its 1970 population. The population aged 65 years and older increased from 12.4% in 1970 to 14.9% in 2000. The principal ethnic group is Northern European, with Germans, Danes and Swedes accounting for a large segment of the population. The 2000 population is 93.9% white with 2.1% blacks, 1.3% Asian/Pacific Islander, 0.3% American Indian/Alaskan Native, and 2.4% other or more than one race. Over 80% of Iowa residents are native-born. The population is primarily Christian, the most prevalent religions being Roman Catholic, Lutheran, and Methodist.



Cancer diagnostic and treatment services are widely available to the entire Iowa population through both in-state and out-of-state facilities. These include surgery, radiation therapy, chemotherapy, and other treatment modalities such as immunotherapy. Radiation oncology services are provided as in-hospital facilities as well as stand-alone facilities. These types of diagnostic and treatment services have increased over time and have been accompanied by increasing numbers of medical, surgical, and radiation oncologists.

Registry structure and methods

Cancer data collection for the entire state of Iowa began in 1969 with the Third National Cancer Survey sponsored by the National Cancer Institute (NCI). With the completion of the survey in 1971, no further funding for cancer registration was available and 1972 data are incomplete. In 1973 the State Health Registry of Iowa, frequently referred to as the Iowa Cancer Registry, became part of the NCI Surveillance, Epidemiology and End Results (SEER) Program. The area covered by the Registry has not changed since 1969, and includes all 99 counties in the state of Iowa.

Cancer became a reportable disease in Iowa in 1982. The Iowa Department of Public Health has designated responsibility for cancer data collection to the Registry. Cancer data for Iowa residents are obtained from 154 hospitals, clinics, and pathology laboratories located both within the state and bordering the state. Cancer data are exchanged with other states.

Data are collected by Hospital Cancer Registrars and by 20 field staff employed by the Registry to cover specified geographic areas. The field personnel visit hospitals and other facilities in their areas and abstract data using laptop computers. The Registry's remaining 30 full-time employees work in the central office where they edit the data, consolidate multiple reports for the same cancer, perform follow-up, respond to data requests, and conduct research.

Since 1969, there have been changes in case definition and coding. These are documented in revisions to coding manuals and extent of disease classifications, provided at http://www.seer.cancer.gov/tools/codingmanuals.

The International Classification of Disease for Oncology is used to assign codes for topology, morphology, and tumour behaviour. The Registry is currently using the 3rd edition of ICD-O.

The Registry uses active and passive follow-up activities to obtain survival data. Passive follow-up activities include computerized linkage of data with death certificate information, driver's license files from the Iowa Department of Transportation, the Social Security Administration Epidemiological Vital Status data, and Medicare information provided by the Centers for Medicare & Medicaid Services. Active patient follow-up is conducted annually.

Quality control activities, including computer edits, statistical comparisons, and visual review of data, occur daily. Site-specific re-casefinding and re-abstracting are also performed on a regular basis.

Interpreting the results

Although some Iowans who leave the state for care are not identified and missed, ascertainment is thought to be about 99%. The Iowa Cancer Registry successfully follows over 98% of all patients into the current year.

Use of the data

The Registry functions as a collaborative program with the Iowa Department of Public Health. Many University of Iowa researchers have used Registry data. Registry data have also been used extensively in a number of local, national and international epidemiological studies.

Policymakers look to the cancer registry to provide information regarding the burden of cancer and time trends in cancer incidence, stage of disease at diagnosis, survival, and mortality. To this extent, they are currently used to address and assess cancer prevention and control issues. Occasionally, the data are also used to determine certificate

of need requests for new medical facilities and equipment in selected geographic areas of the state.

Source of population
Annual census projection based on the 2000 Census, prepared by the US Bureau of the Census.

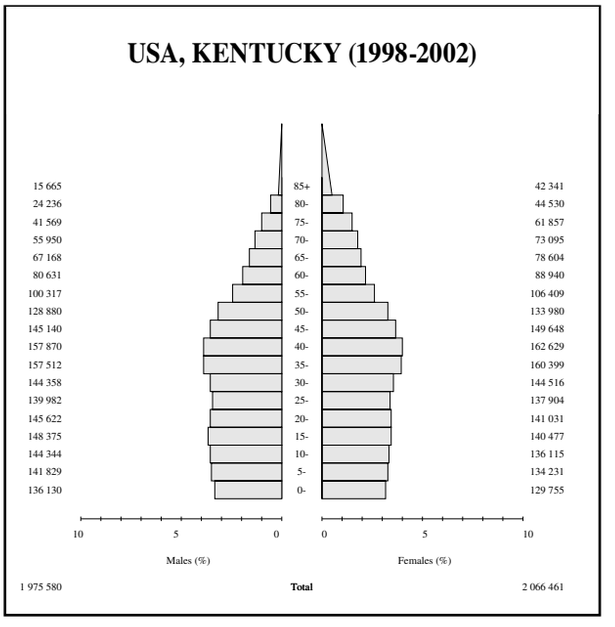
IACR rules (2004) on CI5 IX period.

Notes on the data
C44 does not include basal cell or squamous cell carcinoma.

USA, Kentucky

Registration area
The Kentucky Cancer Registry (KCR) is a population-based central cancer registry for the entire state of Kentucky. According to the 2000 U.S. Census, the population of Kentucky was approximately 4 042 000. Of that, 75.1% are White, 12.3% are Black and the remaining 12.6% are American Indians, Alaska Natives, Asian, Hawaiian Natives, Pacific Islanders or other races.

Cancer care facilities
All health care facilities in Kentucky that diagnose or treat cancer patients are required to report cancer cases to KCR. Facilities that are also required to report cancer cases include freestanding treatment centres, non-hospital (private) pathology laboratories, and physician offices.



Registry structure and methods
KCR has been collecting data on incident cases of cancer since 1991, when the State General Assembly approved legislation requiring mandatory reporting of all cases of cancer to the registry. The legislation provided recurring funding for staff, travel and computer equipment. KCR also receives funding from the US Centers for Disease Control and Prevention (CDC) through the National Program of Cancer Registries (NPCR) and the National Cancer Institute's Surveillance Epidemiology and End Results (SEER) program. KCR employs three Regional Coordinators to work with larger institutions and four Regional Abstractors that work with smaller hospitals in order to ensure the quality, accuracy, timeliness of the data reported.

The larger hospitals (those diagnosing or treating more than 100 new primary cancer cases annually) are required to have their own tumour registrar(s). These larger hospitals are divided into three geographic regions. The three Regional Coordinators employed by KCR spend one day each month in each of these larger facilities providing additional training, re-abstracting cases for quality control and helping the hospital-based registrars prepare reports from the data. The smaller hospitals (those diagnosing or treating fewer than 100 new primary cancer cases annually) are divided into four regions and assigned to one of four Regional Abstractors employed by KCR. The Regional Abstractors record and report information on all cases of cancer seen in these smaller institutions. The KCR Regional Coordinators and Regional Abstractors are required to be Certified Tumor Registrars (CTRs) or become CTRs within two years of their date of employment.

Interpreting the results
Data from KCR have been submitted to the North American Association of Central Cancer Registries (NAACCR) for an objective evaluation of completeness, accuracy and timeliness each year since a formal certification program was established in 1997. In each year (1999–2001), KCR received the highest level of NAACCR certification available (Gold). KCR has also submitted its data for inclusion in the Cancer in North America (CINA) publication. A registry must have complete data for the most current five-year period before their data can be evaluated for inclusion in the CINA combined rates. KCR data have been included in the CINA combined rates each year since five years of KCR data became available.

Use of the data
KCR data are used to initiate cancer control programs, evaluate intervention activities, or conduct epidemiological research. KCR data have been used in preparing hundreds of research projects and proposals. Also, data from KCR are presented each year to cancer councils in 15 Area Development Districts (groups of counties) covering the entire state. These District Cancer Councils use the data from KCR to identify specific types of cancer that occur in their area at substantially different rates compared to state and US rates.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census.

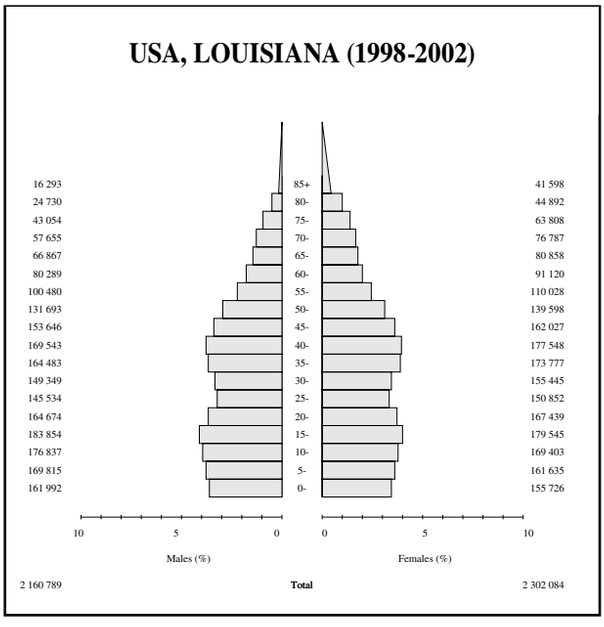
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Louisiana

Registration area

Louisiana belongs to what is historically known as the "Deep South" of the US, a warm and flat section of the country. The 2000 Louisiana population of 4 468 976 is 63.9% white and 32.5% African-American. Louisiana has less racial diversity than the nation, with 1.2% Asians, 2.4% Latin Americans, and 2.6% foreign-born. One population group unique to the state is the Cajuns, descendants of French-Canadians who live in central and southwest Louisiana.

Per-capita income and graduation rates for high school and college well below the national levels reflect Louisiana's low socioeconomic ranking in the US. The percentage living below the poverty level is 50% higher in Louisiana than nationally. Louisiana is unusual, however, in its dedication to providing free medical care through a statewide system of ten public hospitals.



Cancer care facilities

During the years 1998–2002 cancer diagnostic care and treatment were available at approximately 125 inpatient hospitals in Louisiana. The cancer programs at 29 hospitals and one cancer treatment centre were accredited by the Commission on Cancer. Radiotherapy services were available at most of these facilities, located in the larger cities throughout the state. One notable change in medical practice has been the rise of freestanding outpatient surgery facilities. Only a handful existed in Louisiana in 1998–2002, but two dozen are open now.

Registry structure and methods

The Louisiana Tumor Registry (LTR) was established in 1974 to monitor cancer incidence in the three-county area of Greater New Orleans. Its catchment area gradually expanded to include the entire state by 1988. The LTR participates in both the US Centers for Disease Control and Prevention's National Program of Cancer Registries and the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program.

The LTR comprises a central office and eight regional offices. The LSU Health Sciences Center operates the LTR central office and three of the regional offices while local academic and medical organisations with cancer research and treatment interests coordinate the activities of the remaining five regions.

The registry staff in early 2005 numbered 54, with 18 of those in the central office. The LTR staff included 23 Certified Tumor Registrars, and the central office, housed in the Louisiana State University in New Orleans, had a research/technical team that included 4 doctorate degrees and 6 Master's degrees.

Louisiana law requires all licensed healthcare providers to report cancer cases who receive medical services for cancer. Because the LTR is considered a public health authority, it is exempt from the patient consent requirement of the HIPAA legislation.

Most incident cases are identified in hospitals. One fourth of the hospitals in Louisiana operate cancer registries, and these report about two thirds of new cases. Registrars from the LTR regional offices screen and abstract at the remaining hospitals. The LTR follows the reportability guidelines of the SEER Program and the CDC National Program of Cancer Registries andthe coding guidelines of the SEER Program.

Non-hospital sources of reportable cancer cases include pathology laboratories, radiation and dermatology clinics, and one-day surgery facilities. Pathology reports from both hospital and freestanding laboratories, including out-of-state labs, are screened, and all positive reports are followed back to the diagnosing healthcare provider to obtain the required information. Death certificates also identify a small number of cases, and these too are followed back to the diagnosing physician or hospital if possible.

Industry in Louisiana

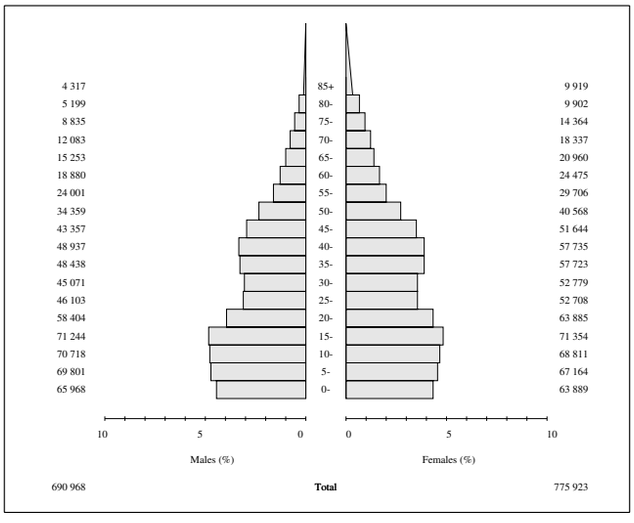
Although the state's economy traditionally relied on agriculture, Louisiana is now the second-largest refiner of petroleum in the US, and manufactures a quarter of the nation's petrochemicals. Over 25 000 people are employed in chemical manufacturing and another 14 000 in shipbuilding. The presence of 100 large petrochemical facilities has given rise to concerns about excess cancer incidence among workers and residents there. The LTR publishes comparisons of cancer incidence rates in the industrial corridor from Baton Rouge to New Orleans with those for the state and the nation in its annual *Cancer in Louisiana* series. Although monitoring environmental indicators remains the responsibility of the federal Environmental Protection Agency and the state Department of Environmental Quality, the LTR collaborates with the Louisiana Office of Public Health in investigating reports of excess cancer incidence in specific areas.

Use of the data

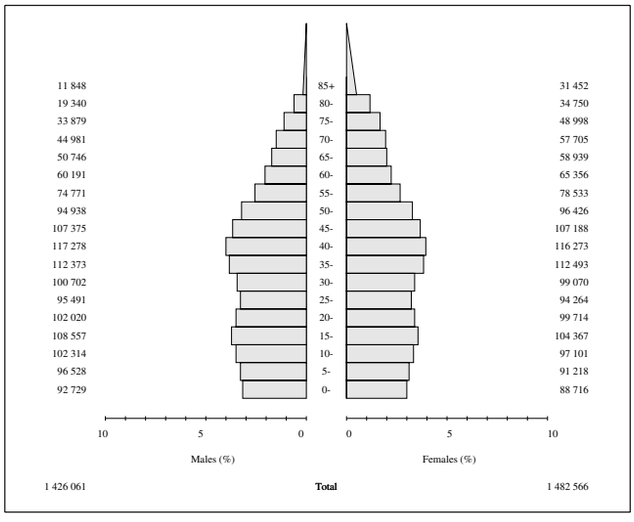
Louisiana incidence and mortality data are published annually in *Cancer in Louisiana* and are available on the registry website: http://publichealth.lsuhsc.edu/tumorregistry. In addition, they are incorporated into several databases on the Web: the CDC/NCI's State Cancer Profiles, the CDC's WONDER, and the North American Association of Central Cancer Registries' CINA+. The LTR cooperates with outside researchers investigating the correlations between

cancer incidence and workplace exposures or lifestyle risk factors and with the Louisiana Office of Public Health in investigations of potential cancer "clusters." LTR staff members also participate in patterns-of-care studies for the CDC and the SEER Program, as well as publishing numerous descriptive epidemiology articles.

USA, LOUISIANA: BLACK (1998-2002)



USA, LOUISIANA: WHITE (1998-2002)



Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Louisiana, New Orleans

Registration area

The New Orleans region, comprising three counties in southeast Louisiana in the American Deep South, had a population of 1 007 369 in 2000. Of these, 99% were considered urban dwellers. The average per capita income of metropolitan New Orleans was slightly higher than the state average, but the state per capita income is 22% lower than the national level. The area's population is approximately 44% African American and 53% white, with only a small presence of Asians or American Indians. About 5% of the population is of Hispanic origin.

Cancer care facilities

Cancer registration in the three-county area of Greater New Orleans began in 1974. The New Orleans Regional Registry, which also documents cancer incidence in eight surrounding counties, has a staff of six full-time employees and a supervisor. Of these, five are Certified Tumor Registrars.

Diagnosis and treatment for cancer during the period 1998-2002 was available at 18 hospitals in Greater New Orleans. Eight offered cancer programs approved by the Commission on Cancer, and a few others had extensive cancer services as well. Radiotherapy was available only at these large facilities.

Registry structure and methods

Although the Louisiana Tumor Registry (LTR) encompassed only the New Orleans area in 1974, its catchment area expanded incrementally, covering the entire state in 1988. The LTR participates in both the U.S. Centers for Disease Control and Prevention's National Program of Cancer Registries and the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program.

The LTR comprises a central office and eight regional offices. The LSU Health Sciences Center operates the LTR central office and three of the regional offices, while local academic and medical organizations with cancer research and treatment interests coordinate the activities of the remaining five regions.

Louisiana law requires all licensed healthcare providers to report cases that receive medical services for cancer, whether a resident of the state or not. Because the LTR is considered a public health authority, it is exempt from the patient consent requirement of the HIPAA legislation.

Most incident cases are identified in hospitals. One fourth of the hospitals in Louisiana operate cancer registries, and these report about two thirds of the new cases. Registrars from the LTR regional offices screen and abstract at the remaining hospitals. The LTR follows the reportability guidelines of the SEER Program and the CDC National Program of Cancer Registries, abstracting all data items required by these programs as well as other data items.

Non-hospital sources of reportable cancer cases include pathology laboratories, radiation and dermatology clinics, and one-day surgery facilities. Pathology reports from both hospital and freestanding laboratories, including out-of-state labs, are screened, and all positive reports are followed back to the diagnosing healthcare provider to obtain the required information. Death certificates also identify a small number of cases, and these too are followed back to the diagnosing physician or hospital.

For cancer cases diagnosed in its area, each regional office abstracts, consolidates, and edits data and documents survival through active follow-up. The central office consolidates and edits data from the regional registries, monitors completeness of case ascertainment, exchanges case reports with other states, obtains survival information through data linkages, and analyzes and interprets the statistical information derived from the data.

Both regional registries and the central office evaluate case completeness on an ongoing basis by comparing each facility's case counts with those for previous years. The LTR conducts case-finding audits throughout the state, as do the major funding agencies (the CDC and the SEER Program). Abstractors from the central and regional offices participate in national reliability studies at least biennially to evaluate their coding expertise, and samples of cases prepared by hospital registrars are re-abstracted to appraise their accuracy.

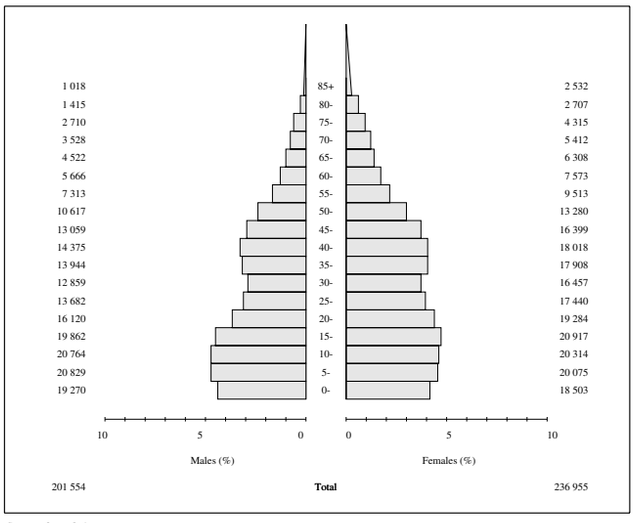
The LTR follows the coding guidelines of the SEER Program. Over time, some changes have been adopted nationwide to reflect changes in the understanding of cancer and in treatment modalities. These include the transition from the First Edition to the Third Edition of the ICD-O manuals and from the SEER 1977 staging manual to the SEER 2000 staging manual, as well as updates to the treatment codes.

Use of the data

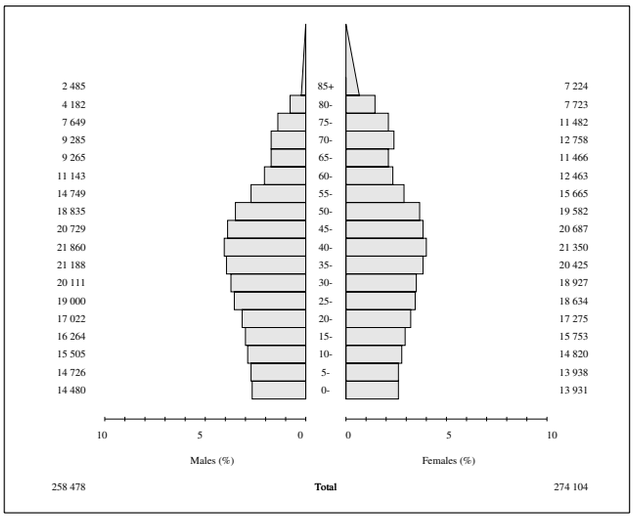
Louisiana incidence and mortality data are published annually in the LTR's *Cancer in Louisiana* series and are available on the registry website: http://publichealth.lsuhsc.edu/tumorregistry. In addition they are incorporated into several databases on the Web: the CDC/NCI's State Cancer Profiles, the CDC's WONDER, and the North American Association of Central Cancer Registries' CINA+.

The LTR cooperates with outside researchers studying correlations between cancer incidence and workplace exposures or lifestyle risk factors, and with the Louisiana Office of Public Health in investigations of areas with possible high rates of cancer incidence. In addition, LTR staff participates actively in patterns-of-care studies for the CDC and the SEER Program, as well as publishing numerous descriptive epidemiology articles.

USA, LOUISIANA, NEW ORLEANS: BLACK (1998-2002)



USA, LOUISIANA, NEW ORLEANS: WHITE (1998-2002)



Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census.

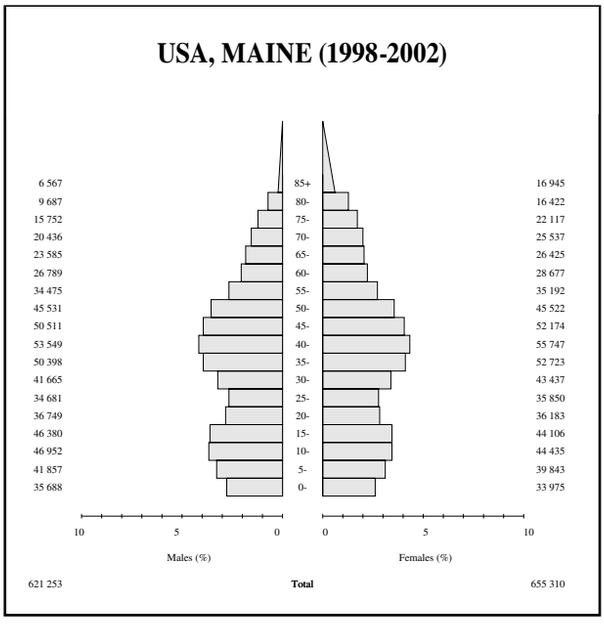
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Maine

Registration area
The Maine Cancer Registry covers the entire population of the state of Maine in the United States of America. According to the 2000 US Census, 58% of the population lives in a rural area. About 82% are Christian, while 17 % classify themselves as non-religious. About 97% of the population is Caucasian.

Cancer care facilities
Health care in Maine is provided by 37 hospitals and many private physician offices. Of the 37 hospitals, 11 have approved cancer care programs. The availability of care is more prominent in the more populous southern regions of Maine. Citizens in northern Maine may have to drive further to obtain appropriate cancer care.

Registry structure and methods
The registry is located in Augusta, the state capital. The registry is staffed by 6.5 full-time employees, two of whom are certified tumour registrars. Funding for the central registry is a 3:1 match between federal dollars from the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and state dollars. Cancer is a reportable disease according to state law. The majority of our cases are reported by hospitals on a routine basis. These data are supplemented by required physician reporting, active case-finding at Maine's one independent pathology laboratory, and review of death certificates with a mention of cancer. Death registry information in Maine is very complete and accessible. Maine also has data exchange agreements with all bordering states and other states where Maine residents tend to vacation during the winter. The Maine Cancer Registry has a quality control program, and the resulting data meet the highest standards for data quality.



Interpreting the results
Maine's cancer incidence database meets the highest standards for quality, completeness, and timeliness. The registry database is 100% complete for the data years of interest. Screening for prostate, colon, breast, and cervical cancer have increased but remain largely opportunistic. Environmental concerns in Maine include high levels of arsenic in private well water, and high radon air concentrations in Maine homes, as these chemicals occur naturally in Maine's geography. Maine is also home to a shipbuilding company that used asbestos in the past.

Use of the data
The registry prepares an annual report of cancer incidence and includes mortality from the state's vital statistics office. Annual reports may also include information on trends and stage at diagnosis. Maine does not operate a follow-up registry, so survival studies are not produced. Data are used for program planning and evaluation. Maine's database has also been used in special studies of bladder cancer, cervical cancer, colon cancer treatment, and quality-of-life surveys.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

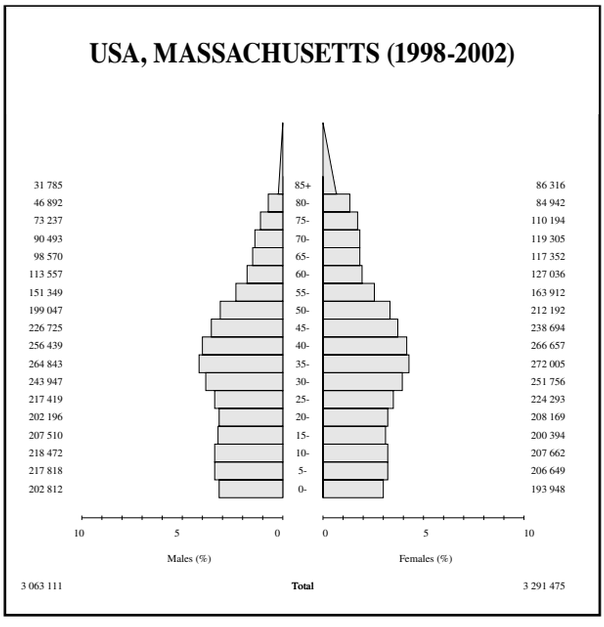
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Massachusetts

Registration area
The Massachusetts Cancer Registry (MCR) covers the population of the Commonwealth of Massachusetts. The population at the most recent US Census (2000) was 6 349 097. The population is represented as follows: 84% White non-Hispanic; 5% Black non-Hispanic; 7% Hispanic; 4% Asian non-Hispanic; .02% Native American non-Hispanic.

Cancer care facilities
The MCR collects reports of newly diagnosed cancer cases from multiple sources. In 2003, 70 Massachusetts acute care hospitals, 3 medical practice associations, 5 laboratories, 1 radiation/oncology facility, dermatologists and urologists reported to the MCR.

Registry structure and methods
The MCR is located within the Center for Health Information, Statistics, Research and Evaluation (CHISRE), Massachusetts Department of Public Health (DPH). The MCR is 75% funded by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR), and 25% by the Commonwealth of Massachusetts. The Registry's staff include a director, assistant director of registry operations, an administrative assistant, 9 operations staff (quality assurance and data acquisition), 3 epidemiology staff, and 3 geographic information systems/special project staff.



The MCR follows all CDC/NPCR program requirements for data collection and reporting. We are certified by the North American Association for Central Cancer Registries (NAACCR) and have received their gold standard for completeness, quality and timeliness for the past several years.

Interpreting the results
As noted above, the MCR collects reports of newly diagnosed cancer cases from multiple sources, including acute care hospitals, medical practice associations, laboratories, radiation/oncology facilities, dermatologists and urologists reported to the MCR. Reports from dermatologists' offices and dermatopathology laboratories, particularly on cases of melanoma, have only been collected by the MCR since 2001. Reports from urologists' offices have only been collected by the MCR since 2002. Currently, the MCR collects information on *in situ* and invasive cancers and benign tumors of the brain and associated tissues. The MCR does not collect information on basal and squamous cell carcinomas of the skin.

The MCR also collects information from reporting hospitals on cases diagnosed and treated in staff physician offices when this information is available. Not all hospitals report this type of case, however, and some hospitals report such cases as if the patients had been diagnosed and treated by the hospital directly. Collecting this type of data makes the MCR's overall case ascertainment more complete. The cancer types most often reported to the MCR in this manner are prostate cancer and melanoma.

In addition, the MCR identifies previously unreported cancer cases through death certificate clearance to further improve case completeness. When possible, the MCR obtains additional information on these cases through follow-up activities with hospitals, nursing homes and physicians' offices. Otherwise, a cancer-related cause of death recorded on a Massachusetts death certificate is the only source of information for a cancer case. As a result, these cancer cases identified through death certificates are poorly documented and have not been confirmed by review of complete clinical information. These cases, however, comprise less than 3% of all cancer cases in this report.

There are organised screening programs at the state level for breast, cervical and prostate cancer. According to data from the behavioural risk factor survey (BRFS), a questionnaire administered randomly to the state, 57.9% of men over 50 had a prostate specific antigen PSA in the past year. Additionally, 65.4% of men over 50 had a digital rectal exam (DRE).

Use of the data
The MCR produces two annual reports: *Cancer Incidence and Mortality in Massachusetts* (providing information on cancer incidence and mortality for the state as a whole), and *Cancer Incidence in Massachusetts: City and Town Supplement* (providing information on cancer incidence for Massachusetts' 351 cities and towns). We also produce special reports on a periodic basis, such as *Data Report on In Situ Breast Cancer in Massachusetts*, *Data Report on Colorectal Cancer in Massachusetts*, *Childhood Cancer in Massachusetts, 1990–1999*, *Cancer in Massachusetts Women, 1989–1998: Data Report*, and *Selected Cancers in Massachusetts Men, 1982–1996*.

Data are available to the public via MassCHIP, the MDPH's online information service that provides community-level data (http://masschip.state.ma.us), and at Massachusetts Cancer Information Online, a website that allows users to access a variety of local, state and national cancer information in three ways—by age, by geography and by type of cancer (http://www.mass.gov/dph/cancer). MCR reports are also posted on the program website (http://www.mass.gov/dph/bhsre/mcr).

The MCR receives approximately 10–15 requests for data each month. Data are used by other DPH programs for

program planning and evaluation, and by external researchers for epidemiologic studies. MCR staff provide support and consultation to other DPH programs and outside agencies.

USA, Michigan

Registration area
This Registry covers the State of Michigan within the United States of America. The state of Michigan is approximately 82% white, 12% black, 4% Asian and 2% Native American. The state is roughly 3% Hispanic.

Cancer care facilities
Diagnostic and treatment services for cancer are widely available throughout the state. Radiotherapy services are widespread and generally readily available in population centres, with some access issues in rural areas.

Registry structure and methods
The registry is located within the Department of Community Health for the State of Michigan. It is staffed using 12 full time equivalent positions. The registry is funded in part by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR).

Data collection is passive, with routine auditing of reporting by health facilities using CTRs.

Eighty-five percent of case reports are submitted electronically. Reports are received largely from hospitals and regional cancer registries. Reporting is supplemented by pathology laboratories, clinics, physicians and dentists. Resident case exchange agreements are in place with 19 other states.

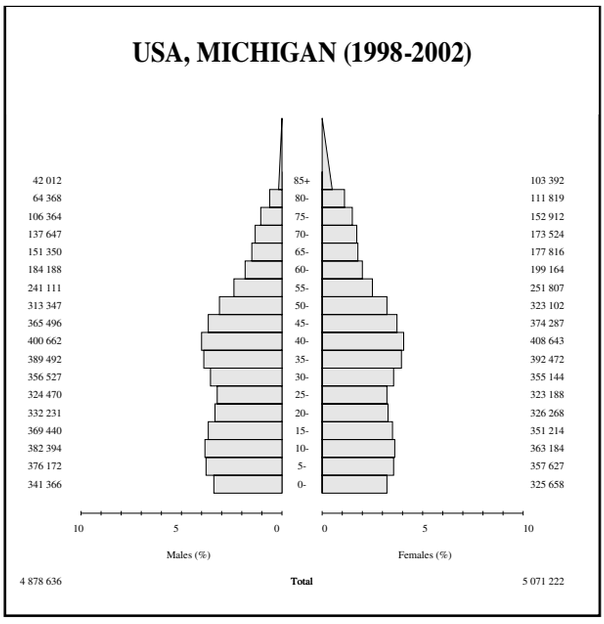
The registry is located within the vital records office with ready access to death information.

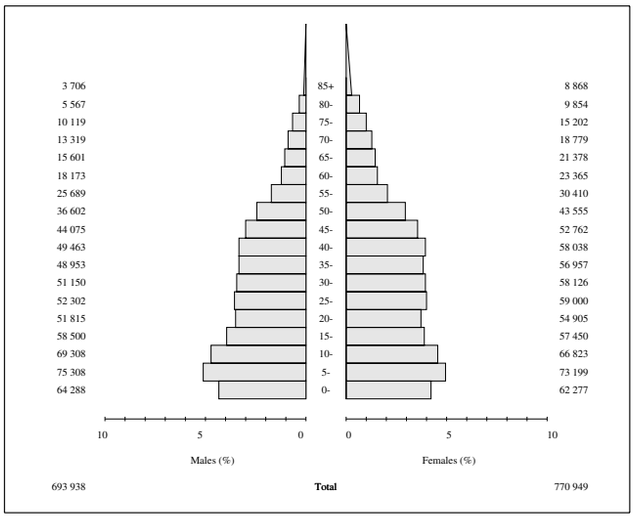
Reporting is required by law. Case information is confidential and protected by law. Improper use or release of the information is a crime.

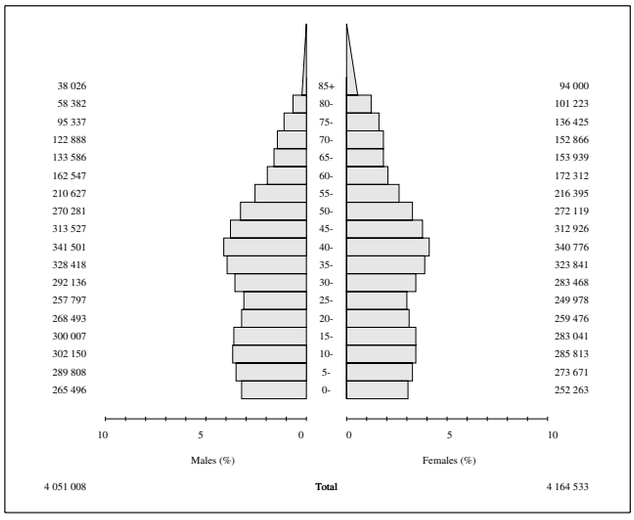
Registry quality, completeness, accuracy and timeliness are monitored through ongoing routine auditing of reporting facilities, with independent assessments of quality conducted annually by NAACCR and by CDC.

Interpreting the results
Breast and cervical cancer screening programs for the uninsured are in place throughout the state. Screening prevalence for breast and cervical cancer is reasonably high by US standards, and PSA testing is common in the population.

Use of the data
Registry data are used for reporting incidence, extent of disease, and survival. Data are also used in research, and for planning and evaluation of heath services.







Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. Multiple primary rules used
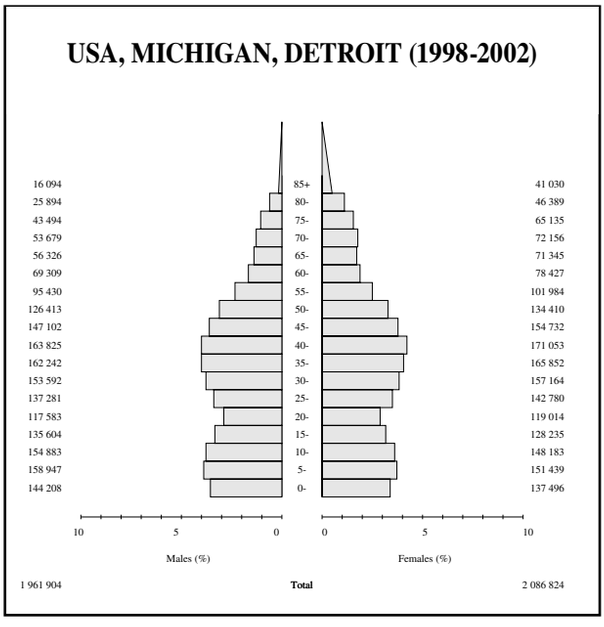
IACR rules (2004) on CI5 IX period.

USA, Michigan, Detroit

Registration area

The Metropolitan Detroit Cancer Surveillance System (MDCSS) covers three adjacent counties in southeastern Michigan in the United States (US) of America. Metropolitan Detroit is between longitudes 82º and 83º W and latitudes 42º and 43º N. These three counties, Wayne, Oakland and Macomb, comprise 42% of the overall population of the state of Michigan. The total population of the Metropolitan Detroit area, according to the 2000 US Census was 4 043 467. Of this total, 2 784 071 (68.8%) persons were Caucasian and 1 011 038 (25.0%) persons were African American. Of the total population, 118 641 (2.9%) persons were of Hispanic origin. The City of Detroit is the major urban centre of this area. In the City of Detroit, 12.3% of the population was Caucasian and 81.6% was African-American, with 5.0% of the total being of Hispanic descent. The Metropolitan Detroit area is culturally diverse, with representation from Arabic, Polish, Greek, Italian, German, English, Irish and Scottish ancestry. The area is heavily industrialised, being the centre of the United States automobile manufacturing industry. The total registration area is 5094 km^2.



Cancer care facilities

The MDCSS began in 1949 as a pathology registry for 25 collaborating hospitals. In 1960, the MDCSS became a central statistical resource for these 25 hospitals, providing reports comparing the experience of each hospital with the entire group of collaborating hospitals. In 1969 the MDCSS became the designated arm of the Michigan Department of Community Health (MDCH) for collection of cancer information in the Metropolitan Detroit area. In this same year, the MDCSS was organised in its current form to participate in the Third National Cancer Survey for the years 1969–1971. In 1973 the MDCSS became one of the founding participants in the National Cancer Institute's (NCI) Surveillance, Epidemiology and End Results (SEER) Program.

Registry structure and methods

In 1976, the MCF became a member of the NCI-funded Comprehensive Cancer Center in Detroit along with Wayne State University (WSU) and the Detroit Medical Center. In 1995, all programs of the Comprehensive Cancer Center were consolidated under the name of the Barbara Ann Karmanos Cancer Institute (KCI). The Director of KCI reports to the Dean of the WSU School of Medicine and the Comprehensive Cancer Center's Programs are administered by the School of Medicine.

We have a staff of 35 in abstracting, 14 in editing, 5 in follow-up and 4 in IT who handle case finding, abstracting, editing, follow-up and computer issues. In addition, there are over 40 individuals working in research.

The MDCSS provides both incidence and survival reporting for the Metropolitan Detroit area. Data are collected by the MDCSS abstracting staff from area hospitals, private pathology laboratories, radiation therapy facilities and selected clinics and physician offices. These facilities include those located within Metropolitan Detroit, as well as facilities outside the area, which routinely provide care for cancer patients who reside in the MDCSS registration area. Both passive and active follow-up are maintained for all cases. Re-admissions to hospitals are also abstracted for follow-up data. Death certificates for the State of Michigan, and for other states that are primary retirement areas for local residents, are linked by computer tape each quarter to provide up-to-date information on new deaths and causes of death.

The completeness and accuracy of our data are evaluated both by the SEER program and internally on a routine basis. The Metropolitan Detroit Cancer Surveillance System routinely scores in the top 5 of all SEER registries nationally.

Interpreting the results

Besides the metropolitan Detroit area being highly industrialised, the area is also home to a plant that was involved in the processing of vermiculite contaminated with asbestos.

Use of the data

From 1973 through 1978, the MDCSS and the Metropolitan Detroit SEER Program were essentially data collection operations, with minimal reporting of descriptive data. Development of a research program in cancer epidemiology began in 1979. Cancer epidemiology evolved into a major research program with a current focus on racial disparities in risk and survival. The Metropolitan Detroit SEER data are utilised extensively for descriptive and analytic epidemiology. The data are also utilised by local health departments, the Michigan Department of Community Health and area health professionals for planning, evaluation and educational purposes. Community concerns regarding cancer risk are also addressed through use of MDCSS data.

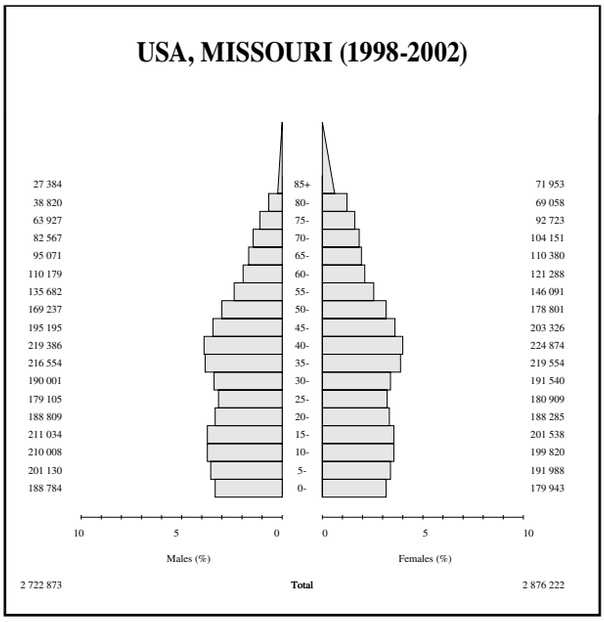
Multiple primary rules used

IACR rules (2004) on CI5 IX period.

USA, Missouri

Registration area
The Missouri Cancer Registry (MCR) covers the population of the state of Missouri, located in the middle of the United States and having as its eastern border the Mississippi River. The majority of Missouri's 5.5 million people live in two major metropolitan areas (Kansas City and St. Louis) and five minor metropolitan areas. The remainder of the state consists of small towns and rural areas.

Cancer care facilities
Over 85% of annual cancer incidence cases are reported by hospitals, of which there are 126 in Missouri, including four Veterans Affairs (VA) hospitals and two military hospitals. Most of the remaining cases are reported by long-term care facilities, ambulatory surgery centres, freestanding cancer clinics and treatment centres, pathology laboratories and physician offices/groups that diagnose or treat cancer or through case-sharing agreements with 18 other states. The states of Kansas, Illinois and Texas contribute the largest number of data exchange cases.



Registry structure and methods
MCR is a joint endeavour of the University of Missouri and the Missouri Department of Health and Senior Services (DHSS). It is located on the campus of the University of Missouri-Columbia and is housed in the School of Medicine, Department of Health Management and Informatics (HMI). The primary funding source for operating the registry is the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) through a contract between the University and DHSS. The registry's operations director is also a member of the HMI faculty. Registry staff include 9.25 Certified Tumor Registrars (CTR's), 3 health program specialists or assistants, 2.25 technical staff (data base manager and IT support), a half-time statistician, 1 support staff and 2 part-time graduate research assistants. The registry also receives support from four DHSS staff members who are partly funded by CDC-NPCR.

Data collection from hospitals is 80–85% automated. Approximately 5% of the cases are received as copies of medical records, which are then abstracted by MCR staff. Another 5% are submitted by non-hospital facilities (surgery centres, radiation centres, physician offices and nursing homes); most of these cases are submitted on paper but MCR is piloting web-based reporting of prostate cancer and melanoma skin cancer by physician offices. Another source is death certificates. Death information for Missouri residents who died in Missouri is available both in an electronic file and as a paper record through a Memorandum of Understanding with DHSS's vital records unit. Death information for Missouri residents that die elsewhere is available from some but not all states. MCR staff conduct death clearance and follow-back on in-state cancer deaths not matched in the registry database; the number of new cases identified only through death certificates is <3% for data from 1998–2003. MCR staff process over 45 000 records annually. After case consolidation, this yields approximately 28 000 Missouri incident cases.

Quality control is an ongoing process at MCR. All records receive an initial review and an additional in-depth review. Before each call for data, all cases are run against GenEdits and Interrecord Edits and corrections made prior to submission. Quality control is also part of each data request. Prior to finalising the data request, the data are reviewed for accuracy. In addition, reports are produced whenever necessary to look at possible errors that have been identified through the review process.

Interpreting the results
MCR data meet NPCR standards and North American Association of Central Cancer Registry (NAACCR) criteria for timeliness completeness and quality. While MCR data are more than 95% complete (i.e., >95% of expected cases are available within 24 months of the close of a diagnosis year), some sites are less complete. Less than 60% of expected melanoma skin cancer cases were reported annually through 2003. In 2004, MCR initiated reporting of melanoma skin cancers by physicians; this has resulted in increased reporting of these cases. Prostate cancer cases were also underreported. In 2005, Missouri became one of eight states funded by CDC-NPCR to pilot web-based reporting of prostate cancers by physicians. We hope to see an increase in reporting of these cases in 2006.

Use of the data
Missouri incidence data are used for program planning and evaluation, epidemiological studies, cancer cluster investigations, annual reports and a variety of other purposes. Missouri incidence data are available online at http://www.dhss.mo.gov/cancerMICA/ by site, race, age group and geographic unit.

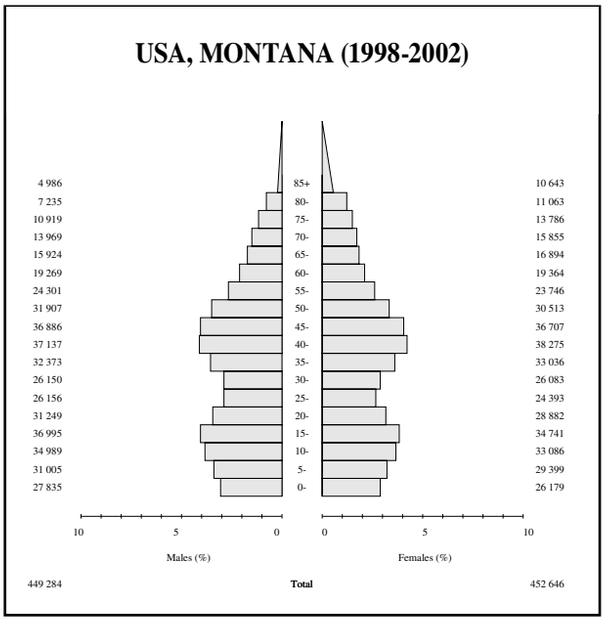
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Montana

Registration area
The Montana Central Tumor Registry (MCTR) is a population-based registry covering the entire State of Montana. The MCTR was started in 1979 by the Montana Tumor Registry Act. About 60% of the state is actually prairie in the Great Plains. Montana is primarily rural. The state ranks fourth among US states in size but has a relatively low population and consequently a very low population density. The race of Montanans is about 92% Caucasian and 6% American Indian.

Cancer care facilities
Montana has 4 American College of Surgeons cancer approved programmes; Benefis Healthcare in Great Falls, St. Patrick Hospital in Missoula, St. Peter's Hospital in Helena, and Billings Clinic in Billings. Other cancer-related facilities include: St. Vincent's Hospital in Billings, Bozeman Deaconess Hospital in Bozeman, St. James Community Hospital in Butte, and Kalispell Regional Hospital in Kalispell.



Registry structure and methods
The MCTR is housed in the Montana State Department of Public Health and Human Services, Division of Public Health and Safety, Bureau of Chronic Disease Prevention and Health Promotion, Cancer Control Section. Financial support includes about 20% of the budget covered by State funds and about 80% of the budget covered by Federal support through the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). MCTR staff include: 1 Cancer Epidemiologist, 1 Program Manager, 1 Administrative Support/Follow-up, and 2 Quality Assurance Technicians. Data collection is passive, with each facility responsible for abstracting and reporting its own cancer cases. MCTR staff do not abstract for any facility. The principal sources of information on cancer cases are hospitals, radiation centres and independent pathology laboratories. MCTR has access to all death certificates from the Office of Vital Statistics on a quarterly basis. Quality control procedures are being developed. Presently, the MCTR undergoes a casefinding, data quality, and timeliness audit by the CDC once every 5 years.

Interpreting the results
The population in Montana is growing and grew almost 10% in 2005. Prior to that, the population increased about 3% since the year 2000. Diagnostic and treatment facilities for cancer patients are increasing, and several cancer treatment facilities are seeking ACoS approval. Montana has breast and cervical cancer screening and a health assistance programme, and PSA testing is common in the population.

Use of the data
The MCTR publishes an annual report that presents topics on incidence rates, mortality rates, incidence by sites, stage at diagnosis, rates by counties, risk and associated factors, age-specific incidence rates, and ten-year trends. Data are used for individual requests for information and are used for cancer cluster investigations. The registry is not currently involved in epidemiological research beyond the production of routine statistics, but the Montana Comprehensive Cancer Program routinely uses our cancer registry data.

Source of population

http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

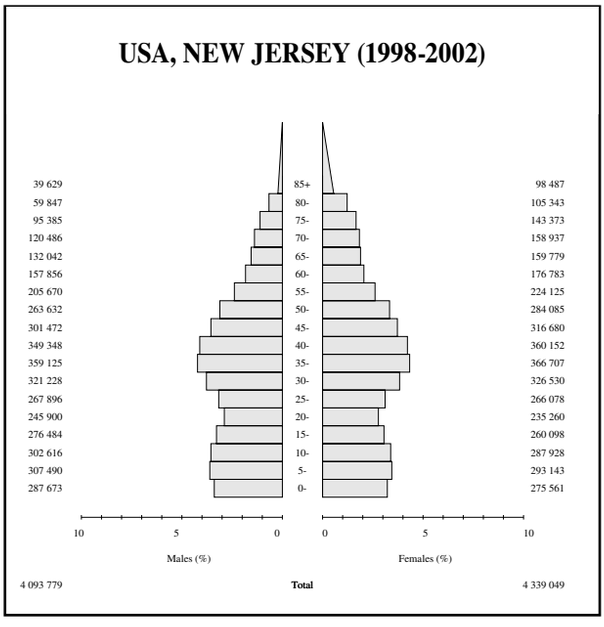
USA, New Jersey

Registration area

New Jersey is located on the east coast of the United States, bordered by the states of New York, Pennsylvania, and Delaware. In 2000, the population of the state of New Jersey comprised over 8.4 million inhabitants. Of these, 13.6% were African American, 13.3% were Hispanic and 5.7% were Asian. The median household income, according to the 2000 census, was US$55 146 (in 1999 dollars). Of the population over 16 years of age, 64.2% are in the labour force.

Cancer care facilities

A total of 76 in-state hospitals report to the registry on a monthly basis via e-mail to a secure, encrypted e-mail server. The proximity of New Jersey to prestigious cancer centres in neighbouring states attracts many residents to seek diagnosis and treatment outside the state. Over 10 000 case reports are received annually from out-of-state sources through reciprocal reporting agreements with other states.



Registry structure and methods

Cancer Epidemiology Services (CES) is located in the Division of Epidemiology, Environmental and Occupational Health Services. CES is financed by both state and federal sources, including the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). There are 42 full-time equivalent staff working in the unit on cancer registry and cancer surveillance activities. Certified Tumor Registrars (CTRs) are employed in all aspects of the registry operations including data collection, quality assurance, reporting and analysis.

The majority of cases are reported by hospitals throughout the state. Abstracting, coding and data entry are conducted at the hospital level by CTRs directly from source records and reported electronically to the central office. All health care facilities are required by law to report cancer cases electronically within three months of discharge or six months of diagnosis or face a penalty. Hospitals are required to report all cases of cancer, regardless of in- or out-patient status. Reporting from non-hospital facilities accounts for a small but growing number of cases. The majority of non-hospitalised cases are reported by 16 independent pathology laboratories. Other sources include 117 surgery centres and 9 free-standing radiation treatment centres. Reports are also received from nursing homes, psychiatric facilities and rehabilitation facilities. Physicians and dentists are required to report non-hospitalised cases. Matching of the registry database with the Department's AIDS registry and the Breast and Cervical Cancer Early Detection Program have resulted in the identification of cases.

Quarterly record linkages are performed between the registry database and the state death file. A built-in death certificate match system links and updates cancer registry records with death information. Linkages are also performed with individual state tax return files, hospital discharge files, motor vehicle driver's license files, the federal Centers for Medicare and Medicaid Services, Social Security Administration, and National Death Index to obtain follow-up information.

Interpreting the results

New Jersey has Gold Certification Status from NAACCR. The data quality assurance programme is a continuous multi-faceted programme of checks and balances, performed by highly skilled CTRs with years of quality control experience. Other components include consistent application of computerised edits, systematic review of problem cases, re-abstracting and re-coding studies centred in hospitals, feedback and training programmes for hospital staff, documentation of policies and procedures, and case-finding audits.

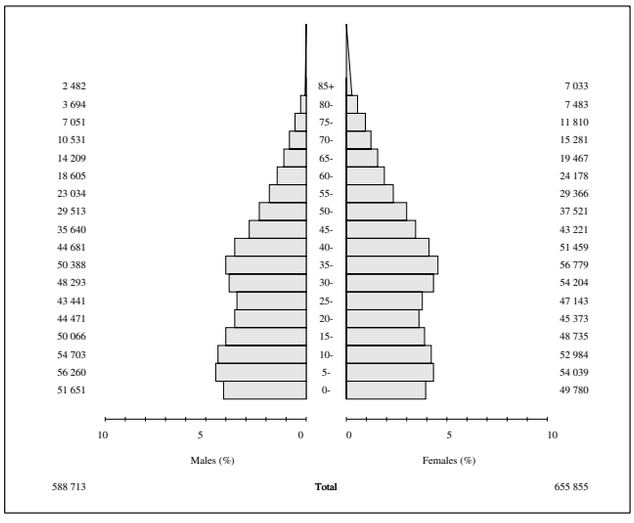
Definite and possible duplicates are electronically generated and resolved by staff. Computerised programs are used to identify multiple primary cancers for review.

Use of the data

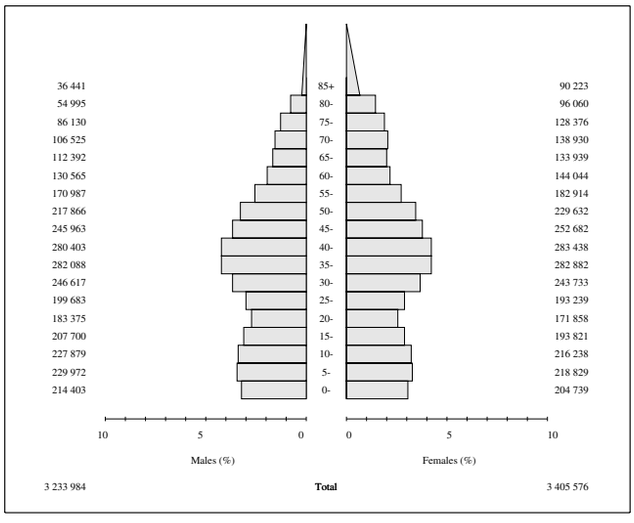
The Cancer Surveillance Program, staffed by epidemiologists and a statistician, monitors cancer incidence trends, disseminates data, and responds to citizens' concerns about cancer. The staff have published a variety of registry reports, including a report on trends in cancer incidence and mortality, cancer survival, cancer prevalence, an in-depth analysis of prostate cancer, breast cancer, colon and rectum cancer, and childhood cancer.

The data are employed in a wide range of activities including applications in cancer control and prevention, aetiological studies, policymaking, and epidemiological research. Registry data were also used to define baseline measures for the general and special populations in the state to establish public health objectives for the next decade.

USA, NEW JERSEY: BLACK (1998-2002)



USA, NEW JERSEY: WHITE (1998-2002)



Source of population
2000 Census of the United States, prepared by the US Bureau of the Census.

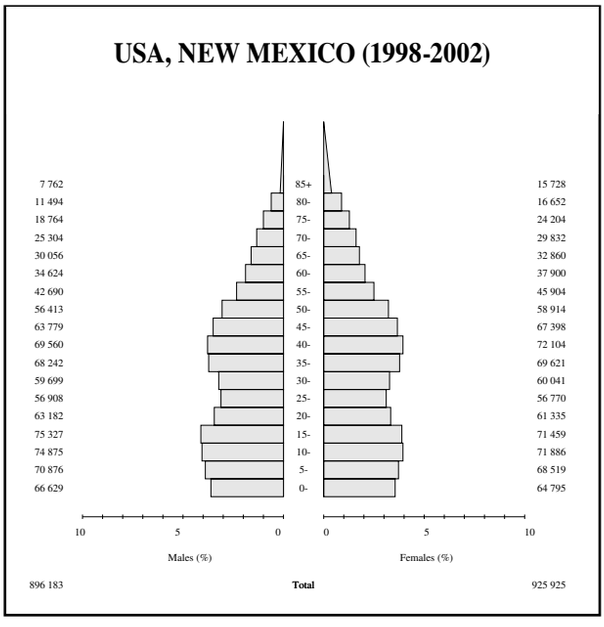
IACR rules (2004) on CI5 IX period.

USA, New Mexico

Registration area

With an area of 314 926 km^2, New Mexico is the fifth largest state in the USA. Located in the southwest of the country (latitude 30° to 37° N), it has extensive high desert and mountain terrain, the altitude ranging from 859 to 4010m above sea level. Rainfall and humidity are low.

Its population is about 1.9 million, of whom approximately one third live in the Albuquerque metropolitan area; the remainder live in small cities or in villages. The population come from diverse ethnic backgrounds: 42% have Spanish and/or Mexican-American heritage (Hispanics); 9.5% are American Indians (Navajo, Pueblo, Apache); 1.9% are Black; about 1% are Asian; the remaining 45% are non-Hispanic white of European descent. A sizeable subgroup of New Mexico's Hispanic population traces its ancestry to Spanish soldiers and colonists who settled in New Mexico during the 17th and 18th centuries. Median levels of education and per capita income are in the lowest decile of the 50 states.



Cancer care facilities

An overwhelming majority of cancer patients in New Mexico are diagnosed and treated at one or more of seven medical facilities that support cancer programmes accredited by the American College of Surgeons. Cancer-related care is also provided by several private oncology and radiation-oncology practices affiliated with the latter medical facilities. Some New Mexico residents receive cancer-related care in neighbouring states; the registry has longstanding agreements with central cancer registries in all bordering states to routinely receive reports on diagnosis or treatment of New Mexico residents.

Registry structure and methods

Cancer reporting has been required (but not enforced) by a State Health Agency regulation since 1922. The New Mexico Tumor Registry, located at the University of New Mexico Cancer Research and Treatment Center in Albuquerque, began operation in 1966 and became the official cancer data repository for the State Health Agency in 1975. Registry funding initially came from the New Mexico Regional Medical Program and since 1973 primarily from the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program.

The registry abstracts and follows all cases of known malignancy. Multiple primaries are counted separately by assigning sequence numbers within the records of individual patients. Patients entered into the registry system are followed for life.

Some of the larger hospitals employ tumour registrars, and abstractors from the central registry travel to other hospitals and clinics throughout the state to review and abstract cancer patient records. The majority of the registry's cases are registered from hospital admission and outpatient records. Other methods of casefinding are used to obtain information on cancer cases not seen in reporting hospitals. Radiation therapy records and death certificates are reviewed regularly.

Medical chart data are entered directly onto diskettes using a software package assembled locally, allowing collection of supplemental data items of special interest to individual hospitals and physicians. It also allows each hospital to analyse its own 30+ year complete dataset and to compare it with a statewide analytical dataset. Data from the abstractors' diskettes are edited, linked and merged into the master file.

Abstracted cases are reviewed for thoroughness and accuracy. The file is ordered by the computer-generated accession numbers, but can be sorted by any item of data. Numerous routine crosschecks are made to eliminate duplicate cases.

Interpreting the results

Cancer surveillance in New Mexico is conducted according to prevailing standards promulgated by the SEER Program and the North American Association of Central Cancer Registries (NAACCR). As such, the data have been subject to the same changes in definitions and coding as other registries that abide by SEER and NAACCR standards. The Registry's geographic area of coverage has remained constant since it initiated statewide coverage in 1969.

Because incidence rates vary by cancer primary site among the State's three largest racial/ethnic groups, New Mexico data must not be considered in aggregate, that is, without stratification by race/ethnicity. Descriptive epidemiological analyses have shown that Hispanics and American Indians have lower rates than the non-Hispanic white population for skin, breast, endometrium, lung and colorectal cancers, and higher rates for stomach, uterine cervix, kidney and gallbladder cancers.

Use of the data

Periodic reports are sent to participating hospitals and individual physicians. The registry also handles over 100 special requests for cancer data annually. The registry has been a casefinding source for a variety of population-based case–control studies relating to cancer etiology. It has also been used to monitor patterns of cancer care and survival in relation to factors such as ethnicity, age and marital status.

The development of new techniques for investigating molecular and cellular changes in preserved tissue specimens has created requests for the registry to help select cases that have documentation of different clinical courses and outcomes.

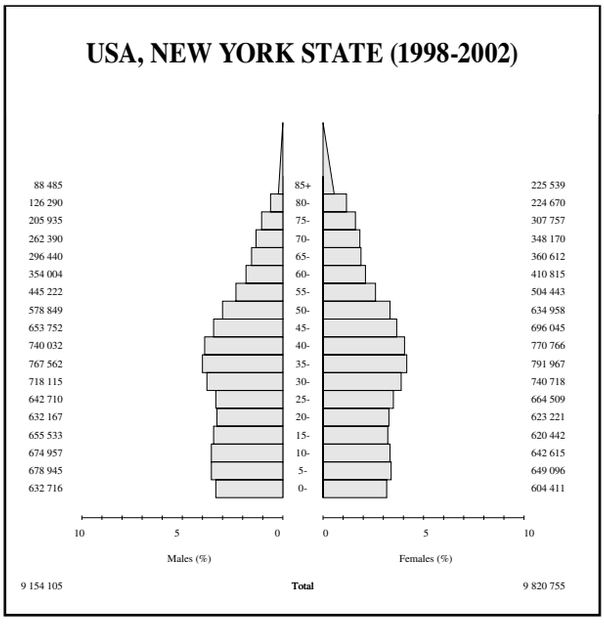
USA, New York State

Registration area

The New York State Cancer Registry (NYSCR) contains reports on all malignant tumours (except basal cell and squamous cell skin cancers), most *in situ* lesions, and certain benign tumours. The Registry, the second oldest state tumour registry in the United States, has had mandated cancer reporting since 1940, when the registration area covered the entire state except New York City. Beginning in 1973, the reporting mandate was extended to include New York City. The Registry has been population-based since 1976.

The population of New York State was 18 976 457 in the year 2000, according to the U.S. census; the estimated population for 2004 is 19 227 088. In 2000, about 90% of the population lived in metropolitan areas; 62% were Non-Hispanic Caucasians, 16% were African-Americans, 15% were Hispanics (of any race), 0.4% were American Indians and 5.5% were Asians (including Pacific Islanders).



Cancer care facilities

Residents of New York State have access to more than 250 acute-care hospitals, including 22 Community Hospital Comprehensive Cancer Care facilities located throughout the State and three National Cancer Institute-designated Comprehensive Cancer Centers. In addition, many freestanding healthcare facilities and private physicians diagnose and treat cancer. There are 54 Ambulatory Surgery Centers and 12 Veterans Administration Hospitals that also provide cancer services.

Registry structure and methods

The Registry is located within the New York State Department of Health (NYSDOH), and is funded partly by the NYSDOH and partly by the National Program of Cancer Registries. The Registry has a director, field staff, coding staff, quality assurance staff, research scientists, computer programmer analysts, and geo-coding and secretarial support staff; 22 staff members are Certified Tumor Registrars.

Law mandates cancer reporting with full personal identifiers. The NYSCR uses passive notification of reports from more than 300 sources including hospitals, pathology and cytology laboratories, radiation treatment centres, ambulatory surgery centres, and state vital records. Data are received electronically in the NAACCR (North American Association of Central Cancer Registries) format and are mostly pre-coded. Many quality checks, including single field range and validity edits as well as interfield edits, are routinely applied to the data and much time and effort are devoted to elimination of duplicate case reports.

New York State law mandates reporting of mortality, and death certificates are electronically matched against Registry files. Cancer deaths not previously reported to the Registry are followed back to hospitals and physicians for complete diagnostic information. To further assure complete reporting, cases diagnosed and/or treated in 16 other states are identified through reciprocal reporting agreements.

In order to provide detailed geographic information for cancer surveillance and cancer mapping, attempts are made to geo-code the addresses of all cancer cases to the county, postal code and census block level.

In order to evaluate the quality and completeness of cancer reporting, the Registry conducts routine audits at hospitals throughout the state. Staff from the Field Services Unit also compare the number of cases reported to the number of cancer-related hospital discharges for consistency. Results are used to target the location and content of statewide educational and training programs.

Interpreting the results

The registration area for the Registry has been constant since 1973. Although no new class of sources of cancer case reports was added during 1998–2002, ambulatory surgery centres have been added as sources more recently.

Changes in cancer screening patterns have had a large impact on the number of cancer cases diagnosed in New York State. According to the Behavioral Risk Factor Surveillance System telephone survey, the percentage of persons aged 50 years or older who ever had colorectal cancer screening grew from 56.6% in 1996 to 67.8% in 2002. By 1997 (the most recent available data), 74.6% of New York women aged fifty or older had had a mammogram and clinical breast exam within the previous two years; 77% of men aged fifty or older had ever had a prostate specific antigen (PSA) test.

Use of the data

The Registry prepares an extensive annual report of cancer incidence and mortality. The most frequently requested tables are produced in a printed volume, whereas the entire report is available on our Web site: http://www.health.state.ny.us.

Within the New York State Department of Health, Registry data are used extensively for cancer surveillance and for program planning. The Cancer Surveillance Program has access to the database for use in investigating possible cancer clusters and addressing community concerns. The Cancer Screening Research and Evaluation unit uses Registry data for programme evaluation, targeting and prioritisation. The Health Department provides cancer education and awareness programs and funds screening for breast, cervical and colorectal cancer for under- or uninsured individuals.

Cancer Registry data are routinely provided to other organisations within the state for planning and evaluation of health services, grass-roots advocacy, and generating etiologic hypotheses. In addition, the Registry is utilised by researchers nationwide for a variety of epidemiological studies.

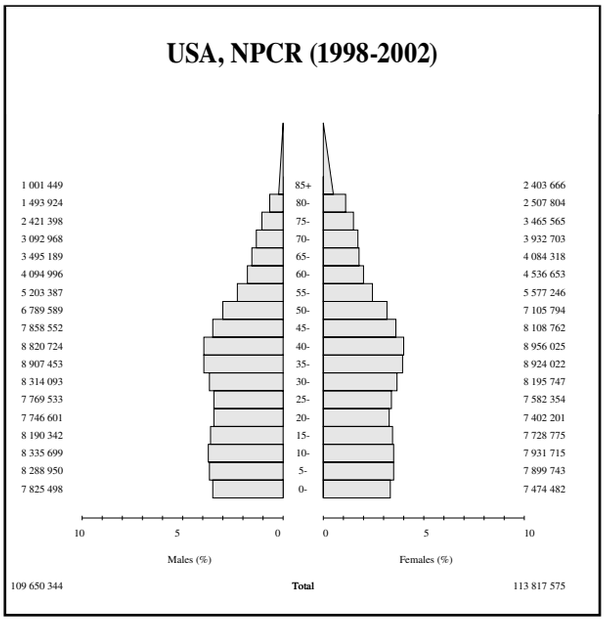
USA, National Program of Cancer Registries (NPCR)

Registration area

The United States Centers for Disease Control and Prevention (CDC) provides financial and technical support to Public Health Departments (or their designees) for the operation and maintenance of population-based cancer registries in 45 states, the District of Columbia and 3 US territories (Palau, Puerto Rico, and Virgin Islands): 27 to collect data for cases diagnosed beginning in 1995; 13 to collect data for cases diagnosed beginning in 1996; 4 to collect data for cases diagnosed beginning in 1997; and the remaining 5 to collect data for cases diagnosed either beginning in 1999 or 2000. The remaining 5 states—Connecticut, Hawaii, Iowa, New Mexico, and Utah—receive federal support from the National Cancer Institute's (NCI) Surveillance Epidemiology and End Results (SEER) Program. In addition, SEER supports metropolitan area cancer registries in the states of California, Georgia, Michigan and Washington. These metropolitan area registries report their incidence data both to the National Cancer Institute and to the statewide NPCR-funded cancer registries and, thus, these data are included in the NPCR statewide database. The NPCR programme covers 96% of the US population. In 2000, SEER began to provide support for the operations of cancer registries in California, Kentucky, Louisiana and New Jersey. These four registries report their incidence data to both CDC and NCI.



To be eligible for inclusion in this volume of *Cancer in Five Continents*, NPCR-funded cancer registries had to consent and had to report data that met stringent criteria for incidence reporting as established by CDC (see below). Incidence data from 31 cancer registries reported to CDC as of January 2005 (Alabama, Alaska, Arizona, California, Colorado, District of Columbia, Florida, Georgia, Idaho, Illinois, Indiana, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Missouri, Montana, New Jersey, New York, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, Texas, Vermont, Washington, West Virginia, Wisconsin), covering 83% of the U.S. population, met these criteria and are included. Each registry is featured separately in this report.

Registry structure and methods

Participating cancer registries transmit data to CDC using a standardised record layout and coding system documented by the North American Association of Central Cancer Registries. The data files are updated annually beginning with the diagnosis year for which the cancer registry first received federal support (e.g. 1995 or later). Reportable cases include all malignant and in situ neoplasm as defined in ICD-0, excepting most non-melanoma skin cancers and in situ cervical cancer. Neither the patient's name nor the name of the reporting facility is provided to CDC. Upon arrival at CDC, the data undergo evaluation prior to publication and use.

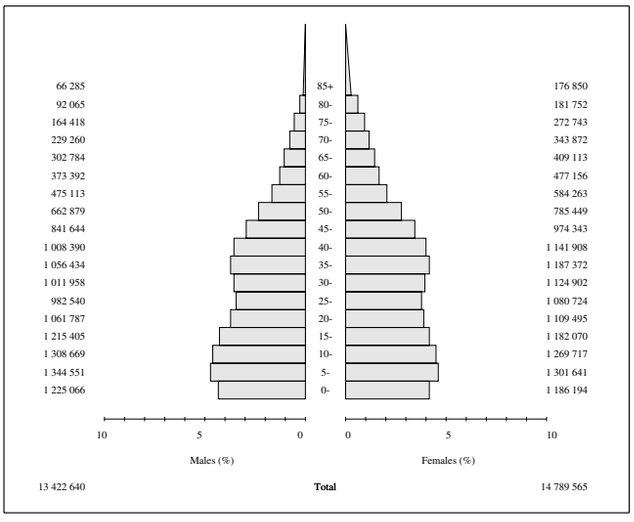
Data included in this report are from statewide or metropolitan area cancer registries that have high quality cancer incidence data for 1998–2002 as demonstrated by meeting the following data quality criteria for all cancer sites combined:

- Case ascertainment is 90% or more complete. The registry data include at least 90% of the expected cases where the expected cases are estimated by using methods developed by the North American Association of Central Cancer Registries.
- No more than 5% of cases are ascertained solely on the basis of a death certificate.
- No more than 3% of cases are missing information on sex.
- No more than 3% of cases are missing information on age.
- No more than 5% of cases are missing information on race.
- At least 97% of the registry's records passed a set of single-field and inter-field computerised edits.

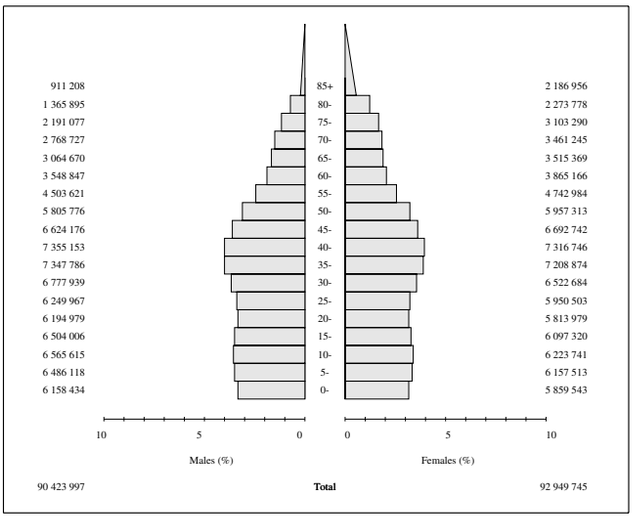
Use of the data

CDC and NCI annually publish the *United States Cancer Statistics* report, beginning with cases diagnosed in 1999 forward. These federal cancer statistics are also made available to the public and cancer control planners through public use and restricted access data sets. In addition, several monographs and reports on special topics have been published.

USA, NPCR: BLACK (1998-2002)



USA, NPCR: WHITE (1998-2002)



Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Ohio

Registration area
Ohio's cancer registry covers a population of over 11 000 000 residents. The state has large metropolitan areas of over 1 000 000 as well as rural areas. Manufacturing, agriculture, and business are all important factors in Ohio's economy and play roles in the lifestyles of Ohioans.

Cancer care facilities
Ohio has two National Cancer Institute designated Comprehensive Cancer Centers: Case Western Reserve University in Cleveland and The Arthur G. James Cancer Hospital in Columbus. The state has over 160 other hospitals, most of which offer cancer treatment services.

Registry structure and methods
The registry, established by Ohio law in 1991, is in the Ohio Department of Health and is funded by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and by the State of Ohio.

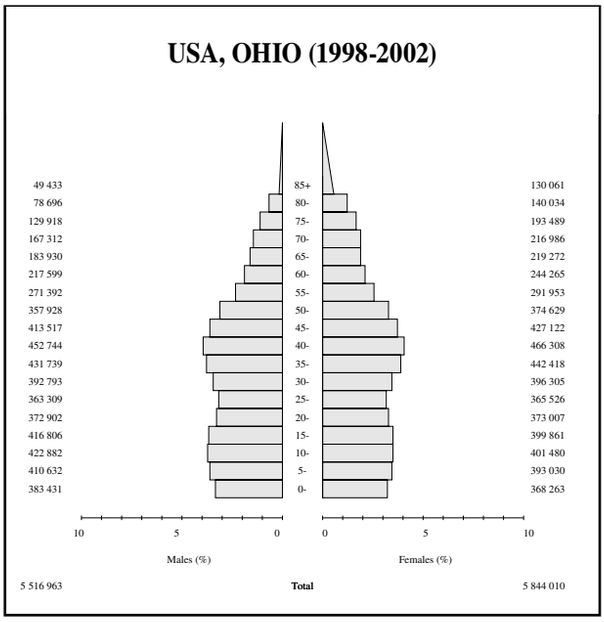
Staff include 13 cancer registrars, four administrative staff, and two IT staff members.

Cancer data are reportable by law for all who diagnose and/or treat cancer patients, including pathology laboratories. Some data are submitted on paper, but increasingly data are submitted in electronic formats, either on diskettes or via email in encrypted files. The OCISS recently opened a Web-based system for reporting and is enrolling the larger reporting sources to use it at this time. This is the mode of reporting that the registry is promoting, as it automates much of the processing of data as they are submitted.

Principal sources of information on cancer cases are the hospitals, free-standing radiation centres, and ambulatory surgery centres. Physicians' offices and pathology laboratories also report data. The pathology laboratories are seen as increasingly good sources of initial cancer data as electronic means for them to report are developed.

Death certificates are available for the death clearance procedures that are performed annually. The Bureau of Vital Statistics, where the death certificates are housed, is a part of the Department of Health, where the Registry is housed.

Automated editing processes are part of the database software used by the Registry and of the Web-based reporting system recently put into operation. Quality control procedures are attended to on a daily basis by OCISS registrars. Evaluation of data by two national organisations each year also comprises part of quality control.

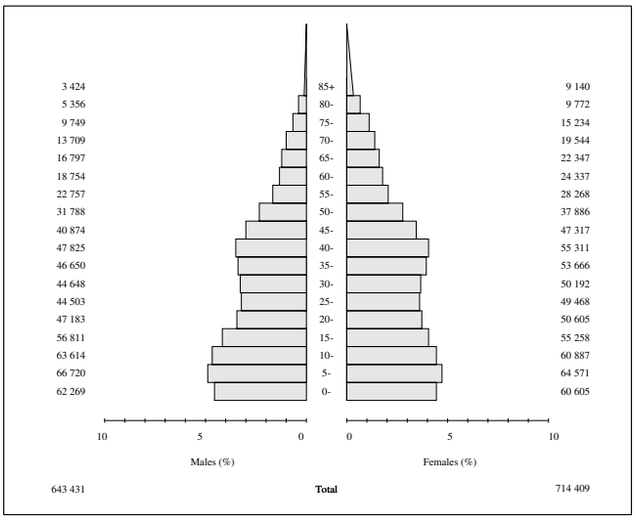


Use of the data
Reporting of incidence, extent of disease, survival: The registry produces an annual report and posts data in the Data Warehouse at the Ohio Department of Health's website. In addition, several "fact sheets" are published each year for different types of cancers. These are available on the registry's website or in paper form. Data are also submitted to the National Program for Cancer Registries and to the North American Association for Central Cancer Registries, both of which publish annual reports and post data to web sites.

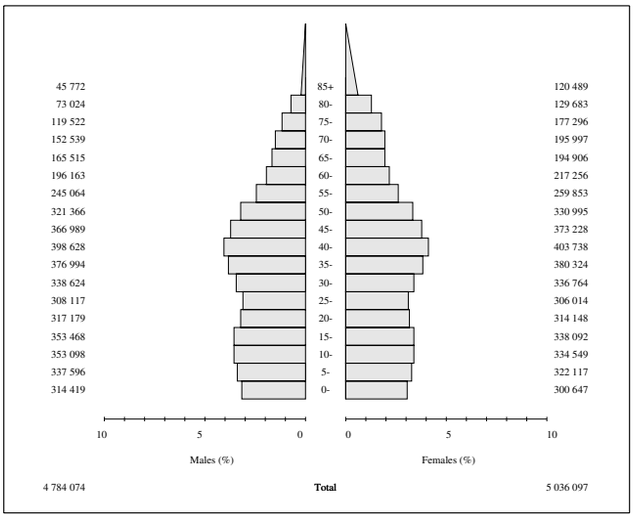
Research use: Registry data are accessed by researchers several times each year, often including Institutional Review Board approvals for confidential data.

Planning and evaluation of heath services: Local health departments use registry data to perform surveillance studies and to support funding efforts to provide screening and other cancer-related services.

USA, OHIO: BLACK (1998-2002)



USA, OHIO: WHITE (1998-2002)



Source of population

July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

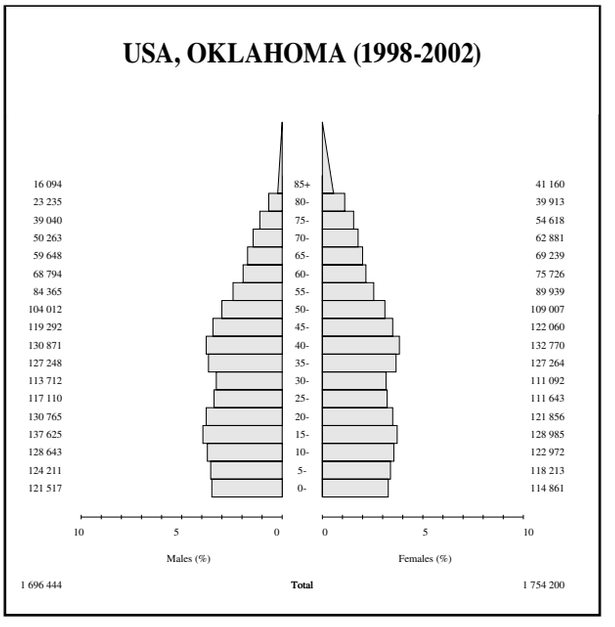
USA, Oklahoma

Registration area
The Oklahoma Central Cancer Registry covers the population of 77 counties within the state of Oklahoma, in the central United States. The population at the most recent census (2000) was 3 450 654. About 65% of the population lives in urban areas (>2 250 000 inhabitants).

Cancer care facilities
General health care in the state is provided predominantly by private practitioners and hospitals. This includes 17 facilities that have been designated as Approved Cancer Programs by the American College of Surgeons Commission on Cancer.

Registry structure and methods
The registry is located within the Oklahoma State Department of Health, and is funded partly by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR), and partly by the state health department. The registry is staffed by a surveillance coordinator, nine full-time registrars, an administrative assistant and a part-time epidemiologist.

The OCCR utilizes automated data collection via electronic media to receive an average of 31 000 cancer reports per year from approximately 230 active sources of data such as cancer hospitals, general hospitals, teaching hospitals, pathology laboratories, freestanding oncology centres, mammography centres, ambulatory surgery centres, Indian Health facilities, some dermatologists' and urologists' offices, and the vital statistics office of the Oklahoma State Department of Health, along with data sharing with surrounding states. Registrars within individual facilities involved in diagnosis and treatment of cancers identify and abstract information on cases of cancer, diagnosed by all methods, among residents of the state.



Interpreting the results
OCCR is obtaining 96% of the incident cancer cases in Oklahoma each year, of which 2% are Death Certificate Only cases. An additional 4% is believed to be diagnosed and/or treated but not reported to OCCR, or may be attributable to error in the method of estimating completeness.

Use of the data
OCCR publishes a quarterly report of Chronic Disease Service Data Analysis, or an article focussing on a specific topic around cancer important for Oklahoma. Data are presented to interested groups, including but not limited to Comprehensive Cancer, Indian Health Services, College of Public Health, and the Oklahoma State Legislature, and OCCR has instituted and maintains a queryable cancer data website (http://www.health.ok.gov/stats/cancer/).

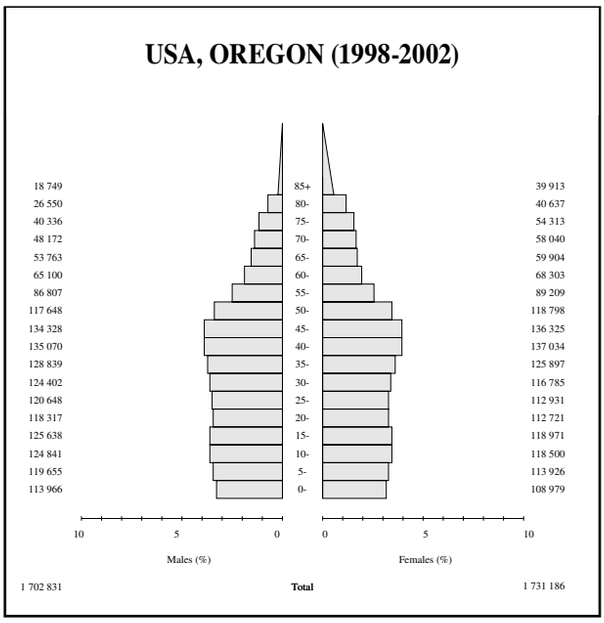
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Oregon

Registration area
The Oregon State Cancer Registry (OSCaR) is a population-based registry covering the state of Oregon. Oregon, located in the northwestern United States, is about 360 miles long and 261 miles wide. The population in the 2000 census was 3 421 399 and is estimated to have increased to 3 594 586 by 2004. About 70% of the population lives in urban areas. The racial make-up is approximately 87% White, 3% Asian, 1.6% Black and 1.3% American Indian/Alaska Native (approximately 7% are some other race or two or more races).

Cancer care facilities
Cancer care in the state is provided predominantly by 56 hospitals. Of these, 18 have American College of Surgeons Commission on Cancer-approved cancer programs. Additional services are provided at ambulatory surgery centres, freestanding cancer treatment facilities, physicians' offices and clinics around the state.



Registry structure and methods
The registry is located within the Health Promotion and Chronic Disease Prevention section of the Oregon Department of Human Services, along with the Oregon Breast and Cervical Cancer Early Detection Program and the Oregon Comprehensive Cancer Control Program. Funding for the registry comes through a cooperative agreement with the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). The program manager, one office-support staff, five certified cancer registrars and three research analysts staff the registry.
Information processed by OSCaR comes from a variety of sources including: hospital cancer registries, state cancer registries, ambulatory surgery centres, physician offices, vital statistics, pathology laboratories, hospital medical record departments and the US Census Bureau. Approximately 75% of Oregon's cancer cases are collected by certified tumour registrars (CTR) in established hospital cancer registries and are reported to OSCaR. The statewide population-based cancer registry collects the remaining 25% from non-registry hospitals, outpatient clinics, physician offices, and neighbouring state registries diagnosing or treating Oregon residents. The annual process of death clearance identifies missed cases by comparing the Registry database with Oregon death certificates. The majority of cases identified through death clearance are subsequently reported by one of the above-mentioned sources. Remaining cases are recorded as death certificate only cases.

Interpreting the results
OSCaR consistently exceeds the NPCR standard of ascertaining 95% of expected cases based on the North American Association of Central Cancer Registries case completeness calculation.

Use of the data
The registry prepares an annual report of cancer incidence and mortality highlighting cancer risks, screening and trends. Other cancer control programmes use registry data for planning and evaluation. The registry also collaborates with local and national researchers on a variety of special studies designed to reduce the burden of cancer in Oregonians.

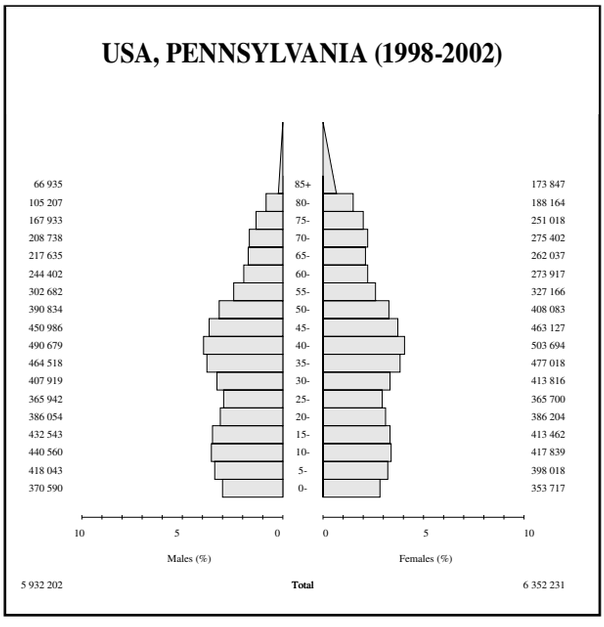
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Pennsylvania

Registration area

The Pennsylvania Cancer Registry covers the population of the entire state and has been collecting statewide cancer data since 1985. In Pennsylvania, racial categories other than White made up 13.5% of the total population in 2004, compared to 11.5% in 1990, 9.6% in 1980, and 9.0% in 1970. Of the 1 674 223 residents other than White in 2004, 77.7% identified themselves as Black. The number of Asian/Pacific Islanders in the state increased by 9.2% between 2000 and 2004, and by 77% between 1990 and 2004. The number of black residents increased by 6.3% between 2000 and 2004, and by 19.4% between 1990 and 2004. The number of Hispanics in Pennsylvania increased by 81 464 (20.7%) between 2000 and 2004. Between 1990 and 2000, the number of Hispanic residents increased by almost 70%. Pennsylvania Hispanics tend to be much younger than white, black or even Asian/Pacific Islander residents. The 2004 median age for Hispanics was 24.9, compared to 31.7 for Asian/Pacific Islanders, 31.1 for Blacks, and 39.9 for Whites.



Cancer care facilities

Cancer cases are reported by all acute care hospitals in Pennsylvania. Interstate data exchange is conducted regularly with all contiguous states as well as Florida and Michigan. Other non-hospital sources where patients are diagnosed or treated for cancer also report to the PA Cancer Registry, including freestanding pathology laboratories, radiation therapy centres and physicians' offices.

Registry structure and methods

The PA Cancer Registry operates in the Pennsylvania Department of Health, and is funded by the state and the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR).

Fifteen staff work directly on PA Cancer Registry operations (8/15 are CTRs); two additional statistical support staff generate cancer reports and statistics; 1 IT staff provides computer support; 1.5 epidemiologists perform analysis of cancer data.

The PA Cancer Registry uses the CDC Registry Plus cancer data system; uses active casefinding from all reporting sources and passive follow-up through death clearance. PA Cancer Registry has received NAACCR Gold Certification for approximately six years.

Principal sources of information on cancer cases include acute care hospitals, freestanding pathology laboratories, radiation therapy and cancer centres, physicians' offices, and death certificates.

Death certificate files (with personal identifiers) are used annually to conduct death clearance by linking to update existing cancer cases with death information, and by identifying cancer deaths not included in the registry.

Cancer is a reportable disease in Pennsylvania as mandated by the Pennsylvania Cancer Control, Prevention, and Research Act (Act 224) and Department of Health Regulations regarding communicable and non-communicable diseases. According to Act 224, information collected by the Cancer Registry is confidential but can be used for medical research as approved by the PA Department of Health Policy.

The PA Cancer Registry uses national and local edits metafiles to edit data to meet national and local standards; conducts casefinding and re-abstracting audits at reporting hospitals; performs special studies to check data and identify potential quality issues used to improve data and train staff; and requests feedback from data users to improve data and increase usability of data.

Interpreting the results

There has been a shift in diagnosis and treatment of certain types of cancer from inpatient to outpatient facilities. The only recent change in case definition and coding is the addition of benign brain and CNS tumours to reportable diagnoses effective in 2004. Pennsylvania participates in the CDC Breast and Cervical cancer screening program.

In the 2004 Behavioral Risk Factor Surveillance System (BRFSS) survey, 78% of Pennsylvania men aged 50 and older said that they had ever had a prostate-specific antigen blood test to detect the presence of prostate cancer.

Use of the data

Incidence, extent of disease, and survival data are produced and made available on PA Department of Health website at www.health.state.pa.us/stats. Cancer data are used for medical research studies as approved by the PA Department of Health, and we receive numerous requests for hospital-specific data, which is used to evaluate their services.

USA, PENNSYLVANIA: BLACK (1998-2002)

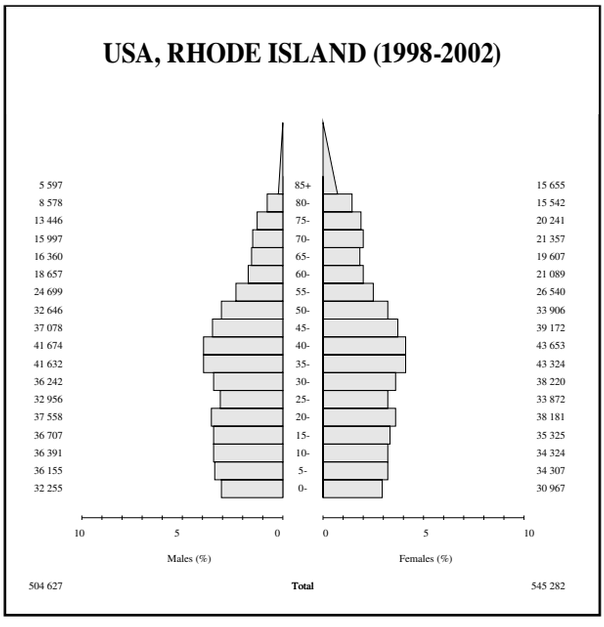
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Rhode Island

Registration area
The Rhode Island Cancer Registry, an administrative unit of the Rhode Island Department of Health (RIDOH), covers the population of the State of Rhode Island and Providence Plantations in the Northeastern region of the United States. The population at the most recent census (2000) was 1 048 000. About 85% of the population lives in urban areas; roughly 10% are of recent immigrant status.

Cancer care facilities
General health care in the region is provided by 10 privately funded acute care hospitals, one federally funded acute care (veterans') hospital, 25 community health centres (for primary care), and several hundred private physician offices (for primary and specialty care). All eleven hospitals provide cancer care; all have Cancer Care Committees. Nine of the eleven acute care hospitals have American College of Surgeons-approved cancer programs. In addition, the state is served by two freestanding radiotherapy centres.



Registry structure and methods
The Rhode Island Cancer Registry (RICR) is a population-based cancer registry established in 1985. It began collecting reports of newly diagnosed cancers on 1 October 1986. Under Rhode Island law, all newly diagnosed cases of cancer and of benign tumours of the brain and central nervous system are reportable to the Rhode Island Cancer Registry. The Registry is funded by the State and by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). It is run collaboratively by the Rhode Island Department of Health (HEALTH) and the Hospital Association of Rhode Island (HARI). There are 5 persons employed: a Registry Manager, 2 Registrars (CTR), a Data Manager and an epidemiologist. The profile of the principal sources of information are as follows: 85–90% of case reports are received from 11 acute care hospitals; ~10% of case reports are "developed" from pathology reports; ~5% of case reports are "developed" from death certificates (1–2% "death certificate only" cases).

In Rhode Island, all cancer registries (including 11 hospital-based tumour registries and the central registry) conform to data collection standards adopted by the American College of Surgeons (*FORDS)*. Data are transmitted electronically from hospital registries and other reporting sources to the central registry and vice versa. The Rhode Island Cancer Registry is a member of the North American Association of Central Cancer Registries (NAACCR), and conforms to NAACCR standards for central registry operations, including data reporting, editing and transmission.

Interpreting the results
Data from the Rhode Island Cancer Registry have consistently met NAACCR quality control standards for inclusion in national and international aggregates of cancer incidence. Reporting completeness exceeds 95 %, with less than 3% of cases being reported on the basis of death certificates only (DCO). During the 1990s, Rhode Island experienced surges in screening for cancers of the breast (clinical breast exam and mammogram), cervix (pelvic exam and Pap test), colon-rectum (faecal occult blood and endoscopy), and prostate (PSA), resulting in increases in the incidence of cancers of the breast, cervix and prostate, and a decrease in the incidence of cancer of the colon-rectum (because of the removal of pre-cancerous lesions).

Rhode Island is a highly urbanised state, best compared with highly urbanised areas such as cities. Historically, Rhode Island has had an "urban cancer profile," with higher incidence of cancers related to tobacco and alcohol use, cancers related to diet, and cancers of the female breast and of the prostate.

Use of the data
The Registry produces official cancer statistics for Rhode Island, including an annual report posted on the RIDOH website, and also supplies cancer data to researchers (strict guidelines are used to protect patient confidentiality so that individuals cannot be identified). Special studies are performed regularly to support the planning and management of cancer control efforts in the state, and also to assist with environmental health risk assessments.

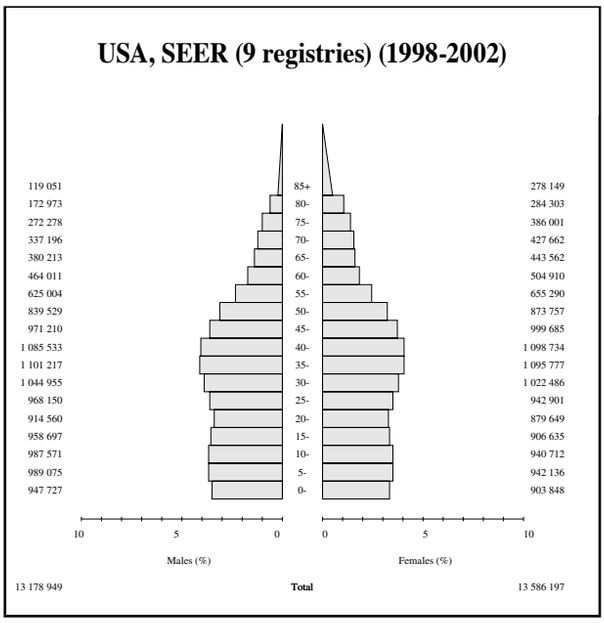
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, SEER

Registration area

Participants in the Surveillance, Epidemiology, and End Results (SEER) Program were selected on the basis of their ability to operate and maintain a population-based cancer reporting system and for their population sub-groups, which were of special epidemiological interest. The SEER Program now covers over one fourth of the United States (US) population. Data are available back to at least 1975 from the SEER 9 areas (States of Connecticut, Iowa, New Mexico, and Utah and metropolitan areas San Francisco-Oakland (California), Detroit (Michigan), Seattle-Puget Sound (Washington), and Atlanta (Georgia)), which represent about 10% of the total US population. The SEER 14 areas (States of Connecticut, Iowa, New Mexico, Utah, Kentucky, New Jersey, and Louisiana and metropolitan areas Greater California (San Francisco-Oakland and San Jose-Monterey) (California), Los Angeles (California), Greater California (California excluding SF/SJM/LA), Detroit (Michigan), Seattle-Puget Sound (Washington), and Atlanta plus Rural Georgia (Georgia)) cover 26.1% of the US population. The data are considered fairly representative of the US population with respect to selected demographic variables. With regard to race, rural blacks are under-represented, whereas other minority populations such as Chinese, Japanese, Hawaiians and American Indians are over-represented. Over 350 000 new cases of *in situ* and invasive cancers are added each year to the SEER database. In addition to contributing to SEER, many of the SEER areas report data separately for their own registry in this volume.



Registry structure and methods

The SEER Program is a continuing project of the Surveillance Research Program of the US National Cancer Institute (NCI). The Program was initiated in 1973 as an outgrowth of the End Results Program and the three National Cancer Surveys and The National Cancer Act of 1971, which mandated the collection, analysis and dissemination of data useful in the prevention, diagnosis and treatment of cancer. The participating regions were selected principally for their ability to operate and maintain a population-based cancer reporting system and for their epidemiologically significant population subgroups.

The Program aims to determine the incidence and survival of cancer in selected geographical areas in relation to demographic and social characteristics of the population and to estimate annual cancer incidence for the US. Trends in incidence by site and histology are monitored, as are survival and trends in survival. Studies are conducted to identify etiological factors that can possibly reveal groups of the population at high or low cancer risk, which may be defined by social, occupational, environmental, dietary or other characteristics. Geographical information systems are developed for use with SEER and other population-based central cancer registries in the USA through linkage with small area demographic census data and national surveys on health behaviours, risk factors and environmental exposures for use in cancer control and surveillance research.

Data for publication are transmitted by the participants to NCI 22 months after the end of each calendar year. All malignant and *in situ* neoplasms as defined in ICD-O are collected except for basal and squamous skin cancers since 1973, *in situ* and CIN III of the cervix uteri since 1996, and PIN III since 2001. SEER registries must collect information about extent of disease, first course of therapy, and follow-up. Neither the patient's name nor the name of the hospital is provided to NCI.

The SEER Program conducts studies to evaluate quality and completeness of data, and provides specialist training for personnel.

Use of the data

Updated annually and provided as a public service in print and electronic formats, SEER data are used by thousands of researchers, clinicians, public health officials, legislators, policymakers, community groups, and the public. Each year since 1985, the NCI has published a 'SEER Annual Cancer Statistics Review' (www.seer.cancer.gov/publications), which comprises principally SEER cancer incidence and survival data, and cancer mortality data from the National Center for Health Statistics. In addition, data are made available on the SEER home page (www.seer.cancer.gov) and via SEER*Stat software on a client-server and CD-ROM.

USA, South Carolina

Registration area
The South Carolina Central Cancer Registry covers the entire state. The state is 60.5% urban and 39.5% rural, comprised racially of 31% African American, 68% Caucasian, and 1% Other Races.

Cancer care facilities
Health care is provided in SC by 65 acute care hospitals, ~35 freestanding surgical and oncology treatment centres, and private oncology practices.

Registry structure and methods
The SCCCR is located at the SC Department of Health and Environmental Control, funded by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and state funds.

The SCCCR is comprised of 17 staff, including the Director, 10 CTRs who perform data coordination and quality control, 4 Master's-level research analysts, database manager and statistician, and administrative coordinator.

The majority of data collection (85%) comes from pre-coded data from hospital registries. The remainder is actively sought by staff from small hospitals, pathology labs, freestanding treatment centres and physicians.

The hospital medical record is the principal source of information on cancer cases. Secondly, pathology reports from reference labs are a contributing source of information.

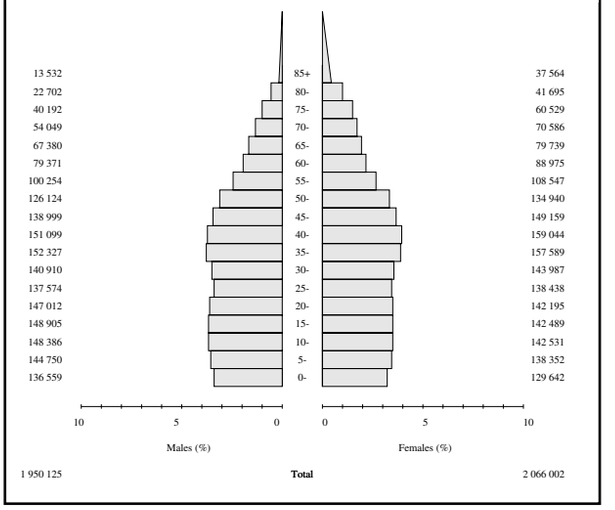
Access to death certificates (with personal identifiers) is provided by the SC Div of Vital Registry.

Cancer reporting is mandated in SC by the state statute SC Code Section 44-35-10-60. Confidential patient, hospital and physician identifiers are reported via state statute and protected by this law.

Quality control procedures include visual review of patient abstracted data along with computerised inter-record, intra-record edits. Routine casefinding and quality audits are performed at reporting facilities. Once every five years, the SCCCR undergoes a national data completeness and quality audit. Results of most recent national audit: 97% completeness, 98% accuracy.

The SCCCR has attained Gold Certification for 6 years, and Silver for 2 from the NAACCR certification process since 1997.

USA, SOUTH CAROLINA (1998-2002)



Use of the data
The data are used to report official annual cancer incidence, extent of disease and survival for the state. An annual Cancer Report Card is produced as well as County Cancer Fact Sheets. Assessments of community cancer concerns (potential cancer clusters) are carried out with the data.

The data are available through the on-line query system, called SC Community Assessment Network (SCAN). Researchers and the public can create their own query by accessing the cancer module on SCAN. Maps, trend graphs, bar charts and tables are provided.

The data are used for research as prescribed by the protocol for data release and approval by the advisory committee. Data are used by multiple university researchers as well as SC medical schools, by state cancer control planners and evaluators, the statewide Cancer Alliance, and the American Cancer Society.

USA, SOUTH CAROLINA: BLACK (1998-2002)

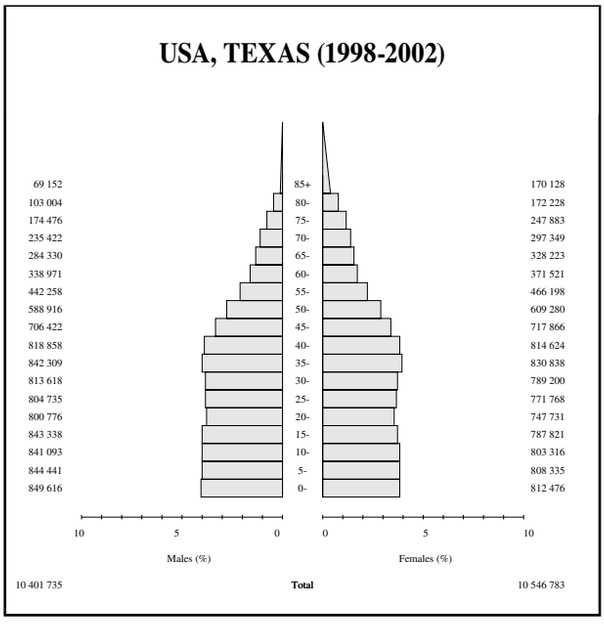
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Texas

Registration area
The Texas Cancer Registry (TCR) covers the statewide population of Texas, in the south central United States of America. The estimated mid-year 2000 population census was 20 851 820. Although 86% of the population lives in urban counties, these represent only 30.3% of all Texas counties. The 2000 Texas population also shows considerable race/ethnic diversity with 53.1% being non-Hispanic White, 32.0% Hispanic (of any race), 11.6% Black and 3.3% Other Races.

Cancer care facilities
Cancer care in Texas may be provided by a wide variety of facilities, from large medical centres specialising in cancer treatment to community hospitals. The M.D. Anderson Cancer Center in Houston, Texas is a leader with a worldwide reputation in cancer care, as well as research, education and prevention. Numerous other research-based University medical centres and American College of Surgeons Accredited Cancer Programs are found in the state, and provide state-of-the-art cancer diagnosis and treatment.



Registry structure and methods
The TCR is part of the Texas Department of State Health Services (DSHS), and also receives federal funding from the US Centers for Disease Control and Prevention, National Program of Central Cancer Registries (NPCR). The TCR is staffed by 46 full-time state staff and 10 contract staff.

Our cancer data are reported to the TCR primarily by hospitals, but also by cancer treatment centres, pathology labs and medical practitioners.

Cancer case reporting in Texas is required by state law (Chapter 82, Health and Safety Code), and the TCR has specific cancer reporting rules. Cancer death reporting is through the Texas DSHS, Vital Statistics Unit. Cancer case reporting is done electronically for approximately 98% of cases, and 0% of deaths. All personal identifying data are considered confidential, and are used internally by TCR staff for registry operations and approved research purposes. Confidential data may only be released with DSHS Institutional Review Board approval.

Texas Cancer Registry staff work with the cancer reporters to provide training in case reporting as needed, and technical assistance to identify and abstract information on cancer cases. In addition, the TCR has data exchange agreements with other states to obtain data on Texas residents diagnosed and/or treated out-of-state.

Interpreting the results
We estimate the completeness of our cancer data by predicting the number of cases to be expected each year, based on standard age-, sex-, and race/ethnic-specific rates from another state registry with a similar population to the Texas population. Based on these estimates, we do not produce a final dataset for any given year until the estimated completeness of the data is at least 95%. The average completeness of the entire 1998–2002 dataset is 96.3%.

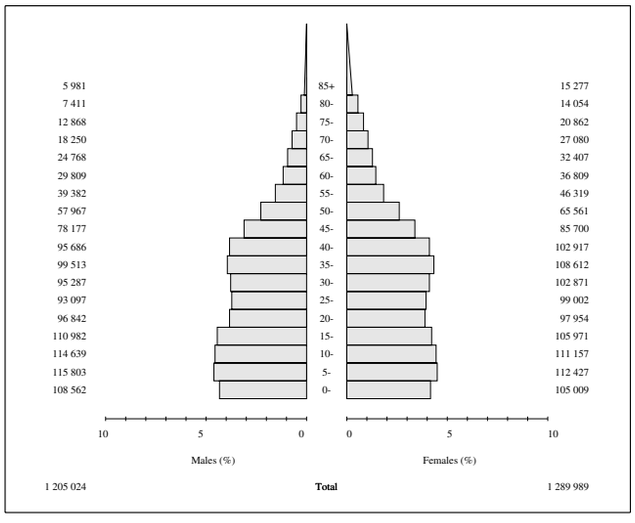
The population of Texas is unusual in that there is a large proportion of the total statewide population made up of Hispanics. For most major cancer types, incidence rates in Hispanics are lower than for many other race/ethnic groups, leading to generally lower (overall) incidence rates in Texas than in surrounding states. For this reason, Texas rates are also reported by race/ethnicity.

The goal of the DSHS Breast and Cervical Cancer Control Program is to reduce mortality from breast and cervical cancer in Texas. This program provides free breast and cervical cancer screening and diagnostic services to low-income women with no health insurance at over 200 sites throughout Texas. Since 1991, more than 190 000 women in Texas have received early cancer detection services through this program.

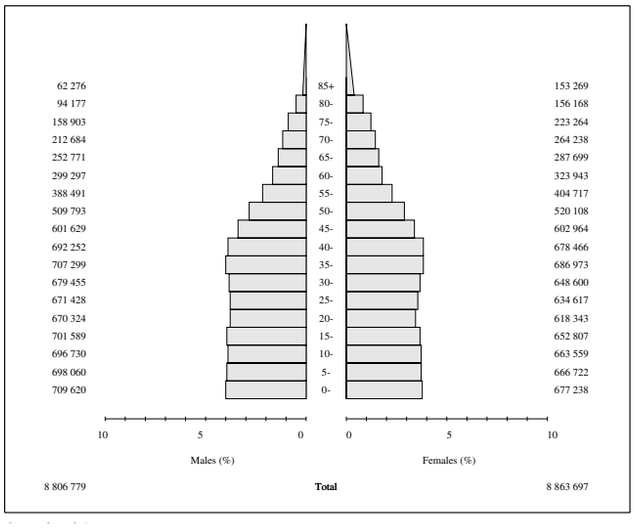
According to the DSHS Texas Behavioral Risk Factor Surveillance System, in 2002, 70% of Texas men 50 years and older had a PSA test within the past five years. Non-Hispanic white men and men 65 and older had higher PSA prevalence rates, while Hispanic males and those with less than a high school education have lower PSA rates.

Use of the data
The registry produces an annual report of cancer incidence and mortality, examining race/ethnic differences, trends, and other patterns in statewide cancer data, and maintains tables of average annual rates, published on our website. These data are provided statewide, by sex and race/ethnicity, and by various geographical areas including counties. Also provided are childhood cancer incidence and mortality rates, as well as estimated cases and deaths for future years at the statewide, regional and county levels. Data are also provided to external customers upon request, and have resulted in numerous specialised studies of cancer incidence and mortality, as well as health services studies.

USA, TEXAS: BLACK (1998-2002)



USA, TEXAS: WHITE (1998-2002)



Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census. http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

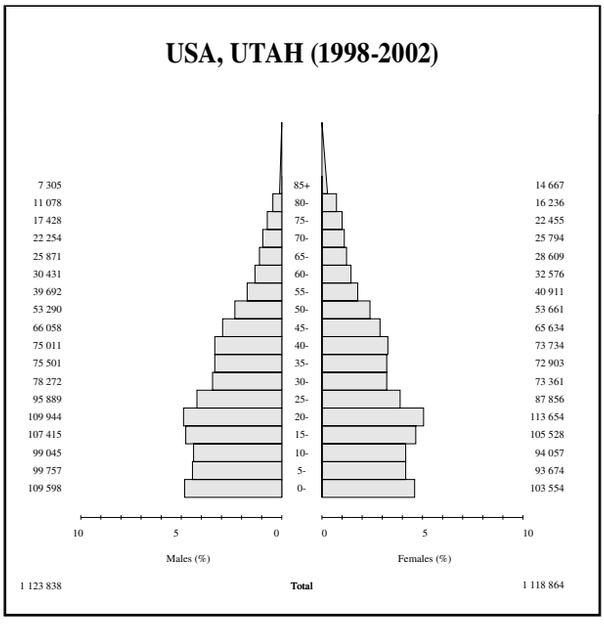
USA, Utah

Registration area

The State of Utah covers 299 888 km^2 and is geographically the 11th largest US state. There were 2 233 169 residents in Utah at the time of the decennial census conducted in 2000. Approximately 89% of Utah residents are white, and 9% are of Hispanic origin (any race). The remaining population comprises American Indians (1.3%), Asians (1.7%), Pacific Islanders (0.7%), blacks (0.8%), and individuals of other racial/ethnic backgrounds (4.2%).

Utah's 2000 birth rate of 21.1/1000 was approximately 47% higher than the national average of 14.4/1000. As a result, the median age of Utah residents was 27.1 years, fully 8 years younger than the national figure of 35.3 years.

Approximately 70% of Utah residents are members of the Church of Jesus Christ of Latter-day Saints (LDS), whose doctrine places a high value on marriage and encourages large families (hence, high fertility rates). The church also discourages consumption of tobacco, alcohol and caffeine, and proscribes premarital sex, profoundly influencing cancer incidence and mortality rates in Utah.



Cancer care facilities

Forty-five health care facilities in Utah routinely provide cancer-related services to state residents. Seven of Utah's largest facilities have ACoS accredited cancer care programmes. Fourteen hospitals in Utah support one or more cancer registrars on their staff, including each of the AcoS-accredited facilities. Six Utah hospitals have radiation therapy units; there are 2 freestanding radiation therapy units in the state.

Registry structure and methods

The Utah Cancer Registry (UCR) has operated since 1966 on a population-based, statewide level. In 1973, UCR became one of the original members of the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program. UCR has continuously participated in the SEER program since that time.

UCR is staffed by 20 employees, including 5 administrative personnel, 1 research coordinator, 2 supervisors, 3 coders, 4 field pathology and hospital abstractors, 1 follow-up coordinator, 3 IT and data support staff, and 1 data entry/file clerk.

Cancer cases are identified and followed using information from hospitals, pathology laboratories, radiation treatment centres, physician offices, nursing homes, vital records, other central cancer registries, and by direct patient contact. Cancer reporting in Utah is mandated by legislation and regulatory rule.

Central registry personnel annually travel to outlying areas to identify and abstract cases in the smaller rural hospitals. The UCR is now advancing toward electronic pathology reporting and plans to receive some 90% of pathology reports electronically within the next 5 years.

Both hospital-based registrars and central registry personnel conduct active and passive follow-up of cancer patients. For example, registry records are routinely linked with administrative databases, including those maintained by the Centers for Medicare/Medicaid Services and the Utah Department of Public Safety's Driver License Division, and local voter registration files. UCR routinely queries vital records from the Utah Department of Health for information about cancer patients who may have died. In rare instances, death certificates may provide information about cancer cases that were not identified through other sources.

Cancer data are abstracted and coded by both hospital-based registrars and central registry personnel. Hospital-based registrars submit abstracts and pathology reports to UCR, allowing central registry staff to monitor the quality of data and process difficult-to-code items such as extent of disease and site-specific treatment. All electronic records are subjected to various automated edits developed by SEER and other professional organizations. UCR also participates in SEER-sponsored quality control projects.

Interpreting the results

With respect to the 1998–2002 data, the UCR has had consistent coverage, geographically and demographically. UCR, along with other registries in the SEER Program, changed topograhy and morphology coding rules from ICD-O-1 to ICD-O-2 for cases diagnosed from 1998–2000 and 2001–2002, respectively. However, these changes in coding rules will not have an effect on the 1998–2002 statistics, as 1998–2000 cases were retrospectively coded using ICD-O-2.

According to data from the Utah Behavioral Risk Factor Surveillance System (BRFSS), as many as 64% (95%CI 61–68%) of men aged 40+ surveyed in 2002 reported a PSA test within the last five years. Therefore, PSA is relatively common in the Utah population.

Use of the data

UCR data are combined with those from other SEER Program participants to monitor cancer trends in the USA. UCR data are also well utilised by independent investigators and the Utah Department of Health for studies of cancer etiology, prevention and control. By combining UCR records with genealogy files and other sources, researchers have made notable contributions in the field of cancer genetics. The registry maintains a web page (http://ucr.utah.edu), publishes trends in incidence and mortality annually, and responds to *ad hoc* requests for cancer-related data.

Source of population
Surveillance, Epidemiology, and End Results (SEER) Program (www.seer.cancer.gov) SEER*Stat Database: Populations – Total U.S. (1969–2003) – Linked To County Attributes – Total U.S., 1969–2003 Counties, National Cancer Institute, DCCPS, Surveillance Research Program, Cancer Statistics Branch, released January 2006.

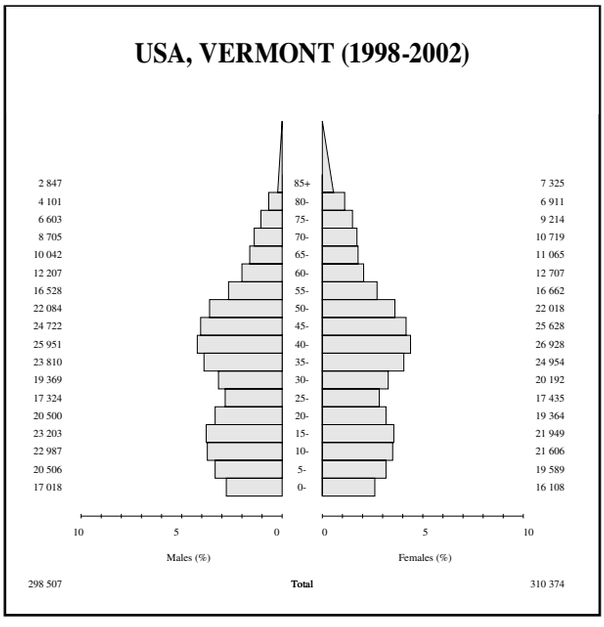
Multiple primary rules used
IACR rules (2004) on CI5 IX period .

Notes on the data
C44 does not include basal cell or squamous cell carcinoma except for skin of anus.

USA, Vermont

Registration area
The Vermont Cancer Registry (VCR) covers the population of the State of Vermont. The population at the most recent census (2000) was 608 827. About 38% of the population lives in urban areas (areas designated by the U.S. Census Bureau as Urbanized Areas and/or Urban Clusters); 97% are white, the remainder other races.

Cancer care facilities
General health care in the region is provided predominantly by 15 hospitals, including a Veterans Affairs Medical Center. This is supplemented by private practitioners and one outpatient radiation therapy facility. The Vermont Cancer Center (VCC) is an NCI-designated facility for Phase I, II and III therapeutic clinical trials. VCC and Fletcher Allen Health Care (FAHC) are located in Burlington, the largest city in Vermont, and provide radiotherapy, cancer surgery and chemotherapy services. Patients suspected to have cancer in the primary and secondary care facilities in the registry area are mostly referred to VCC, FAHC, Dartmouth Hitchcock Medical Center in neighbouring New Hampshire, one of the hospitals with comprehensive cancer services in the state, or occasionally to one of the hospitals in Boston, MA or Albany, NY.



Registry structure and methods
The registry is located within the Vermont Department of Health and is funded by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and in-kind support from reporting hospitals. The registry is staffed by a full-time director, a cancer data specialist, a certified cancer registrar and an epidemiologist.

The VCR uses active case finding from 13 non-federal hospital cancer registries, one out-of-state reference pathology laboratory, one radiation therapy centre, 5 dermatologists, 8 urologists, 1 VA hospital, and a small number of other physicians. The cancer registry is linked with the VT death file annually. Non-matches are followed back to identify cases potentially unreported to VCR. These cases identified by death certificates are followed back with hospitals and physicians to either rule out reportability or be reported to VCR. Records that cannot be followed back to source records are accessioned as death-certificate-only cases. Cancer is required to be reported by Vermont health care facilities and healthcare providers. Interstate data exchange agreements exist with all bordering states and Florida.

Electronic editing, visual editing, and hospital auditing are all used as quality assurance strategies.

Interpreting the results
VCR data are estimated to be at least 95% complete, 24 months after the close of the diagnosis year.

Ladies First is a health screening program for Vermont women. Ladies First removes financial barriers, which prevents many women from being screened for breast and cervical cancer.

Use of the data
VCR prepares an annual report of cancer incidence, highlighting trends and changes. Site-specific reports are also published. Because active follow-up is not conducted, survival analyses have not been possible.

The registry is currently involved in the NCI-sponsored New England Study of Environment and Health, which is investigating the possible causes of elevated bladder cancer incidence and mortality in the states of Maine, New Hampshire and Vermont.

VCR data are used for planning and evaluation of cancer control objectives e.g. comprehensive cancer control, detailed incidence/mortality statistics, health event investigations and program evaluation.

For Needs Assessment/ Program Planning: VCR completed a project using GIS to identify opportunities for breast cancer screening of income-eligible women. The purpose of the project was to identify areas where the Ladies First breast and cervical program services are less utilised and enrolment could be increased, particularly for women ages 40–64 who meet eligibility requirements, by examining the current enrolment of Ladies First clients, the distribution of providers and facilities providing services, screening patterns and stage distribution of breast cancers to determine if there were any parallels with areas of lower membership.

The VCR has started routinely evaluating late stage diagnosis of certain cancers (colon, breast, cervical) as a measure of the effectiveness of cancer screening efforts.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

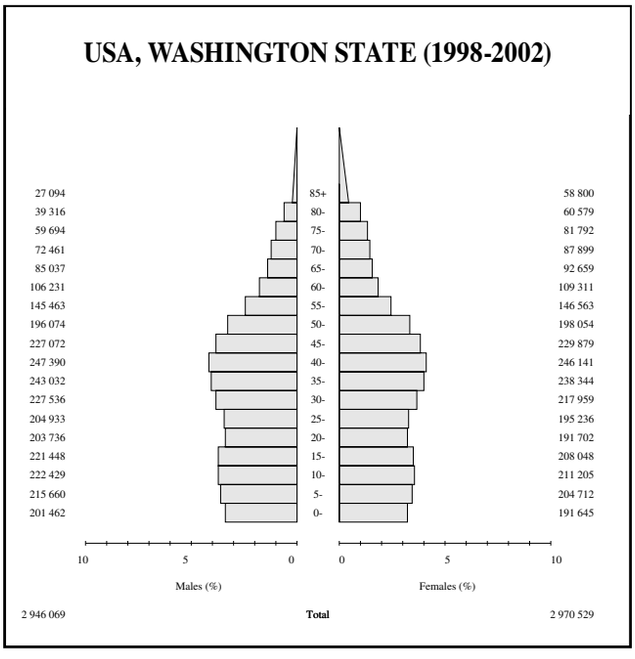
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Washington State

Registration area
The Washington State Cancer Registry is responsible for cancer case surveillance throughout the State of Washington (USA). The mid-2000 population for Washington State is reported at 5 894 121 of which approximately 49.8% are males, 50.2% females.

Registry structure and methods
Case information is provided to the State Cancer Registry by healthcare facilities (hospitals, laboratories, physician offices) throughout the state.
The registry is located within the Washington State Department of Health and is funded by the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR) and partly by state funds. The registry is staffed by experienced certified tumour registrars (CTRs) and an epidemiologist.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes.



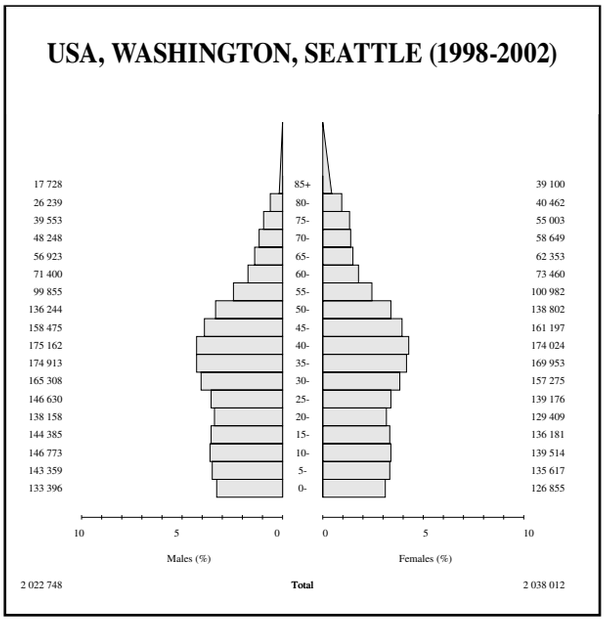
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The
population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Washington, Seattle

Registration area
The Cancer Surveillance System (CSS) operates under the Surveillance, Epidemiology, and End Results (SEER) program to provide incidence, treatment, and follow-up data on all newly-diagnosed malignancies (except non-melanotic skin cancers and *in situ* cancers of the cervix) occurring in residents of 13 counties of northwest Washington State.

While the geographic area has not changed, the population has grown substantially in size. The CSS reporting area has a population of over 4.2 million (based on 2000 census), which is approximately 70% of the state population. Counties in the reporting area include Clallum, Grays Harbor, Island, Jefferson, King, Kitsap, Mason, Pierce, San Juan, Skagit, Snohomish, Thurston and Whatcom. The CSS reporting area includes four Primary Metropolitan Statistical Areas (PMSAs). Approximately 86% of the people in the CSS reporting area reside in these PMSAs: Seattle-Bellevue-Everett (57.7%), Tacoma (17.5%), Bremerton (5.6%) and Olympia (5.1%). The racial distribution of the population base is as follows (2000 data): 80.4% White, 5.3% Hispanic, 4.2% Black, 7.2% Asian, 1.4% Native American, and 1.5% Other.



Cancer care facilities
Cancer patients have extensive access to diagnostic and treatment facilities throughout the CSS catchment area. The increasing provision of services in outpatient settings has necessitated expansion of activities to make sure that cancers and details about them are not missed.

Registry structure and methods
The registry is located within Fred Hutchinson Cancer Research Center (FHCRC), and is funded primarily by the SEER Program, and partly by the FHCRC and the Washington State Department of Health. The registry is staffed by 28 full-time technical staff members and 9 hourly technical/data processing staff, and 3.5 programming staff, 2 part-time epidemiologists, 1 part-time staff scientist, and 1 part-time administrator.

The CSS registry uses active case finding from over 100 sources of data consisting of cancer hospitals, general hospitals, teaching hospitals, pathology laboratories and the Washington State Bureau of Vital Statistics. All the case finding is performed at the central registry office. Abstraction of medical records is performed by a mix of hospital staff and registry staff. The latter perform abstracting either at the healthcare facilities or via remote access at the central office. All the coding and case consolidation is performed in the central office by registry staff. Both active and passive follow-up methods are used. Passive follow-up is performed via data linkage with both medical and non-medical source records. Active follow-up consists of annual letters sent to the physicians. Death clearance and unduplication activities are performed annually. The data are submitted annually to the SEER Program and North American Association of Central Cancer Registries (NAACCR), and monthly to the State registry.

As a member of SEER, we annually evaluate the completeness and accuracy of the information recorded.

Interpreting the results
This registry has no circumstances that are particularly different from any other region with a highly-medicalised society.

Use of the data
CSS provides reports to reporting hospitals on a monthly basis. Identifiable information is reported only to the reporting physician or institution, to FHCRC investigators conducting IRB-approved research, and to the state Department of Health as required by law. Statistical reports for publication contain no data identifying patients, physicians or institutions. Non-identifiable data are released to scientists working at the local, regional, national and international level. Aggregate reports of non-identifiable data, such as incidence rates by county or 5-year survival rates, are provided to the public upon request. The CSS responds to many requests from the local medical and scientific community, registrars, health care administrators, news media, public, Cancer Information Service, and students receiving graduate training in public health sciences.

CSS also contributes to collaborative studies involving multiple SEER areas. Data released to SEER are stripped of information which would identify the patient, physician, or reporting institution and is identified only by a unique number assigned by the CSS.

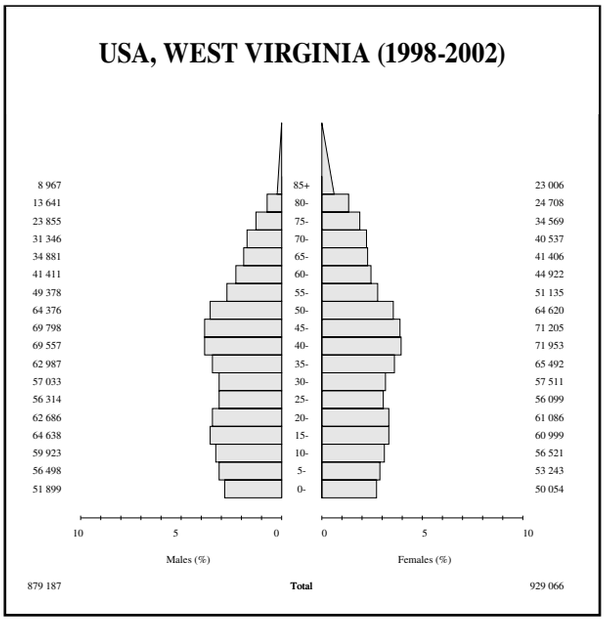
Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, West Virginia

Registration area
The West Virginia Cancer Registry (WVCR) covers the state of West Virginia, which is the only state that is classified as entirely Appalachian. West Virginia is racially and ethnically homogeneous, with 95% of its population identifying as white and 0.7% identifying as Hispanic. West Virginians have an overall lower educational attainment than the US as a whole, with 75.2% of persons 25 and older having a high school education or higher (80.4% for the US), lower per capita income ($16 477 compared to $21 587) and a higher median age (38.9 years compared to 35.3 years). West Virginia is one of the least urban states in the United States, with 46.1% of the state's population living in urban areas.

Cancer care facilities
As of January 2006, 51 of West Virginia's 55 counties were classified by the US Department of Health and Human Services as medically underserved or had medically underserved populations. West Virginia has 57 hospitals, 11 of which have cancer programs approved by the Commission on Cancer. In addition, there are 18 free-standing cancer diagnostic and treatment centres and 7 day surgery centres.



Registry structure and methods
The West Virginia Cancer Registry is part of the West Virginia Department of Health and Human Resources, Bureau for Public Health, Office of Epidemiology and Health Promotion, Division of Surveillance and Disease Control and is funded by the State of West Virginia and the US Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR). WVCR has 10 full-time staff including 4 cancer surveillance staff, 3 data quality staff, a programmer analyst, an epidemiologist/program director and an administrative professional. WVCR receives electronic reports from hospitals with cancer registries and provides abstracting services to other hospitals as well as free-standing diagnostic and treatment facilities, day surgery centres and large urology and dermatology practices. WVCR also receives pathology reports and conducts annual linkages with death certificates. Cancer is reportable by law in West Virginia.

WVCR performs computerised edits on all data and visual editing on a minimum of 10% of cases from each reporter. Additional data quality studies are performed as indicated by the results of the computerised and visual edits. Hospitals undergo case-finding and re-abstracting audits every five years but may be audited more frequently if systematic problems are found. To maintain quality control, formal studies/evaluations are carried out. West Virginia Cancer Registry data are submitted to NAACCR for evaluation of completeness and quality, and also undergo regular audit by NPCR.

Interpreting the results
West Virginia is known to have relatively high levels of cancer risk factors including tobacco use and obesity in comparison to the US, screening rates for breast and cervical cancer similar to those of the US and colonoscopy and sigmoidoscopy rates lower than those of the US. BRFSS data indicate that PSA testing levels in West Virginia are similar to those in the US as a whole.

Use of the data
The West Virginia Cancer Registry publishes an annual report on cancer incidence and mortality in West Virginia, conducts investigations of possible cancer clusters, performs analyses as needed for special projects, promotes the use of WVCR data in planning and evaluation of cancer control activities and makes de-identified data available to approved researchers.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The
population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.
http://www.seer.cancer.gov/popdata.

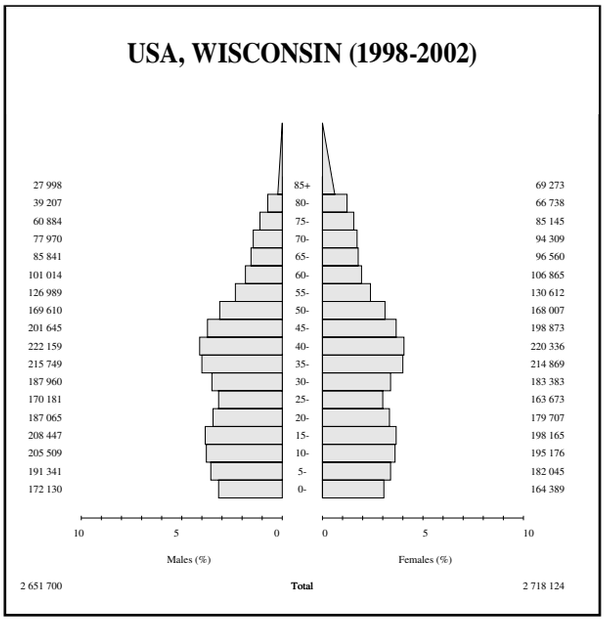
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

USA, Wisconsin

Registration area
The Wisconsin Cancer Reporting System (WCRS) covers the statewide population of Wisconsin, USA. The population at the most recent census (2000) was 5 363 675. About 89% of the population is white, 6% African American, 1% American Indian or Native Alaskan, 2% Asian/Pacific Islander and 1% multiple race. Almost 4% are of Hispanic origin.

Cancer care facilities
Wisconsin has approximately 150 hospitals and over 1700 clinics (including radiation therapy centres, health maintenance organisation outpatient clinics and private physician offices) serving its population. Residents living near state borders may cross into other states for their cancer diagnoses and care depending on proximity to the out-of-state facilities and restrictions based on insurance coverage.

Registry structure and methods
WCRS is located within the Bureau of Health Information and Policy, Wisconsin Department of Health and Family Services. It is funded partly by general purpose revenue funds (25%) and by the US Centers for Disease Control and Prevention through the National Program of Cancer Registries (NPCR) (75%). The registry has six full-time staff: a program director, epidemiologist, CTR data editor and state trainer, quality control data and GIS analyst, data processor, office operations assistant and a part time data entry staff person. WCRS collects data (passive data collection) from Wisconsin hospitals, clinics, physician offices and out-of-state hospitals along state borders. These facilities are required to submit data electronically using the NAACCR standard layout or on paper using the WCRS reporting form. Wisconsin also has data exchange agreements with 19 other state central cancer registries, and receives data on Wisconsin residents from those registries annually. WCRS conducts an annual link with the Wisconsin Resident Death File to update death information on cases previously reported and identify cases not previously reported by the above mentioned sources. Follow up is conducted on the death certificate only cases annually. Cancer is a reportable disease in Wisconsin per Chapter 255.04, Wisconsin statutes. Data submitted to WCRS is processed through a combination of NPCR-required and recommended edits and Wisconsin-specific edits. All cases are edited electronically, and the incoming paper reports are also reviewed manually. WCRS participates annually in the NAACCR Certification Process and has received the Silver or Gold standard for its data every year since 1995.



Interpreting the results
Wisconsin incidence rates overall remain stable but can be influenced by periodic reporting anomalies (e.g. a facility loses cancer reporter and cannot submit for extended period) or inconsistent reporting on residents seen outside of Wisconsin for diagnosis and/or care.

Use of the data
WCRS data are published in an annual report (incidence and mortality rates by site, diagnosis year, race and county, stage at diagnosis). Special site-specific reports are periodically produced. Data are used by researchers for case control studies, linkage studies, and extensively by comprehensive cancer control organisations for planning and prevention strategies.

Source of population
July 1 county population estimates by age, sex, race, and Hispanic origin; postcensal estimates based on 2000 United States Census. The population data include the bridged single–race estimates derived from the original multiple–race categories in the 2000 United States Census.

Bahrain

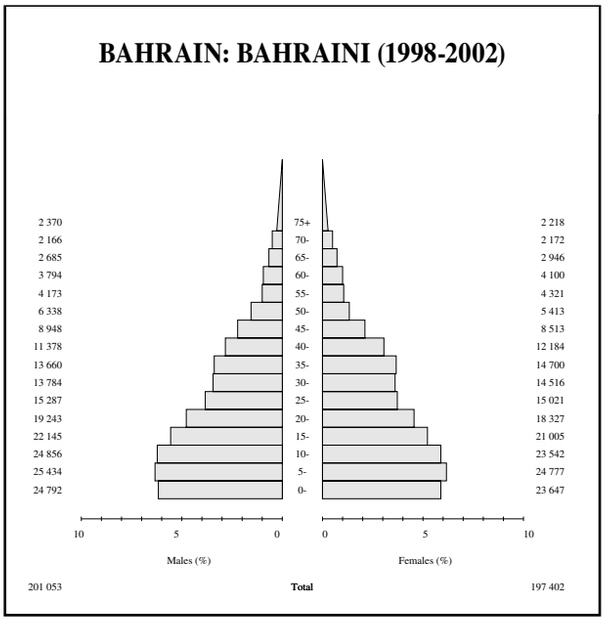
Registration area

The Kingdom of Bahrain is located centrally on the southern shores of the Arabian Gulf, and comprises an archipelago with a total area of 717.5 km^2. Bahrain Island is the largest of these islands, accounting for nearly 83% of the total area of the kingdom and the capital, Manama.

According to the 2001 census, the total population of Bahrain was 650 604 persons of whom 405 667 (62.4%) were Bahraini, and 244 937 non-Bahraini.

The growth rate between the 1991 and 2001 censuses was 2.7% for the total population, 2.5% for the Bahraini and 3.1% for non-Bahraini. The five-year average estimated mid-year population for 1998–2002 was 638 033 of whom 398 455 (62.5%) were Bahraini and 239 578 (37.5%) non-Bahraini. The majority of the non-Bahraini population (69.2%) are males, who form the major part of the workforce. This population is characterised by a very rapid turnover during the year, and their transitional nature could affect the interpretation of cancer occurrence.



Cancer care facilities

The government provides high-standard comprehensive health care to residents, including public health, primary, secondary and tertiary care services. Primary healthcare is delivered through 22 well-equipped health centres distributed in all geographic regions. Secondary care is provided through the main government hospital, Salmaniya Medical Complex (SMC), recently expanded to house the new Oncology Services Centre equipped with the latest diagnostic and treatment technology including chemotherapy, radiotherapy, immunotherapy and bone marrow transplant.

The Royal Medical Services Hospital of the Bahrain Defense Force (BDF) is the second general secondary hospital, primarily serving Ministry of Defense employees and their families. Secondary care is also provided by six other private hospitals. Together, the government and private hospitals have a capacity of around 2000 beds and ratios of 22 doctors and 50 nurses per 10 000 population.

Registry structure and methods

The Bahrain Cancer Registry (BCR) is a population-based registry covering all residents in the country. Per ministerial decree 5/1994 cancer became notifiable to the Cancer Registry Office, part of the Medical Review Office of the Ministry of Health. The registry is operated by a part-time epidemiologist and a part-time medical records technician working as a tumour registrar.

Cases are registered as having a malignant disease in the BCR whether microscopically or clinically diagnosed. Personal, clinical and tumour details are collected using a specially designed registration form, and entered and checked for duplication and consistency using CANREG IV. Coding anatomical sites and morphology of tumours is according to the ICD-O-3.

In addition to passive notification, case finding is enhanced by several approaches. Clinical records of cancer patients admitted to SMC, the main source of cases, are sorted out at the Medical Record Department (MRD) upon discharge and checked for their registration status. The registrar visits the BDF Hospital periodically to review and identify lists of newly diagnosed cases.

The registry also receives regular cancer death notifications from the Birth and Death Registration Office at the Ministry of Health. Death cases are cross-matched with the registered cases to sort out the unmatched cases, which are then followed back for any information on their malignancy and date of diagnosis. Those with insufficient clinical information or information not indicative of cancer are registered as "Death Certificate Only" (DCO) cases.

Using the check program, data are examined for duplicate registration as well as for illogical errors in the combinations of variables such as site-sex, site-morphology and age-morphology. Data are also examined for illogical combinations that cannot be captured by CANREG, such as morphology versus basis of diagnosis (e.g. leukaemia), behaviour versus stage codes (for in-situ), basis of diagnosis versus status codes (for DCO) and morphology versus stage. Cases in which diagnosis was based on histology of metastasis (secondary site) are reviewed to ensure that the depicted site is for the suggested primary tumour.

Missing data on date of birth are replaced by the first two digits of the Central Population Register (CPR) number, which represents the year of birth. In this case the first day of January is designated to complete the full date of birth. Missing data for unknown primary site (PSU) and other variables are sought and recorded when found.

Interpreting the results

Underreporting is expected especially for patients who might have sought treatment in private hospitals or abroad. However, Bahrain is a small country, and free cancer treatment facilities, especially radiotherapy, are located in one public hospital (SMC) providing good opportunity for capturing cases not known to the registry. Those seeking treatment abroad may eventually come to the SMC for further treatment or follow-up, or will be captured by the national and well established death register. The CANREG software has limitations in morphology descriptions of non-invasive cancer (e.g. *in situ* or non-infiltrating intraductal carcinoma); however, these can be identified by behaviour

and stage codes. The problems of duplication and unknown age in Bahrain is minimal because of the unique identification number (the CPR number) that is assigned for each resident.

Use of the data
The registry produces regular statistical reports that show the distribution of different types of cancer according to age, gender and nationality. These reports are being utilised by health planners and policymakers to address the importance of cancer problem, allocate resources and to evaluate cancer prevention and control activities.

Source of population
Medium projections based on the 2001 census. Central Informatics Organization.

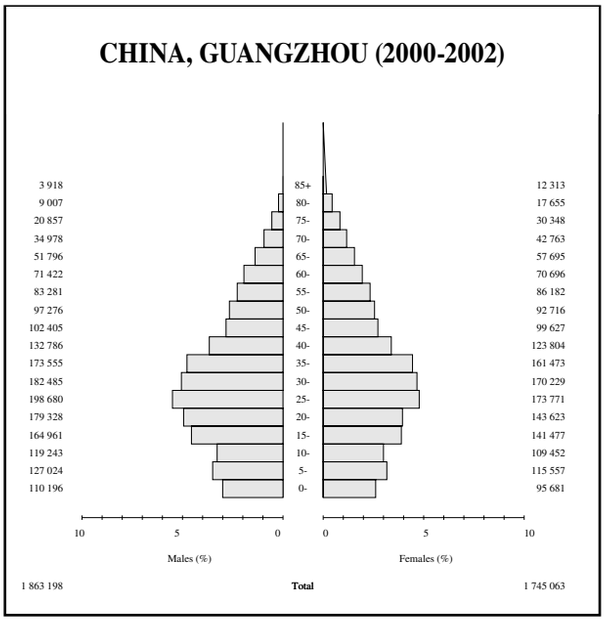
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

China, Guangzhou City

Registration area
Guangzhou is the largest city in southern part of China, with a population of about 7.25 million and an area of 7434.4 km^2. It is the capital of Guangdong province and is situated at latitude 22°N and longitude 112°E.

The Guangzhou Cancer Registry covers the population of seven districts (central urban area) within Guangzhou city with an area of 1335.3 km^2. The population was 3 560 810 in 2000, with people of the Han race making up more than 99%.

Cancer care facilities
The Cancer Centre in Sun Yat-sen University is one of the largest cancer centres in China. It has more than 1000 beds and employs 1300 people. More than 40% of the cancer patients in Guangzhou are diagnosed and treated in the centre. There are national, provincial, municipal and district hospitals in Guangzhou, which provide radiotherapy, cancer surgery and chemotherapy services for cancer patients.



Registry structure and methods
The registry is located within the Cancer Center, Sun Yat-sen University and is funded partly by the cancer centre and partly by the Guangzhou Health Bureau. There are 7 registrars in the registry.

Physicians and medical clerks in the hospitals of the registry area are responsible for filling out a report card for each newly diagnosed cancer patient. Each hospital has a special department to collect, check and send the cards to the registry on time. The quality of this work is checked by the Guangzhou Health Bureau as a part of the medical quality control service in each hospital. The registry staff also periodically goes to review the patient records in all hospitals that are located in registry area in order to control report quality.

The registry staff check, code and file the cards according to year, sex, usual residence, ICD code, etc. Then the registry staff determines whether a patient has already been reported to the registry, so as to avoid duplication.

Interpreting the results
Guangzhou has a full range of diagnostic facilities, so that it is unlikely that cases referred will be missed.

Screening service for cancer was not operated in Guangzhou in the period 2000–2002. PSA testing is not common in our population, being only carried out in urology departments of some hospitals.

Use of the data
Cancer incidence and mortality data are provided to the Guangzhou government as a reference for planning projects in cancer prevention and control. The registry has also carried out some epidemiological studies based on the data from Guangzhou.

Source of population
Projections based on 2000 census.

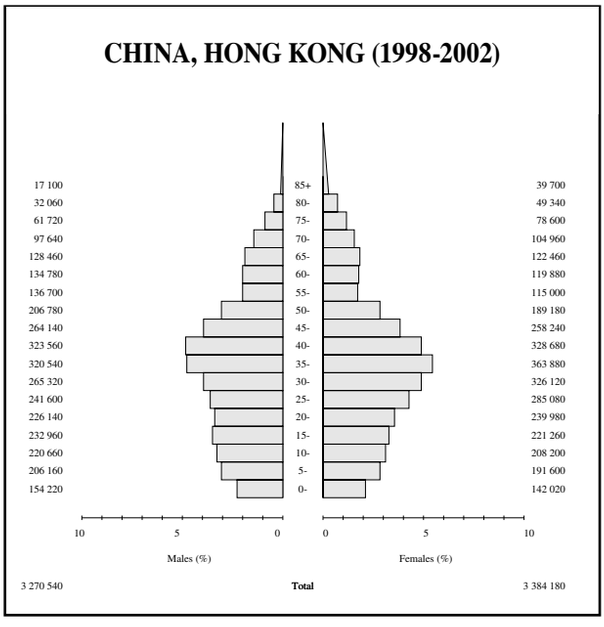
Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

China, Hong Kong

Registration area
Situated in the south-eastern part of China, Hong Kong is one of the most densely populated places in the world with an average population density of 6,140 persons per km^2. The population was about 6.78 million in mid-2004. About 93% are Chinese, mostly descendents from people of the Guangdong Province in southern China. Hong Kong Cancer Registry covers the entire population of the area.

Cancer care facilities
The Hospital Authority (HA) is a statutory body to manage all public hospitals in Hong Kong. Clinical Oncology is a discipline of medicine that manages cancer patients by non-surgical means such as radiotherapy, chemotherapy, biological therapy and palliative care. There are currently six Clinical Oncology centres in the Hospital Authority. A few private hospitals also provide similar services.



Registry structure and methods
The Registry is an official and professional body for population-based data collection in cancer epidemiology. It is currently run by one statistical analyst and four clerks in the Department of Clinical Oncology of Queen Elizabeth Hospital, Hospital Authority. The director is a specialist in Clinical Oncology who, apart from overseeing operations, provides regular input on the validity of clinical data.

The Registry obtains data through electronic means directly from clinical oncology centres, pathology laboratories and hospital discharge summaries of all public hospitals. For the private sector, the Registry has had a good working relationship with most cancer centres and pathology laboratories over the years. Near-complete coverage can be achieved within the territory. Voluntary notification nowadays contributes very little to the data pool. Death certificates are obtained from the Department of Health.

Cancer notification is by administrative order without a specific law in Hong Kong. The privacy of the cancer patient and the use of the related information are protected by the Government's Personal Data (Privacy) Ordinance. There is no personal contact with cases or patient follow-up by the registry staff.

The Registry evaluates the quality of incoming and output data using both automatic and manual review processes. Histological verification percentage (HV%) is one of the two internationally accepted indicators of data quality in cancer registries, and we achieved over 85% confirmation in recent years. Death certificate only percentage (DCO%) is the other indicator. Our completeness in data collection is illustrated by the very low DCO% of 1.5% in 2003 against 7.6% in 1990.

The only organised mass screening programme (by Health authorities) is cervical cancer screening; PSA testing is not common in the population covered.

Expanding the scope of data collection
Information Technology in Hospital Authority (HA) has contributed significantly to the Registry in recent years. The Registry was linked up with the Electronic Patient Record (ePR) System of HA in 2004. Since then, the registry has been able to collect histological data and staging information more comprehensively and easily.

On the other hand, death data are collected from the Death Registry of the Government. Previously death records other than cancer were not available to the registry because of legislative restrictions. The individual case record obtained was anonymous and without the unique identity number. Therefore survival analysis has not been part of the output of the registry. Since 2000 the death data has been linked with the Registry data, which helps minimise loss of patients to follow-up. The Registry can thus target compilation of a population-based survival analysis in the near future.

Use of the data
The Registry updates annual reports of cancer incidence and mortality in electronic format on its website. Basic descriptive epidemiological analyses are included. Registry data are routinely used by officials, health professionals, cancer control groups and the public. The data are also extensively used by local researchers for various epidemiological studies.

Source of population
1998–2000, 2002: Mid–year estimate produced by the Government's Census & Statistics Department.
2001: Population Census data produced by the Government's Census & Statistics Department.

Multiple primary rules used
Impossible to detect multiple primaries.

Notes on the data
For this registry, only ICD–9 3 digit categories were available.

China, Jiashan

Registration area
Jiashan County is located in the north of Zhejiang province, near Shanghai City. It is at latitude 30° N and longitude 120° E. The area of Jiashan County is about 506.6 km²; 14.3% of the county is covered by rivers and lakes. The average annual temperature is around 16° C.

Jiashan County is covered by flatlands with a network of waterways. About 80% of the population lives in rural areas. Population density in the county is 751 persons per km². Agriculture is a major industry, and the main crops are rice, wheat and broad beans. The county once had a serious schistosomiasis epidemic, but the disease was eradicated in 1985.

Cancer accounted for 23.8% of all deaths in 1997.

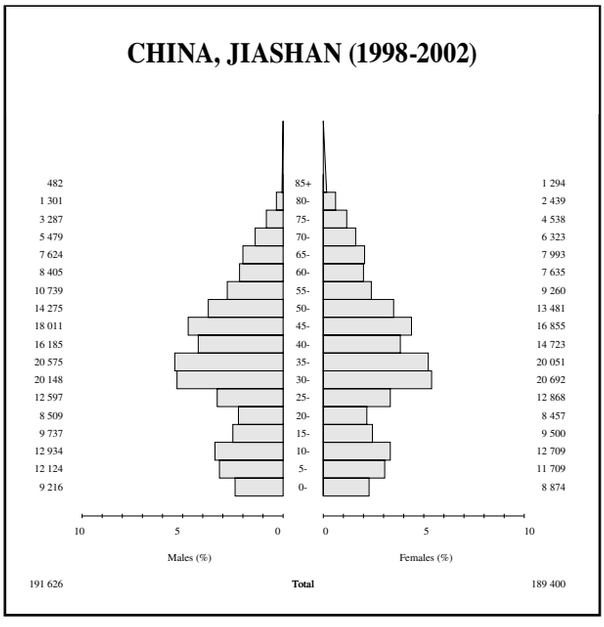
Cancer care facilities
There were 24 medical establishments, 1296 medical workers and 1135 hospital beds in the county at the end of 1997.

Registry structure and methods
A population-based cancer registry was established in Jiashan County in 1987, according to documents of the Jiashan County Government and Health Bureau on reporting cancer incidence and mortality, and mortality from all causes. It is attached to the Jiashan Institute of Cancer Research.

In accordance with Jiashan County Health Bureau regulations, all medical establishments, whether hospital or clinic, must report new cases of cancer diagnosed, including benign tumours of the central nervous system, and cause of death for all diseases.

Physicians in healthcare departments of medical establishments in the county towns are charged with collecting report cards on cancer, which are completed by doctors in each ward and diagnostic service. Doctors of preventive medicine in the rural area hospitals collect cancer cases in each village and filling in report cards. All the cards are sent to the cancer registry. After receiving the report cards, the doctors in the cancer registry check details by phone or by going to the source. Multiple cards on the same patient are merged, and cards for non-resident patients are removed. Physicians working in the cancer registry visit the medical establishments several times a year and inspect the reporting of cancer cases to assess quality and completeness. A meeting is held at the end of every year, with officers of the county health bureau, to discuss problems encountered in order to improve quality.

In 1991, two computers were purchased. Software for vital statistics and cancer reporting, produced by the Sanitary and Anti-Epidemic Station of Liaoning Province and recommended by the National Cancer Research and Control Office, was adopted.



Use of the data
Data on cancer incidence, prevalence and mortality by sex, age and site are used in cancer prevention and treatment and for research into etiology.

Source of population
The sex and age distribution of the population 1998–1999 was estimated by interpolation based the sex and age distributions of the 1990 and 2000 census populations. The sex and age distribution of the population 2001–2002 was estimated by extrapolation based on the sex and age distribution of the 2000 census population.

Multiple primary rules used
IACR rules (2000).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

China, Nangang District, Harbin City

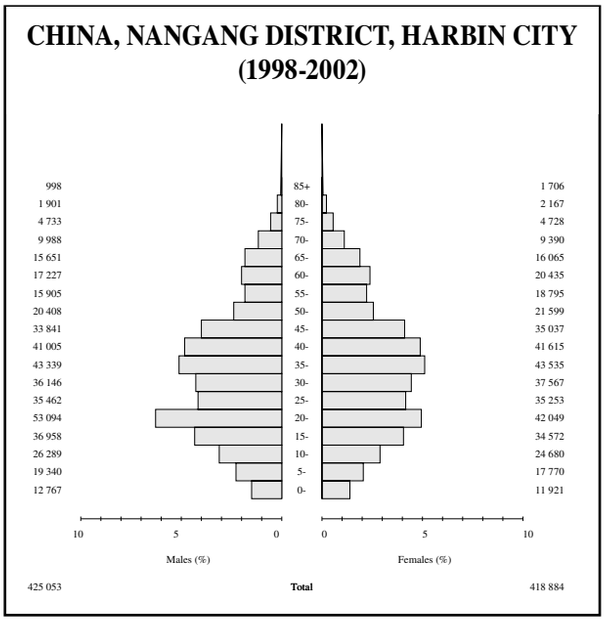
Registration area

Nangang district, located in the centre of Harbin, is the largest canton in Harbin and borders on the Daoli, Daowai, Xiangfang, Dongli and Pingfang districts. It lies within longitude 125º42' and 130º10'W, and latitude 44º04' and 46º40'N. It has a temperate zone continent/trade wind climate, with an average monthly rainfall of 38–68mm and average annual humidity of 65%. The total area of the district is 182.87 km^2, including an urban area of 60 km^2, which is one third of the total area of Harbin.

The population of Nangang is 1 001 377 persons, of which 90% are Han. The rural/urban breakdown is 61 146 and 940 231 persons respectively.

Cancer care facilities

The following diagnostic facilities are available in the area: clinical, surgical, pathology, radioactive x-ray, supravital, CT scan, bone marrow aspiration and autopsy. Chemotherapy, radiotherapy, surgery, Chinese medical science and immunization are the treatments available to the community.



Registry structure and methods

The Harbin cancer registry office was established in 1997, comprising the people of Nangang district, which includes 18 community offices in 3 counties and 1 town. It is located in the chronic faculty of the Nangang disease prevention and control centre, with the supervision of the Nangang board of health. The office is in charge of the registration and reporting of newly acquired malignant tumours and carcinoids of the central nervous system among permanent residents in the district. The administrative obligatory report system is used in the office. The office now has 2 full-time and part-time clerks.

All personnel providing health care at all levels in Harbin are required to complete a report card and submit it to the supervising epidemic prevention station if they diagnose a malignant tumour. Malignant tumour death reports are to be submitted with data on the cause of death.

All healthcare personnel are also required to complete the death report card as well as the medical certificate of death. At present, follow-up visits are limited to tumour death cases, and family doctors in the community health service centre complete the tumour follow-up table. This measure has been in place for three years. The Nangang district includes 1 tumour professional hospital, 6 large polyclinics, and 109 medical units in 23 medium-sized polyclinics. The tumour report cards are catalogued according to administrative area, pinyin and kinds of diseases and after coordination and elimination; they are coded according to the international disease classification ICD-10 and reserved in the tumour cards tank. Computers manage and analyse the data, and all tasks of the registry office are now computerised.

Use of the data

Data accumulated through the years have been used in epidemiological research, cancer trend prediction and research on cancer control policies and counter-measures. Since the tumour reporting system was established in 1997, we have accumulated malignant tumour occurrence and death data from 1990 to 2001 in Nangang district. These data play a vital role in tumour prevention and treatment as well as scientific research, and have been used in 10 articles published in *China Fundamental Medical Care, Public Hygiene* and *Management of China Public Hygiene*. In the framework of the "Ninety-Five" National Science and Technology Innovation Programme, we have submitted basic and statistical data of tumour registration reports to some relevant faculties. Malignant tumour occurrence and death data from 1990 and 1992 were published in the book *The Occurrence and Death of Malignant Tumor in Experimental Cities in China*.

Data on tumour occurrence and death during 1993 and 1997 in Nangang district have been constantly used by *Malignant Tumor Occurrence and Death* (93-97 volume) of 11 experimental cities around the country; occurrence and death data during 1998 and 2002 have been used in the compiled book of volume. The data are an important component of the project *The Research of Common Malignant Tumor Occurrence, Death and Dangerous Factors Monitoring Method*, which is the product of many years of hard work; it will be of vital importance in future cancer control projects, hygiene projects, hygiene cause planning, and investigations of cancer prevalence.

It is believed that with time, these data can play more important roles. With support from health policy leaders at various levels, and with continued effort from the staff, the Nangang tumour registry office can be expected to achieve greater coverage and completeness, and will contribute richer and more accurate data for cancer prevention and control in the future.

Multiple primary rules used

Impossible to detect multiple primaries.

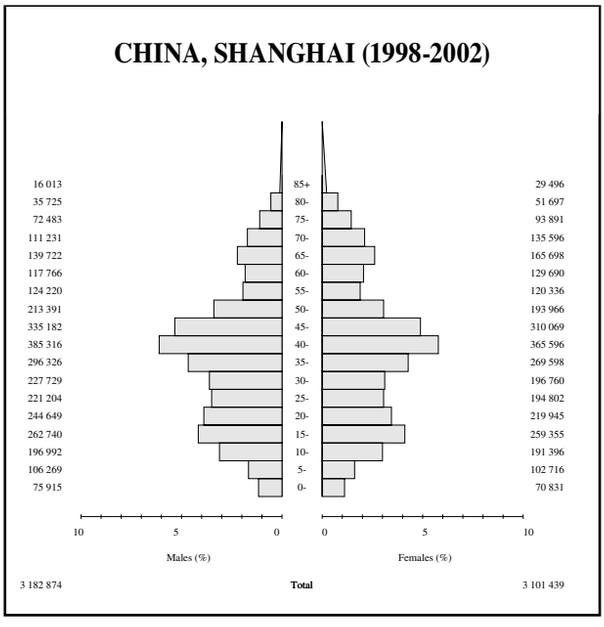
China, Shanghai

Registration area

Shanghai is situated on the east coast of China at 31°14' N latitude and 121°29' E longitude. The total area of Shanghai Municipality is 6340.5 km^2. There are about 13.52 million inhabitants in the municipality. The registration area during 1998–2002 covered nine urban districts with an area of about 289.4 km^2 and 6.19 million inhabitants, 99.1% of whom are Han Chinese. Ninety-five percent of the population are non-religious; the other 5% are Buddhists, Taoists, Islamites and Christians. Most of the population is immigrants from all over China, mainly from neighbouring Zhe Jiang and Jiang Su Provinces.

Cancer care facilities

Shanghai has a 3-level general health care network, including more than 400 hospitals and community health service centres. The first-level facilities are all the community health service centres providing predominantly primary health care. The second-level facilities are the district hospitals, most of which have a Cancer Department. The third-level facilities are all the municipal hospitals and the Shanghai Cancer Hospital. Most of the second- and third-level facilities provide radiotherapy, cancer surgery and chemotherapy services.



Registry structure and methods

Organisation of the Shanghai Cancer Registry is now based upon a 3-level network of disease prevention and control. The first level is the Registry of Shanghai CDC. The staff of this level consists of 2 senior and 3 junior epidemiologists, 2 statisticians and 1 assistant statistician. The second level consists of CDCs in 19 districts. In each district CDC, 1–2 epidemiologists and 1 assistant are responsible for cancer registration. The third level consists of 207 community health service centres. There are 1–2 workers responsible for home visit and data checking; most of them are community GPs.

Shanghai Cancer Registry is a population-based cancer registry that collects, analyses and disseminates information on cancer incidence, mortality and survival in the Shanghai urban area. The registry was established and started operating in 1963. The registry became essentially population-based by 1972, and complete incidence and mortality data for the urban area in Shanghai Municipality are available from 1973 onward. The registry was operated by the Shanghai Cancer Institute before 2002, when it moved to Shanghai Municipal Centre for Disease Control and Prevention.

All second- and third-level medical facilities (about 170 units) in Shanghai are responsible for notifying all newly diagnosed cancer cases and cases of benign tumours of the central nervous system to the registry. A standardised notification card, which includes demographic information, cancer site, date and basis of cancer diagnosis, is used for reporting cancer cases. The notifications are sent to the cancer registry and filed according to the name of the patient and administrative district of residence. Home visits are carried out for every case to confirm if the cancer patient is a permanent resident. All patients residing outside the registration area are deleted from the cancer registry.

Data on cancer notification cards are computerised using specially-designed computer software that directly reads Chinese characters. Cards with similar contents are examined by registry staff and duplicates are deleted.

Death certificates for all cancer patients are obtained monthly from the Vital Statistics Section of the Shanghai Municipal Center for Disease Control and Prevention and collated with the file of new cases kept in the registry. If the deceased was not registered prior to death, the registry staff interviews the relatives of the case to obtain information on the hospital where the case was diagnosed and treated, date and basis of cancer diagnosis.

Interpreting the results

For a long time the Registry collected information on new cancer cases only in the urban area, and in suburban and rural areas of Shanghai collected information only on cancer deaths. The urban area expanded from 159 km^2 to 289 km^2 over the past 30 years, and the population increased from about 5.7 million to 6.3 million.

In the past 30 years the number of hospitals responsible for cancer cases increased from 117 to 175 in Shanghai. Shanghai is one of the areas with the highest level of cancer diagnosis and treatment in China. Almost all of the cancer patients in urban area covered by our Registry are diagnosed and treated in those hospitals.

A mass screening programme on cervical cancer with Pap smear examination began in urban Shanghai in the late 1950s. All employed women have a Pap smear every 2 years, provided by local maternal hospitals and paid for by both the government and the employer. Almost all of the hospitals in Shanghai can provide PSA testing when necessary, but there is no mass PSA testing programme screening for prostate cancer.

The anatomic sites of cancer cases were coded using both ICD-9 and ICD-10 from 1998 to 2001 and using only ICD-10 since 2002. The histology and behaviour have been coded using ICD-O-2 since 2002.

Use of the data

The registry provides a Shanghai Cancer Report annually to the government, institutes and hospitals. The report

helps to establish cancer prevention plan and policy. The report also provides basic cancer information to support community cancer control and prevention activities, such as community-based cancer patient care services. More than 20 case–control and cohort studies have been conducted in the past 30 years using Shanghai Cancer Registry data.

Source of population
1998, 1999: Interpolated by the sex and age distribution of the population of the 1996 and 2000 census data. 2000: census. 2001, 2002: Extrapolated by the sex and age distribution of the population in the 2000 census.

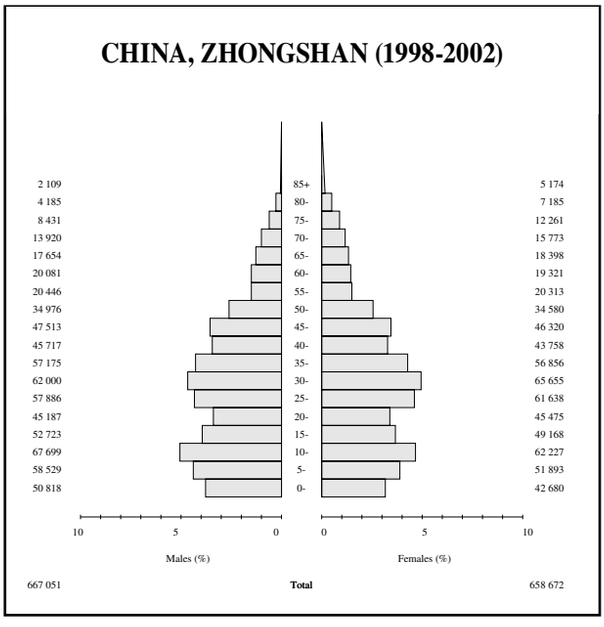
Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation). This registry has the lowest histological verification rate in the monograph.

China, Zhongshan

Registration area
Located at the mid-southern part of Canton in the hinterland of the Pearl River delta, the Zhongshan cancer registry covers 1683 km^2 and includes the population of 24 towns and districts. In 2000, the population of Zhongshan was 1 360 302, about 45% of whom lived in urban areas. Most Zhongshan residents practice Buddhism, Daoism, or Christianity.

Cancer care facilities
The city hygiene bureau, through all kinds of hospitals, clinics and the CDC, provides health care in Zhongshan. Private practitioners are relatively few in the region. Although there are not any independent cancer centres or hospitals in Zhonghsan, several large comprehensive hospitals have cancer departments that provide surgery and chemotherapy service for cancer patients. Only the Municipal People's Hospital has radiotherapy facilities, to which all cancer patients in Zhongshan are referred when radiotherapy is necessary. For differing reasons, some cancer patients will go to hospitals of neighbouring cities such as Guangzhou for diagnosis or treatment.



Registry structure and methods
The Zhongshan cancer registry is affiliated with Zhongshan People's Hospital, and is funded by the hospital and the municipal and provincial health departments. One full-time medical officer and two full-time registrars staff the registry. Each hospital in Zhongshan has a part-time registrar to help collect cancer data and to follow up cancer patients.

Passive and active registration methods are used in Zhongshan cancer registry. The active case finding method is the major means of finding new cancer cases, as more and more doctors do not notify cancer cases on their own initiative.

The registrars identify cancer cases from all possible sources, such as medical record departments, pathology departments, bone marrow test laboratories, radiotherapy departments, the death registry, etc. All cancer data are collected and sent to Zhongshan cancer registry, where an experienced registrar first checks the data to see if it is a duplicate case, is missing any important items or has any logic mistakes. If everything is acceptable, the cancer data are coded and entered on computer for storage and analysis, and the notifying card is stored in the data room. If not, the data are traced back to correct or complete the faulty or missed information.

Arrangements are also made with the hospitals outside the registration area to notify the registry of any resident cancer cases that they diagnosed or treat; they are visited once a year to review these procedures. Data are evaluated according to the IARC and the Cancer Prevention and Treatment Office of China rules.

Interpreting the results
Theoretically all cancer data should be reported to Zhongshan cancer registry if all cancer patients go to hospitals for diagnosis and treatment. But some patients do not want it known they are ill with cancer, and use a false address or name; these patients are very often missed. Some foreign cancer patients use the local address when asked to provide their place of residence, which results in the cancer patient being mistakenly identified as a native cancer patient.

As Zhongshan is one of the areas with high incidence of and mortality from nasopharyngeal cancer in China, in 1986 we screened more than 42 000 natives aged 25–65 in 16 of 34 towns in Zhongshan using EBV VCA/IGA and EA/IGA immuno-enzyme serological tests; most of them were followed up until 2000.

PSA testing is part of routine hospital checkups, and almost every hospital in Zhongshan provides it.

Before 1990, liver trematode disease, cirrhosis and bile duct cancer were very common in Zhongshan due to special fish breeding methods and the local diet that includes uncooked fish meat. Since then fish breeding methods and the habit of eating uncooked fish meat have changed, and the incidence of those diseases decreased greatly. In recent years, with the progression of industrialisation, urbanisation and heavy transportation, environmental pollution has worsened, which may influence cancer incidence and mortality in Zhongshan.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. Some special studies of survival of registered cancer cases (nasopharyngeal and lung cancer) have been carried out, and we are now collaborating with Queen Mary Hospital of Hong Kong to explore new serological screening tests of nasopharyngeal carcinoma. Zhongshan policymakers are paying increased attention to health problems, and refer to our cancer registry data when making health policy.

Source of population
The age group proportion of 2000 was obtained through census. Other population data were estimated accordingly.

Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Cyprus

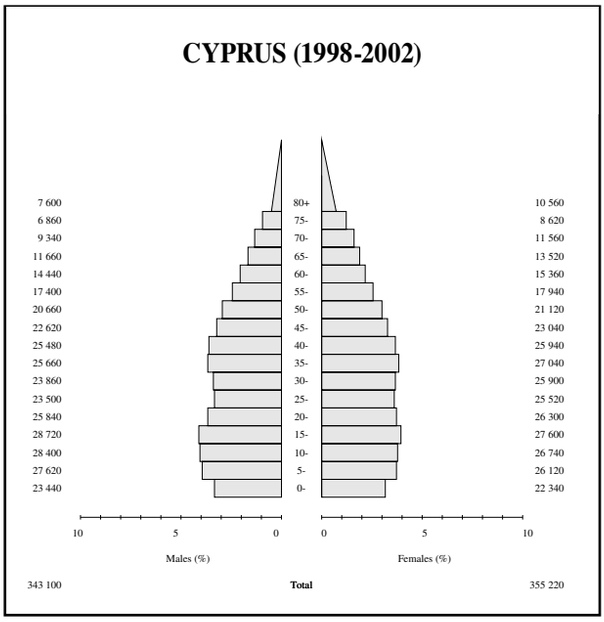
Registration area
The Cyprus Cancer Registry covers the population of five districts (Nicosia, Limassol, Larnaka, Paphos and Famagusta). The population in the government-controlled areas was 715 100 in 2002.

Cancer care facilities
General health care in Cyprus is provided by both the Ministry of Health through the district hospitals and the primary health care centres and through the private sector. The Bank of Cyprus Oncology Center, a non-profit organisation funded by the Government provides healthcare services to cancer patients. The services provided at the oncology centre include radiotherapy, chemotherapy and hormonotherapy.

Registry structure and methods
The Registry is co-funded by the Ministry of Health and the Middle East Cancer Consortium (MECC). Its main offices are located within the Ministry of Health. It comes under the supervision of the Chief Health Officer and it is staffed by three full-time registrars.

The Cyprus Cancer Registry (CyCR) uses active case finding from various sources, mainly (a) general hospitals' in-patient records, and inpatient and outpatient facilities in each district, (b) the bank of Cyprus Oncology Center, (c) the private sector hospitals inpatient and outpatient facilities, (d) pathology laboratories, (e) haematology laboratories and (f) cytology department. The death registration system is inadequate and incomplete for the time being. A restructuring of the death registration system is currently underway.

The registry staff visits all sources and scrutinises the records kept in the medical records departments and registers of individual departments concerned with diagnosis and treatment of cancers, in order to identify and abstract information on cases of cancer diagnosed by all methods among residents of the registry coverage area. Cancer is not currently a notifiable disease in Cyprus.



Interpreting the results
Estimation of the completeness and accuracy of data is performed by external quality control group. A breast cancer screening program has been operating since 2003; screening is provided by the Ministry of Health free of charge to all women between the ages of 50–69.

The data provided in Volume IX includes all foreigners registered in the CyCR, which is not the case in our cancer report.

Use of the data
The Registry prepares a triennial report of cancer incidence, highlighting trends and changes.

Multiple primary rules used
IACR rules (2000)

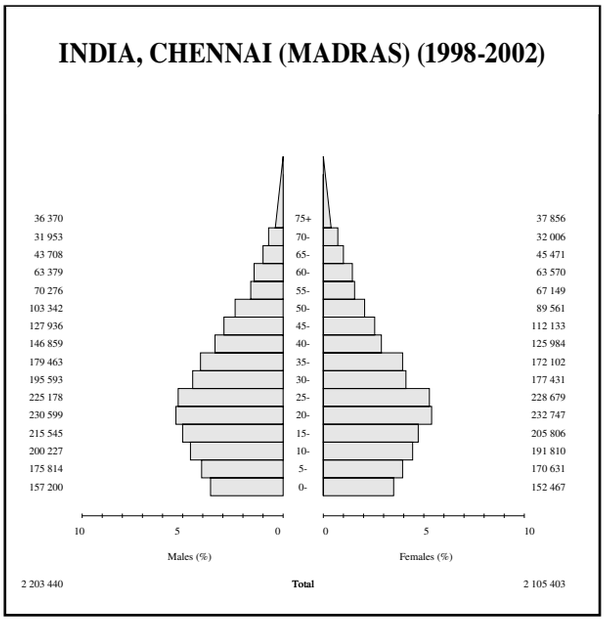
Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

India, Chennai (Madras)

Registration area

The Madras Metropolitan Tumour Registry (MMTR), a population-based cancer registry, was established at the Cancer Institute (WIA) in 1981 in the network of the National Cancer Registry Programme (NCRP) of Indian Council of Medical Research, New Delhi, to study patterns and trends in cancer incidence and mortality in Chennai City (formerly Madras). Data collection commenced 1st January 1982.

The city of Chennai is situated at sea level on the Coromandel coast of peninsular India at latitude 13.04° N and longitude 80.17°E. The MMTR caters to an area of 170 km^2 and a population (entirely urban) of 4.3 million (957 females to 1000 males) as on 1st March 2001, constituting 0.4% and 7.0% of the total population of India and the state of Tamil Nadu respectively. The decadal population growth rate during 1991–2001 was 13.07%, and the population density was estimated to be 24 964 persons/km^2. The literacy rate is 85% (M: 90%; F: 80%) and the predominantly spoken language is Tamil. The majority are Hindus (82%) followed by Muslims (9%) and Christians (8%), with the rest belonging to other religious groups (1%).



Cancer care facilities

General health care, including cancer diagnostic and treatment facilities, is provided by the government health service, the Cancer Institute (WIA), which is a Regional Cancer Centre in Ministry of Health and Family Welfare, Government of India and supplemented by private practitioners and hospitals. The Radiation Oncology division at the Cancer Institute (WIA) is one of the best equipped centres in India. Radiation facilities are also available in four Government and five private hospitals. Surgical and Chemotherapeutic services are offered in government and private hospitals and nursing homes.

Registry structure and methods

The MMTR, besides a Principal Investigator, comprises a medical officer, two statisticians, a computer programmer, ten social workers and a data entry operator. Cancer is not a notifiable disease in India; therefore registration of cases is done actively.

The registry continues to enjoy good cooperation from all healthcare facilities in and around Chennai, with more than 225 sources of registration to date: government and private hospitals, nursing homes, clinics, consultants, pathology laboratories, imaging centres and hospices.

The Social Scientists of the registry visit the collaborating hospitals regularly and collect data on cancer by interviewing the cases wherever possible and/or medical records. Deficient medical records are updated via linkage of data collected from various departments within a hospital for completeness of details.

Mortality information on all deaths occurring in the city, irrespective of the cause of death stated on the death certificate, is collected from the Vital Statistics Division (VSD) of the Corporation of Chennai.

Management of data has been progressively computerised to minimize the manual work, resulting in the enhancement of data quality. Reliability of data and quality of registration are constantly monitored, with emphasis on re-abstraction and coding on a random sample of cases and case finding. Validity checks are done using IARC, NCRP and other in-house developed computer programs.

Interpreting the results & use of the data

The completeness of registration of cancer cases in MMTR is estimated to be 96%. Cancer information is disseminated by publishing periodic reports and descriptive epidemiological studies on cancer incidence and mortality highlighting the trends and patterns.

MMTR has been the pioneer in many registry-related activities in India: systematic trace-back of death certificate notifications, active follow-up of registered cases, collection of mortality data and survival analysis of top ten cancers.

A new registry known as the Dindigul Ambilikkai Cancer Registry, covering a population of 2 million, was started in 2004 to provide reliable data on cancer incidence in rural area and to evaluate the randomised field intervention trial on cervix cancer under the auspices of the International Agency for Research on Cancer, France.

MMTR provides data to the ICMR project on "Development of an Atlas of Cancer in India". It is also involved in a population-screening program on cancers of the cervix, breast and oral cavity that is conducted by the Cancer Institute (WIA) in the neighbourhood.

Source of population

Estimated for 1998–2000 & projected for 2001 & 2002. Population estimates by five-year age groups according to sex by difference distribution method using exponential growth rate between 1991 & 2001 census populations of Chennai city. Census of India 1991. Socio – Cultural Tables Vol. I Series 23, Tamil Nadu, Part IV A – C Series. Directorate of Census Operations, Tamil Nadu 1997. Census of India 2001. Report and Tables on Age. Tamil Nadu, C–14 Series. Directorate of Census Operations, Tamil Nadu 2005.

Multiple primary rules used

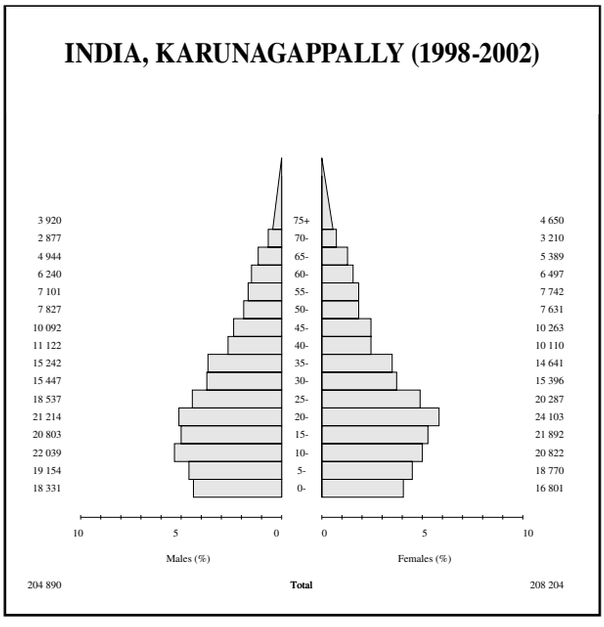
IACR rules (2004) on CI5 IX period.

India, Karunagapally

Registration area

The Cancer Registry Karunagapally, India is located in the Kollam District of Kerala, situated around 9° N latitude and 77° E longitude. The area is rural as per census definition; geographically, it is lowlands with backwaters and coastlines. The Registry area covers 212 km^2 (land area 193 km^2) covering the total taluk of Karunagapally with a population density of over 2000/km^2. The coastal belt of this taluk is known worldwide for its rich deposits of rare earth mineral sands containing radioactive materials, mainly thorium. About 100 000 people are constantly exposed to this radiation. Population is more or less stable, and the majority are agricultural labourers, fishermen, coir labourers, etc. 99% of the people live in rural areas and 1% in semi-urban area. Births & deaths occurring in the Panchayats are registered in the respective Panchayat offices.

The three major religions are Hindus, Christians and Muslims. The population at the 1991 census was 383 514 (189 647 males and 193 867 females). There has been no change in area or population covered by the registry since its initiation in 1990.



Cancer care facilities

Health Care Services in Karunagapally taluk is provided mainly by State Health & Family Welfare Department through a Taluk Headquarters Hospital, 12 Primary Health Centres and few sub-centres. There are several Private Hospitals and Medical Practitioners in the area.

Regional Cancer Centre in Thiruvananthapuram located 100 km away and Alappuzha Medical College Hospital 65 km away are the two nearest cancer treatment centres offering cancer care and treatment facilities.

There are no cancer detection facilities or dedicated cancer treatment facilities in the area except cytology detection facilities, pain clinics and supportive clinics offered by the registry with the technical help of Regional Cancer Center, Thiruvananthapuram. There are no added diagnostic facilities like PSA testing in this area, and the only regular screening procedure available was Pap smear screening programs.

Registry structure and methods

Regional Cancer Centre, the comprehensive cancer treatment centre of Kerala, started Cancer Registry, Karunagappally as a special purpose registry in 1990. The Registry's main objective is to study cancer occurrence and its relation to the natural radiation present in the sea coast of Karunagappally taluk. The registry office is located in Neendakara. The study and the Registry were initiated in 1990 with the support of Department of Atomic Energy, and since 1999 it has continued with funding from Health Research Foundation, Japan & Local Area Development fund, Government of Kerala. Registry staff includes one Research Officer from RCC, 6 Field Investigators, 3 Data Processing Assistants and one Statistician.

We adopted active cancer case finding method for Cancer Registration, as cancer is not a notifiable disease here. The field investigators scrutinise medical records of several hospitals to locate cancer cases. More than 60 sources including Regional Cancer Centre, Medical College Hospital Thiruvananthapuram, District Hospital Kollam and Taluk Hospital and other Government hospitals in Karunagappally are visited regularly. Major private hospitals in the registry area and nearby Kollam town are also visited regularly for case finding. Further, records maintained by Pathological laboratories in Kollam District and Thiruvananthapuram and also of the Vital Statistics division of the local panchayats and Kollam Muncipal Corporation are scrutinised to locate cases from the panchayat. Investigators abstract cancer cases diagnosed by all methods among residents of the registry area. Medical Practitioners give details about the cancer cases seen in outpatient clinics. Systematised field visits are done in the registry area to locate these cases. Death registers are available in Vital Statistics Division of the panchayats but the information is not adequate for scientific purposes. We trace back all the deaths in the community through house visits and obtain relevant information about cause of death etc. Autopsies are extremely rare, restricted to medico-legal cases. The collected data are processed and computerised after duplicate elimination and checked for consistency using a computer programme. Regular evaluatory procedures are done to ensure accuracy of the registry data.

The radiation effects study has progressed from 1999 onwards based on a cohort approach. A radiation cohort with high radiation and a control cohort with low radiation exposure were selected, and the study was pursued with individual dose estimation and special surveys like migration, occupancy, and mortality for in-depth analysis and estimation.

Interpreting the results

The Registry office has a well-equipped cytology laboratory, and weekly detection clinics are run by the registry in Government Taluk Headquarters Hospital. This increased the microscopically verified percentage of cases. Cancer follow-up clinics, pain & palliative care services, field detection clinics and Pap screening programmes were organised by

the Registry in which doctors from RCC participated. Thus cancer cases diagnosed in this area will not be missed due to intensive casefinding methods including house-to-house visits in the registry area.

Use of the data
The main objective of the data is research on the effects of chronic exposure to the natural radiation. Cancer control measures and cancer patient services are developed in the registry area using the registry data. Studies are ongoing for population-based survival and mortality data analysis. The registry annually prepares reports on cancer incidence highlighting trends and changes.

Source of population
The Governmental census population data of 1981, 1991 and 2001 were available. The growth rate between 1991 and 2001 in rural Kollam was 7.99%, which was lower than the growth rate between 1981–1991 (10.68%). Age-specific census data of 2001 was not available for Karunagappally Taluk. The 1991–2001 growth rate was applied to each group of 1991 estimated Karunagappally population and using exponential growth rate, the population by age and sex as on July 2000 was obtained.

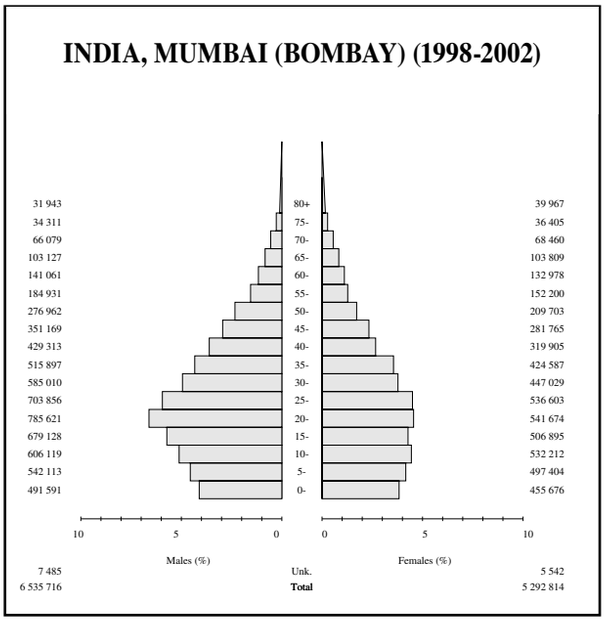
Multiple primary rules used
Impossible to detect multiple primaries.

India, Mumbai (Bombay)

Registration area
The Mumbai (Bombay) registry covers the resident population of Greater Mumbai, a densely-populated metropolis on the west coast of India, occupying an area of 437.7 km^2 between latitudes 18–19^0 N and longitudes 70–71^0 E. Greater Mumbai is in fact an island joined to the mainland by bridges, and has a warm, humid climate.

The population of Greater Mumbai as per 2001 census (1st March) was 11.9 million with a sex ratio of 811 females per 1000 males. It has a density of 2220 inhabitants per km^2, making it the most populated district in the country. The decennial growth rates of the population between 1991 and 2001 were in the order of 20.2. The literacy rate was found to be 87%.

The city is the industrial heart of India. As a result of continuing immigration it has multi religious and multilingual population representing every state in the Union, approximately 67.4% being Hindus, 18.6% Muslims, 3.7% Christians, 5.2% Neo-Buddhists and 3.7% Jains, 0.5% Parsis and 0.6% Sikhs.



Cancer care facilities
Municipal Corporation and State Government maintain the majority of hospitals in Mumbai and the major source of the data is the Tata Memorial Center, which is a postgraduate university teaching centre for cancer research. The City has five medical colleges. The diagnosis and treatment of cancer is centralised in certain hospitals. Major cancer surgery is undertaken in all the major hospitals and well-equipped private nursing homes. Facilities for cobalt–60 are available in 9 hospitals, while ulto-voltage deep x-ray therapy is available in 15 hospitals.

A total of about 30 000 hospital beds are available in the registration area. There have been improvements in diagnostic facilities, as new hospitals have immerged with histopathology and imaging facilities in registration areas. Radiotherapy departments have also increased from 2 to 9 hospitals. Chemotherapy is available in many new hospitals.

Registry structure and methods
The Mumbai cancer registry was established in June 1963 as a unit of the Indian Cancer Society with the aim of obtaining reliable incidence and mortality on cancer from a precisely defined urban population. Compilation of data began in 1964. Until then, no continuing activity on registration of cancer cases in a population had been undertaken in India. The registry started in collaboration with and up to 1975 received financial support from the Biometry branch of the US National Cancer Institute. During 1976–80 the registry received Financial support from the Department of Science & Technology, of the Government of India and the Indian Cancer Society. Since 1981–82, the registry has been funded in part by the Indian Council of Medical Research.

The registry staff consists of a Deputy Director who looks after the day-to-day administration, prepares research articles and annual reports, attends National & International conferences etc.; social investigators (12 involved in data collection); research assistants (6 Editing and Coding); two data entry operators; a programmer; an office superintendent and two attendants.

Information is obtained on all cancer patients registered in 160 Government hospitals/institutions and private hospitals/ nursing homes in Mumbai who are under the care of a specialist. General Medical Practitioners are not contacted individually as according to local practice. Only specialists assume charge of cancer patients in private hospitals and nursing homes, and even the few patients not admitted for hospital care are at some stage referred to a specialist.

Staff members of the registry visit the wards of all co-operating hospitals at least weekly to personally interview each cancer patient as well as those suspected of having cancer. All files maintained by the various departments of these hospitals are crosschecked individually. Care is taken to prevent duplication of an entry relating to a patient already registered.

With the exception of Tata Memorial Hospital for cancer, hospital outpatient records are not included in the registry files, because of the paucity of clinical details and the lack of specific information on the residential status of patients attending these clinics. Supplementary information is gleaned from the death records maintained by the Municipal Corporation.

The registry records follow-up information for almost all major sites.

Already we have carried out two special studies on the evolution of the completeness and accuracy of the data.

Interpreting the results
There are no screening programmes underway in the area covered. Tobacco chewing is very prevalent in both sexes. Smoking, particularly bidi, is prevalent in males but almost nil in females.

Use of the data
The registry publishes annual reports, and has published numerous journal articles and monographs. The data are also used by public health workers for etiological and cancer control studies. As the oldest registry in the country, the registry is a rich source of data for studying time trends in cancer incidence and mortality.

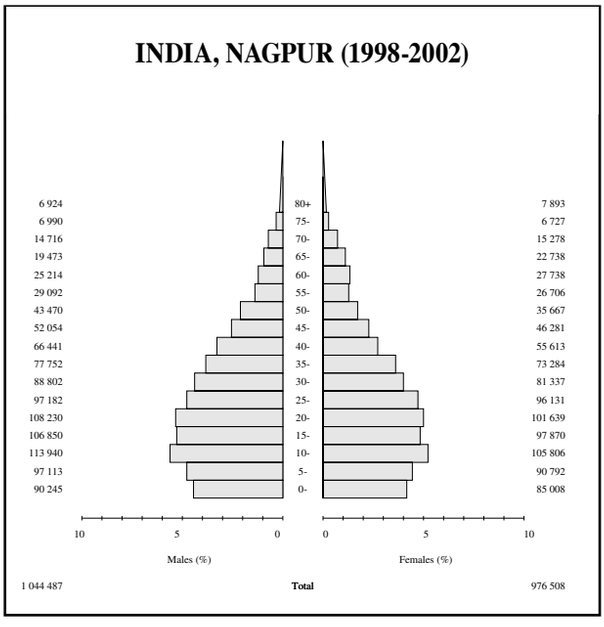
Source of population
Estimated using geometric rate of growth between census periods of 1991–2001.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

India, Nagpur

Registration area
Western Maharashtra, Vidarbha, and Marathwada are three geographical divisions of Maharashtra state. Nagpur city is the headquarters of the Vidarbha region. The city of Nagpur is located in the centre of the Indian sub-continent and is linked by air with all parts of the world and by rail and road with all parts of the country. Its configuration presents a unique combination of plateau, plain, hill and dale along the Nag Stream following West-East.

Nagpur city has extremely hot summers and moderately cold winters. The lowest temperature reaches to 3.9^{0}C in January and the maximum reaches 47.8^{0}C in May. The main precipitation occurs during the Monsoon, which begins around mid-June and lasts until mid-October. The average annual rainfall is about 1130mm. Nagpur city receives its water supply from the Ambazari and Gorewara tanks.



Nagpur lies on latitude 21°N and longitude 79°E. Nagpur city covers 236.93 km^2 with a population of 2.05 million (2001 Census). The density of population is 8660 per km^2, and the population is multi-religious, with 71.4% Hindus, 10.3% Muslims, 1.1% Christians, and 15.4% Neo-Buddhists.

Nagpur city is of historical importance. In mythology the god Ram traversed this region in route to the hermitage of Saint Shrutikrishna. He is supposed to have proposed on the Ramtek Hill, which has the name of Ramgiri, where a very beautiful "Meghdoot" was composed and written by the famous Sanskrit poet Kalidas. Buddhist ruins and archaeological remains show that this region was under-developed until the 18th century. Although it was ruled by the dynasties such as the Vakataka Rajputs, Rashtrakuts, the Parmars, and the Shails, the semi-aboriginal nomadic Gaolies also occupied it from the 6th to 16th centuries.

Cancer care facilities
Information is obtained on all cancer patients registered at the 10 major hospitals and 25 nursing homes in Nagpur, and from the Tata Memorial Hospital and other leading hospitals in Mumbai, as patients from Nagpur go there for treatment because of their excellent facilities. General medical practitioners are not contacted individually. Missed cases are checked via the death records maintained by Nagpur Municipal Corporation.

The 10 major hospitals in Nagpur City and 6 major hospitals in Mumbai contribute data to this registry. In all of these hospitals histopathology and imaging methods are available. In Nagpur there are two radiotherapy centres, and chemotherapy treatment is available in 5 hospitals.

Registry structure and methods
The Nagpur Cancer Registry division of the Indian cancer Society became operative on 1st January 1980, with the collaborative effort with Nagpur Medical College, with the aim of obtaining reliable incidence and mortality data on cancer from a precisely defined urban population.

Since its inception this registry has been financially supported by Indian Cancer Society, Mumbai. The staff of the registry consists of 4 Social Investigators (registrars are involved in data collection) and one supervisor (who looks after administration and completeness of data collection). Editing, coding and analysis are carried out at the Mumbai Registry Office where 1 coder and 1 DEO are involved.

Data are maintained on registry proformas and on computer files. Duplication of cases is checked via a comprehensive alphabetical index card system and by computer programmes. Data analysis is carried out at the Mumbai Cancer Registry. The registry does not record follow-up information.

Interpreting the results
There are no screening programmes underway in the area covered. Tobacco chewing is very prevalent in both sexes. Smoking, particularly bidi, is prevalent in males but almost nil in females.

Use of the data
The registry publishes reports every five years. The State Government also uses the data for district cancer control programs. The data are also used by public health workers for etiological and cancer control studies.

Source of population
Estimated using geometric rate of growth between census periods of 1991–2001.

Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

India, New Delhi

Registration area

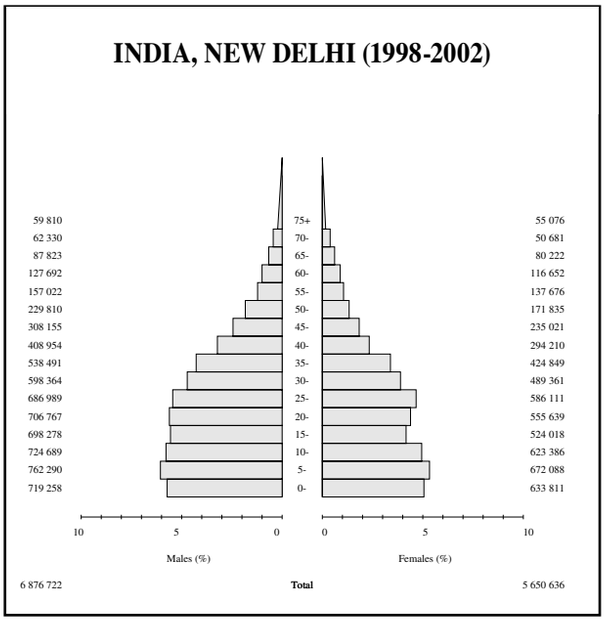
Delhi is a densely populated urban metropolis situated between the Himalayas and the Aravalli range in the heart of Indian sub-continent. It lies between 28° 25' and 28° 53' N latitude and 76° 50' and 73° 20' E longitude. It is surrounded on the north, west and south by Haryana and the east by the Uttar Pradesh.

The population census is taken every ten years in India, the last one being in 2001. According to the 2001 census the population in Delhi was 13 850 507 (Males: 7 607 234; Females: 6 243 273). The sex ratio in Delhi is 821 females per 1000 males. The density of population is 9 294 persons per km^2, versus 6352 persons in 1991.

The total population of Delhi UT as per 2001 census (as on 1 March 2001) was 12 819 761 (Males: 7 030 671; Females: 5 782 090). The sex ratio in Delhi UT Urban was 822 females per 1 000 males.

The total area of NCT of Delhi is 1483 km^2. Per the 1991 census, its rural and urban composition are 797.66 km^2 and 685.34 km^2 respectively. During Population Census 2001, the area of the NCT of Delhi remained the same at 1483 km^2. However, its rural-urban composition has undergone change. According to provisional results released by Directorate of Census Operations, Delhi, the rural-urban distribution of the NCT of Delhi is 591.91 km^2 and 891.09 km^2 respectively.

Since the population by age is available for Delhi UT urban areas only, it was therefore suggested that Delhi Registry may be defined for Delhi UT Urban areas only.



Registry structure and methods

The population-based cancer registry at Institute Rotary Cancer Hospital (IRCH), All India Institute of Medical Sciences (AIIMS), New Delhi was established in January 1986 with the aim of obtaining reliable morbidity and mortality cancer data among the Delhi residents.

The registry collects morbidity and mortality data on cancer patients from 159 major government hospital centres and institutions, more than 250 private hospitals and nursing homes, and the Dept. of Vital Statistics of the Delhi Municipal Corporation, New Delhi Municipal Committee and the Cantonment Board.

Staff working in Population Based Cancer Registry, Delhi, Dr. B.R.A. Institute Rotary Cancer Hospital, All India Institute of Medical Sciences, Ansari Nagar, New Delhi-110 029 are 3 scientists in statistics and medicine, 9 medical social workers, one data entry operator and one lower division clerk.

Although cancer is not a notifiable disease, arrangements have been made with the hospitals outside the registration area to notify the registry of resident cases which are diagnosed and treated in them; they are visited once a month or year to review these procedures. General medical practitioners are not contacted individually, as at one stage or the other almost all cancer patients are referred to specialists. The smaller nursing homes/clinics are contacted by letters and registration about cancer patients being treated by them are recovered on a per forma.

Medical social workers visit various collaborating hospitals and nursing homes and interviews the patients who are either undergoing cancer treatment or being investigated for cancer at radiotherapy department. They also examine the case records maintained by various departments of these hospitals, viz. Pathology, Haematology, Radiology etc. Many patients present at advanced stages of disease, and treatment may commence without waiting for the results of investigations. Therefore even cases diagnosed on the basis of clinical findings alone are also registered. All the information collected is cross-checked for completeness of the data. Sometimes the same patient may register in more than one hospital for treatment, so care has been taken to exclude duplicates.

The death registration system is very inadequate and incomplete; the cause of death often not mentioned or given as cardio-respiratory arrest. The registry staff visits these sources, where they scrutinise the records kept in medical records departments, and registers of individual departments concerned with the diagnosis and treatment of cancers, to identify and abstract information on cancer, diagnosed by all methods, among residents of registry area. These death records are then matched with the morbidity records. Cases not matching with the records are registered as Death Certificate Only cases (DCOs) in that corresponding year.

All the data collected were coded using ICD-O-1 and ICD-9. Inconsistencies in coding are corrected using quality check programmes. Validity checks are also carried out on all variables, and records with missing values and impossible codes were checked against the original files and corrected. Finally, a series of checks such as site versus sex and histology, sex versus histology, age, etc., were carried out to detect coding or keying errors.

Use of the data

The registry regularly prepares annual/biennial reports on cancer morbidity and mortality along with the cancer incidence, highlighting trends and changes. Case–control studies on gall bladder cancer and prostate cancer among the Delhi resident population have also been carried out. Some special studies on patterns of care and survival in breast, cervix and head and neck cancers are ongoing.

Source of population

The estimation of population for Delhi UT urban for the years 1998 to 2002 has been done exponential method by taking as a basis a 1981, 1991 and 2001 census figures.

Multiple primary rules used

ICD–O–1 (1980)

Notes on the data

The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

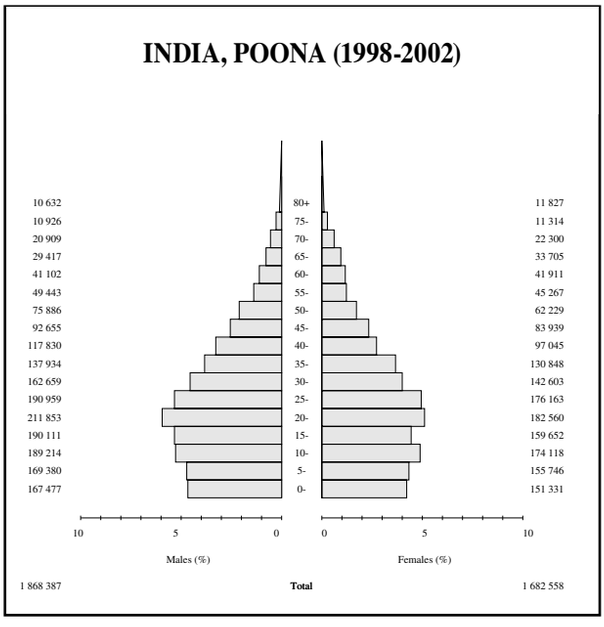
India, Poona (Pune)

Registration area

The Poona (Pune) is a district of Maharashtra lying between 17^0 & 19^0 N and 17^0 & 75^0 E. It has a dry and invigorating climate due to its attitude (487m) above sea level and the prevalence of westerly breezes. Its soil is free from alluvial deposits. The lowest temperature is 9^0C in January and maximum reaches 40^0C in May. Precipitation occurs primarily during the south-west monsoon, which begins around the middle of June and lasts until mid-October. The average rainfall is about 900mm. Poona city receives its water supply from Khadakwasala dam nearby.

The Poona city agglomeration covers 344.18 km^2 with a population of 3.55 million (2001 Census). The population density in 2001 was 10 330/ km^2, and the area supports a multi-religious group. According to 2001 Census, 79.7% are Hindus, 8.9% Muslims, 2.6% are Christians, 5.8% Neo-Buddhisst, and 2.2% Jains.

Poona city is of great historical importance. It was once the capital of the old Maratha Kingdom of Shivaji and Peshwas. It has been renowned for its educational facilities since the early part of the century. Being the district headquarters, medical and educational facilities are available in abundance, and many industries have been established in the city and its surroundings.



Cancer care facilities

About 10 000 hospital beds are available in the registry area. The Tata Memorial Center in Mumbai is the only specialised cancer institute in the India, and patients from Poona often seek treatment there. There are 35 major hospitals offering cancer diagnosis and treatment facilities in Poona.

There are 16 major hospitals in Poona City and 6 major hospitals in Mumbai that contribute data to this registry. In Poona and Mumbai hospitals, histopathology and imaging method are available. In Poona city there are 2 radiotherapy centres, and chemotherapy treatment is also available in 9 hospitals. In 1999, a specialised cancer hospital (Inlak Badharani) was established in Poona City.

Registry structure and methods

The Poona Cancer Registry, a satellite registry of the Mumbai Cancer Registry of Poona, commenced operations on 1 March 1972 as a collaborative effort with the B.J. Medical College and the Sasson hospital at Poona with the aim of obtaining reliable incidence and mortality data on a cancer in a precisely defined urban population. Since then, the Indian Cancer Society has provided financial support.

Registry staff includes 3 social investigators for data collection, and a supervisor who looks after administration and completeness of data collected. Editing, coding, analysis is carried out in the Mumbai Registry's office by 1 coder and 1 DEO.

Information is obtained on all cancer patients attending the 35 hospitals in Poona, and from the Tata Memorial Hospital and other leading hospitals in Mumbai where patients from Poona go for treatment because of the excellent medical facilities there. General medical practitioners are not contacted individually, according to local practice only. Specialists are in charge of cancer patients in private hospitals and nursing homes in Poona City. Even those patients not admitted for hospital care are referred to a specialist by the general practitioners at some stage.

The death records maintained by the Poona Municipal Corporation provide a means for checking on missed cases.

Staff members of the registry visit the wards of all co-operating hospitals at least once a week to personally interview each cancer patient, including those only suspected of having cancer. All files maintained by the various departments of these hospitals are also crosschecked individually. Editing, coding and analysis of data are carried out at Mumbai Cancer Registry. Data are maintained on computer files. Duplicates are sought using computer programs and a comprehensive alphabetical card index. No patient is followed-up directly by the registry staff.

Interpreting the results

There are no screening programmes underway in the area covered. Tobacco chewing is very prevalent in both sexes. Smoking, particularly bidi, is prevalent in males but almost nil in females.

Use of the data

A five-year report on cancer incidence and mortality is published regularly, and the seventh in this series is ready for publication. The data have also been used for special studies of cancer epidemiology. We report on extent of disease for all sites, and survival only for breast and cervix. District and state cancer control programmes also use this registry data.

Source of population

Estimated using geometric rate of growth between census periods of 1991–2001.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Notes on the data

The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

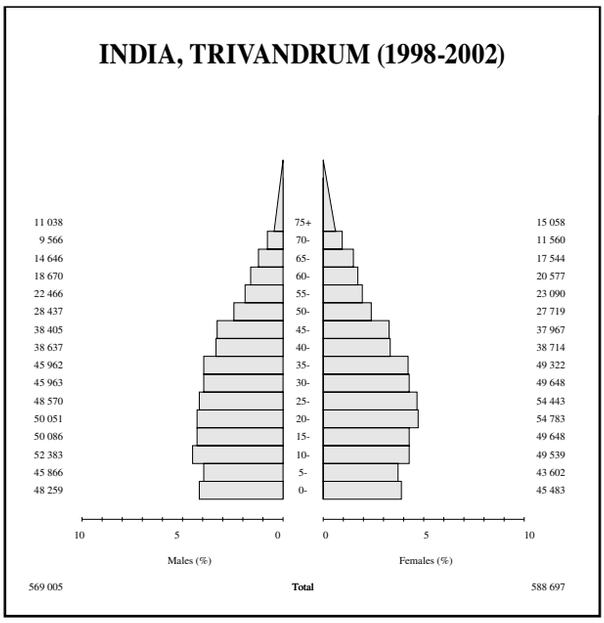
India, Trivandrum

Registration area

Trivandrum registry is situated in Kerala, the most South Western state of India. The health status of Kerala is very advanced, higher than the national average, and is comparable with developed countries. The registry covers both urban and rural population. The estimated urban and rural populations are 568 421 and 589 280 respectively as on 1st July 2000 using data from the census of India. The major religion in this part of the population is Hindus (68%), followed by Christians (18%) and Muslims (13%).

Registry structure and methods

The physical location of the registry is at the Regional Cancer Centre (RCC), Trivandrum. The registry is partially supported by the Finnish Cancer Society, Finland. Four field staff and a data manager work in the registry. The active registration method is used for casefinding by periodic visits to major hospitals, pathology laboratories, and vital statistic offices in the registry area.



The major sources of data for the registry are the Hospital Based Cancer Registry of the RCC, Trivandrum Medical College hospitals (two), and Sree Chitra Thirunal hospital, Trivandrum. All four of these hospitals are located in the same campus. Regional Cancer Centre has excellent diagnostic and treatment facilities. Patients come from all parts of the state of Kerala and from adjoining states. Annually around 10 000 cancer patients are reported in this hospital. In the medical college hospitals, around 2000 cancer patients are reported annually. Other data sources include a few government and private hospitals, pathology laboratories and radiological diagnostic centres.

Information on cancer death is collected from the vital statistics offices. For personal identification, name, age and address of the deceased are obtained from the above offices. Death certification is mandatory, but cause of death certification by a medical practitioner is not. Hence it is assumed that cancer deaths are underestimated.

Quality control (QC) procedures: Annually a 10% random sample is selected from all cases, and re-abstraction is made by a senior staff member with the help of medical officers at RCC. Re-abstraction is done using the same procedure adopted for data abstraction, without reference to the original data. QC data is then checked with the original data; the error percentage is less than 5%.

Interpreting the results

The population at risk was obtained from the decennial census figures. The census data for the year 1991 and 2001 are available by sex and five-year age groups. The populations for urban and rural areas are estimated by using an exponential growth rate method based on 1991 and 2001 census figures (Census of India report 1991 & 2001, Final Population Total, Kerala, India).

Further, an organised oral cancer-screening programme is conducted during the reporting period in some rural populations in the registry area. PSA testing is not common in the population.

As the registry data (more than 80%) are obtained from the hospital-based registry of the RCC, information such as extent of disease, treatment and disease status are available for most patients. Thus the registry data are largely utilised for cancer control evaluation programmes in the state of Kerala. The data have also been widely used for a variety of analyses resulting in several scientific publications.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Notes on the data

The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

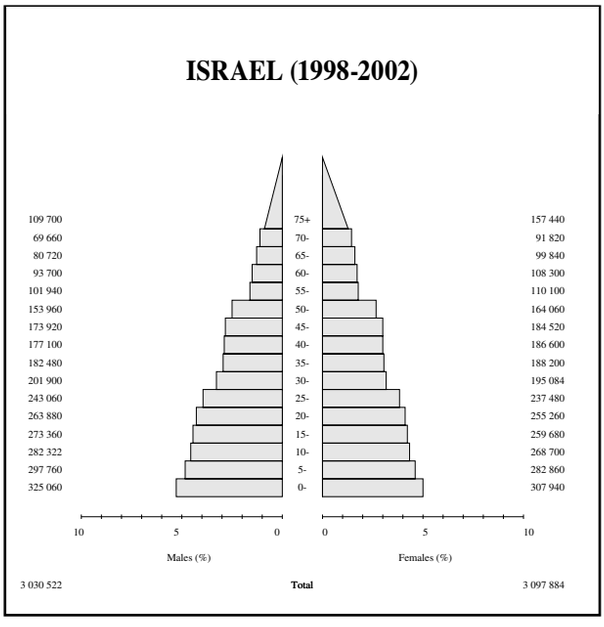
Israel

Registration area

Israel is home to a widely diverse population. Of its 7 million people, 76.2% are Jews, 19.5% are Arabs (mostly Muslim) and the remaining 4.3% comprise Druze, Circassians and others not classified by religion. In the Jewish population there are marked differences in incidence based on birthplace: (Europe and America, Asia, Africa, of Israel). The Israeli population is growing rapidly, both by internal and external means. In the late 80s approximately one million (a fifth of the existing population at that time) immigrated to Israel, mostly from the former Soviet Union. The Israeli population is relatively young; 9.9% are 65 years old and above.

Cancer care facilities

There are 33 public general hospitals and numerous private facilities that diagnose and treat cancer patients, including 18 public oncology institutes and several private facilities. There are 7 radiotherapy institutes with more than 18 linear accelerators and other facilities for treating cancer patients. Radiotherapy institutes distributed throughout the country are accessible to all patients. There are however only 14 active radiotherapists (physicians).



Registry structure and methods

The Israel National Cancer Registry, established in 1960, is part of the Center for Disease Control at the Ministry of Health of Israel. Reporting has been mandatory since 1982, and all Israeli hospitals (and since the late 1980s, also the private pathology laboratories) report, usually by submitting a copy of the medical documentation. Thus data collection is mostly passive, but when needed, registry staff visit reporting sources to collect data actively.

Reporting sources include pathology, cytology, and haematology laboratories; hospital discharge forms; oncology institutes; death notification from district health offices; and the file of deaths from the Central Bureau of Statistics. Since 2000, through collaboration with the Israeli Hematology Society, all haematologists have been reporting the haematological malignancies that they see.

Beginning in the 1970s, several studies have assessed the registry's completeness, with the latest one based on 1994 data. These studies actively searched for cancer patients in a defined period in major hospitals, and compared the resulting data with the registry file. These studies resulted in estimated completeness rates of >94% (usually >95%) for solid tumours.

All Israeli citizens are given unique identification number (at birth or immigration). This number, used in all contacts with the health system and government departments, prevents duplication of data. The registry annually receives a file containing all deaths in the country, which it uses to update vital statuses.

Accuracy and completeness of registration at the Israel National Cancer Registry (INCR) is checked regularly, and a systematic review is done every few years. Ongoing monitoring includes monitoring all reporting sources (more than 90) for volume of reporting, continuous colloquium and monitoring changes and by record linkage with specific cancer databases. A 2003 report based on registration in the early 1990s, estimated completeness of solid tumours to be >95% (90% for non-solid tumours). As a result the INCR, together with the Israeli Center for Disease Control and the 4 HMOs operating in Israel, developed a continuous medical education and training program. In addition, the Israeli Cancer Organization finances 10 clerical positions at various oncology departments for secretaries devoted to registration and notification to the INCR. More than 150 clerks, nurses and physicians have attended these courses to date, and several hundred attended the seminars.

In 2001, the entire database was converted to ICD-O-3. Prior to this change, sites were coded by the ICD-9 and morphology by ICD-O-2. All copies of medical documents are archived (electronically since 1997), and in cases where simple code conversion was not possible, we revised the original documentation and assigned the new code. The database still contains backups of the former coding.

Interpreting of the results

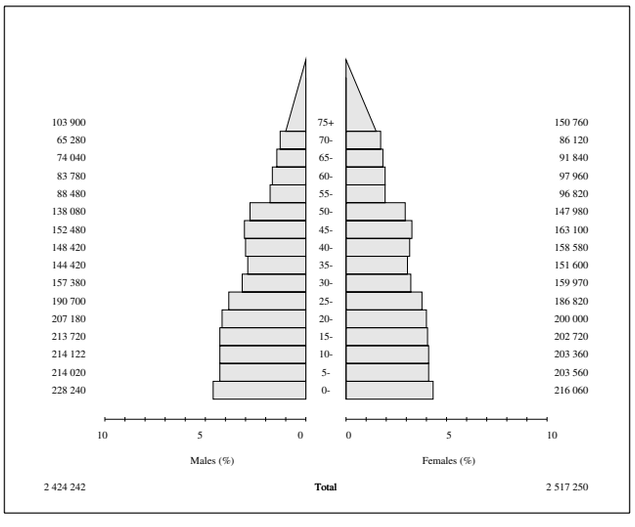
The Ministry of Health together with the Israeli Cancer Association and the 4 HMOs operates screening programs for breast and colorectal cancers. Active mammography screening began in late 1996, and all women aged 50–74 receive biennially a personal invitation for screening. Screening for colorectal cancer, which began in 2005, is made by Faecal Occult Blood Tests. The recruitment technique is the same as for mammography and involves active recruiting. Compliance for the mammography screening is about 60%. There is no organised cervical cancer screening due to its low incidence. The INCR collects data on CIN-III that can also serve as an estimation of ad-hoc screening. There is no official recommendation or screening programme for prostate cancer and PSA testing. Survey data show that awareness of PSA screening is relatively high and use of this test is widespread.

There is an elevated risk of radiation-induced malignant brain tumours and benign meningiomas after childhood exposure to ionizing radiation used in the 1950s to treat tinea capitis, almost exclusively affecting the sub-group originating from North African countries. Thyroidal cancer

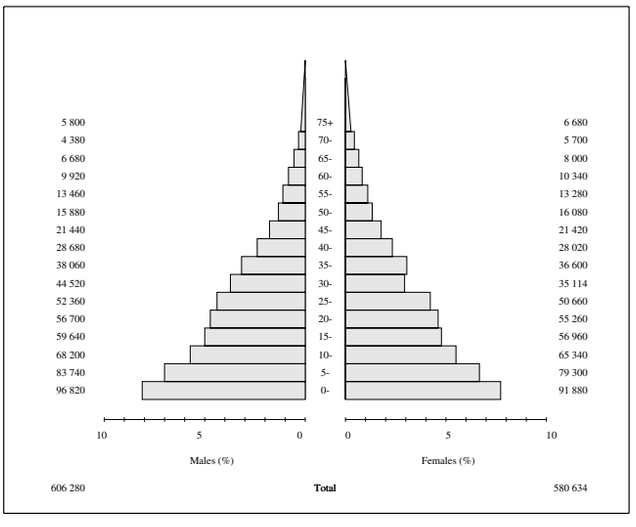
morbidity may be increased in that population as well as in those emigrating from regions in the former Soviet Union affected by the 1986 Chernobyl accident.

Use of the data
The registry is involved in active cancer research and health planning. Numerous record linkage studies have been performed locally and internationally. The registry participates in the national council for oncology, the country's policymaking body in the field, collaborates with HMO's helping them build capacity and monitoring abilities, participates in new technologies for screening and treatment implementation, as well as conducting cluster investigations and disseminating information.

ISRAEL: JEWS (1998-2002)



ISRAEL: NON-JEWS (1998-2002)



Source of population
Annual population estimates are published by the Central Bureau of Statistics.

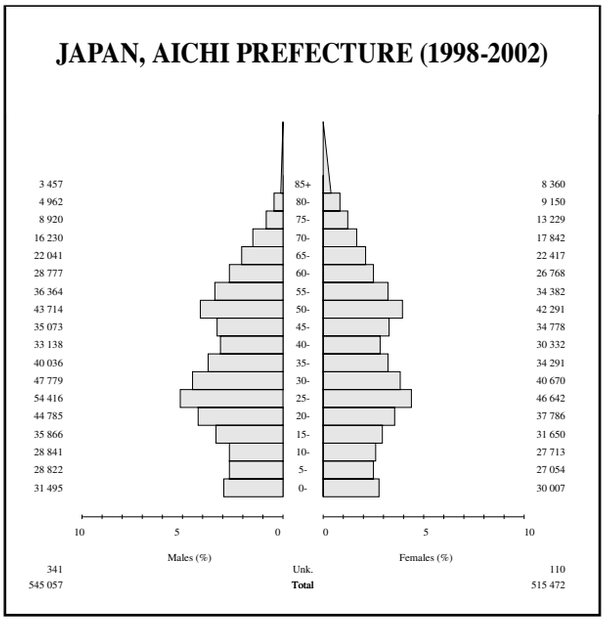
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Japan, Aichi Prefecture

Registration area
Aichi Prefecture is located in the approximate centre of Japan, between latitudes 34.5°and 35.2°N and longitudes 136.5°and 137.5°E, and is flanked on the south by the Pacific Ocean. The prefecture spans an area of 5,146 km^2 and has a population of 7.4 million. The altitude ranges from sea level to 1415m. Nagoya, the capital city of Aichi Prefecture, is situated about 350 km west of Tokyo. The annual mean temperature in Nagoya is 15.6 (5.9–19.9 degrees) and annual rainfall is about 1500mm.

The quality of the Aichi Cancer Registry remains modest, mainly due to dependence on voluntary-based operations without legal obligations. During the last 20 years we established a model area, located in the central part of Aichi Prefecture, with good-quality registry data, covering a reasonable population, including both urban and rural areas. The Central Area of Aichi Prefecture consists of 8 cities and one town. The total registration area is 646 km^2, and the population as of 2000 was 1 060 529. Only 2.1% of the economy is engaged in primary industry; 46.7% is in secondary industry and the remaining 50.5% in tertiary industry.

All of the registered subjects are Japanese. Buddism is traditionally the dominant religion (more than 90%); however, precise data on religion are not available.



Cancer care facilities
As in large cities in Japan, every kind of diagnostic/treatment service for cancer is easily available. The costs required are covered by public health insurance in general; there is no limitation for access to each service. Radiotherapy departments are available in large institutions in the area.

Registry structure and methods
Aichi Cancer Registry was established in 1962 as a population-based cancer registry, the purpose of which was to form an accurate picture of cancer in Aichi Prefecture, in order to control its impact. Initially under the direction of the Aichi Prefecture Department of Health and Public Welfare, all medical institutions in Aichi Prefecture are requested to report incident cancer cases on the basis of the cancer registry outline. The registry has received technical support from the Division of Epidemiology and Prevention, Aichi Cancer Center Research Institute, since 1983, and has been subject to periodic evaluation by the Administration and Guidance Council since 1984.

The registry staff consists of 2 doctors and 3 registrars, and a local government officer for Registry who is also a doctor.

A dramatic overhaul of the registration system has been undertaken with a view to rationalising Aichi Cancer Registry and strengthening its effectiveness. This has been supported by a grant from the Ministry of Health, Labour and Welfare (awarded 1998). The aims of the Revised Cancer Registry System are: 1) to establish a more comprehensive organization, with Aichi Cancer Center as a core institution for cancer research and treatment, and the prefectural public health centres as core facilities for community health services; 2) to promote the installation of a hospital cancer registration system in every relevant medical institution; 3) to provide cancer information and expedite cancer control measures in the community. The new system has been in operation since 1999.

The research group supported by a Grant-in-Aid from the Ministry of Health, Labour and Welfare from 2004 monitors the quality in the registry every year. In 2006, a national standardised database system for regional cancer registry developed by the research group was introduced.

Interpreting the results
As in other areas in Japan, local governments support stomach, colon, breast, lung and cervix screening. In practice, PSA is commonly available; however, PSA is not defined as official tool for prostate cancer screening.

Use of the data
In addition to providing descriptive data on cancer incidence, the data have been used for various epidemiological investigations including cohort studies, case-control studies and evaluation of screening programmes for important cancer sites.

Source of population
Census data in 2000. The data for 1998 and 1999 were estimated by linear interpolation from 1995–2000 census data, and those for 2001 and 2002 were by linear extrapolation.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Japan, Fukui Prefecture

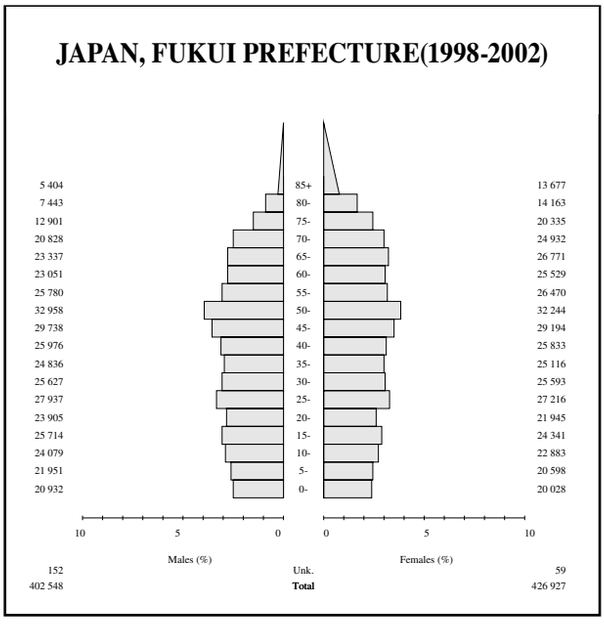
Registration area
Fukui Prefecture is located in the centre of Japan, and has a population of about 820 000 people and an area of 4189 km^2. About 90% of the population lives in urban areas (>10 000 inhabitants); 99% are Buddhist.

Cancer care facilities
The six main district hospitals provide radiotherapy, cancer surgery and chemotherapy services. Patients suspected to have cancer in the primary and secondary care facilities in the registry area are mostly referred to these six hospitals.

Registry structure and methods
In 1984, the Fukui Prefectural Government (FPG) decided to start cancer registration on a voluntary basis in order to obtain information about the nature and extent of the cancer problem in Fukui and assist in planning cancer control programs, and entrusted the survey to the Fukui Medical Association (FMA). The registry is located within FPG and is staffed by a part-time registrar and a full-time health worker.

The central registry receives monthly a batch of cancer reports transferred from the FMA and death certificates from the Department. Each data card is checked for consistency, coded and stored on computer files. Questionnaires are sent to physicians who signed death certificates that are unmatched with cancer reports. The data in the questionnaire replies are also stored in the computer file after being checked for logicality. The original cancer reports and the copies of death certificates mentioning cancer are also stored, living cases being filed by date of birth, dead cases grouped by year of death and filed by date of birth. Multiple primary cancers in the same patient are counted separately.

The research group, supported by a Grant-in-Aid from the Ministry of Health, Labour and Welfare from 2004, monitors quality in the registry.



Interpreting the results
Organised screening services for stomach, colorectal and cervix are operated. PSA testing is not common.

Use of the data
The data are used for geographical analysis in the prefecture and comparison of cancer morbidity with existing cancer registries in Japan. The registry prepares an annual report of cancer incidence, highlighting trends and changes. Some special studies of survival of registered cancer cases (stomach, colorectal and cervix cancer) have been carried out. Policymakers use the cancer registry data for evaluation of screening for gastric cancer and colorectal cancer.

Source of population

Impossible to detect multiple primaries.

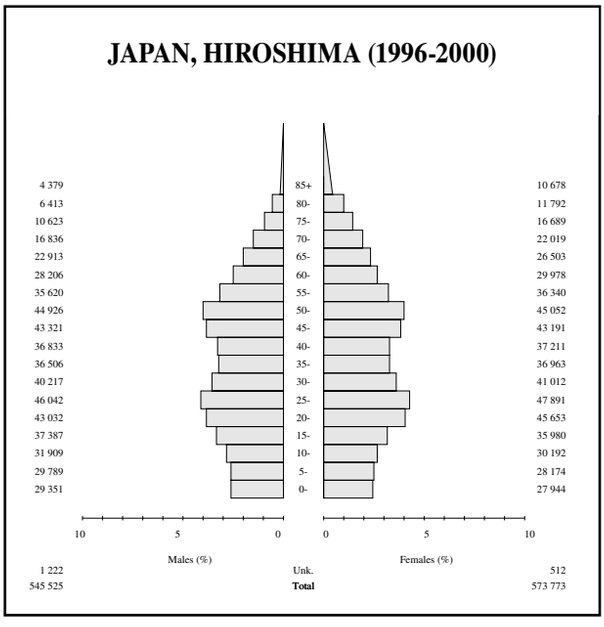
Japan, Hiroshima

Registration area

Hiroshima City, the capital of Hiroshima Prefecture, is located in the western part of Japan facing an inland sea. It covers an area of 742 km^2, from 132°18' to 132°41'E and from 34°17' to 34°36' N, and the altitude ranges from sea level to 890m. The annual mean temperature of the city is 16.1° and the annual rainfall is about 1320mm. Hiroshima City is an administratively defined area that does not completely correspond to the Hiroshima metropolitan area. The latter includes the city itself and its surrounding areas.

As is widely known, Hiroshima City was destroyed by an atomic bombing in 1945. After the war, it developed into the administrative centre of the Chugoku and Shikoku regions. The major industries include shipbuilding, automobile, metalworking, machinery and other manufacturing/ production.

The population in 2000 was 1.13 million, comprising mostly Japanese (99%) and very few non-Japanese nationals (1%). The population density was 1518/km^2 in 2000, slightly higher than the 1467 calculated in 1990. The proportion of residents 65 years and over was 14.2% in 2000, compared with 9.8% in 1990. The population is primarily urban; 73% of employees are in the sales trade and service industries, 24% in construction and manufacturing industries and only 1% are engaged in agriculture and related work.



Cancer care facilities

The number of hospital beds per 100 000 population was 1351 in 2000, and the number of physicians per 100 000 population was 246. Diagnostic and treatment services for cancer are abundant in the area, and cancer patients are treated with radiotherapy in most of the major hospitals. Cancer screenings for stomach, colon, lung, female breast, and cervix uteri are provided in local governments and workplaces as well as private sectors. PSA testing is also widely available.

Cancer registry and structure

The Hiroshima City Medical Association's Tumor Statistics registry was established in 1957 with technical support from the Atomic Bomb Casualty Commission (ABCC), predecessor of the Radiation Effects Research Foundation (RERF). As of April 2005, the registry has been placed under the auspices of the Hiroshima City government and renamed the Hiroshima City Cancer Registry.

The case-finding and data-collection procedures combine both active and passive approaches. All physicians and hospitals in the city are requested to report tumour cases to the registry. However, the great majority (about 90%) of cases are accessed by means of hospital visits. RERF field personnel visit the medical record rooms of various departments and services of most large hospitals in the area, and review all hospital records, including clinical records, surgical reports, radiology reports, and cytology, pathology and autopsy reports. Causes of death are also ascertained at that time.

The Hiroshima Prefecture Tissue Registry was started in 1973 under the auspices of the Hiroshima Prefectural Medical Association and has been integrated with the Hiroshima Prefecture Cancer Registry since April 2005, serving as an additional source of information. The Tissue Registry is designed to collect and examine surgically removed tumour tissues; tumours are then classified and tissue slides of malignant tumours are stored. Malignant cases residing in the city and identified through the Tissue Registry are added to the Cancer Registry file.

Cases identified from various hospitals and sources are collated, and data are stored in computerised files. Checking for duplicate entries is performed manually with the assistance of a computer. All cases with possible multiple primary tumours are reviewed; pathology slides from the Tissue Registry are also reviewed, if necessary.

RERF are involved in all of the registries mentioned above, and 16 staff including one medical doctor are employed in the Tumor and Tissue Registry Office.

Interpreting the results

Since a majority of cases are ascertained by visits to large hospitals, cases missed by not including all area hospitals present a source of concern. However, a previous survey of three medium-sized hospitals not included in the regular data abstraction schedule showed the number of missed cases from medium-sized hospitals to represent less than 1% of the total cancers.

Use of the data

The objectives are to maintain a source of information on tumours diagnosed in the community and to provide cancer incidence data for studies on the effects of exposure to radiation from the atomic bombing in 1945. This has resulted in a number of large-scale cancer studies in the area.

The incidence data are used for health promotion planning for Hiroshima City.

Source of population

1996–1999 Estimates based on the 1995 and 2000 census data; 2000 census.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Japan, Miyagi Prefecture

Registration area

Miyagi prefecture is situated in the northern part of Japan, between latitudes 37° and 39°N and longitudes 140° and 141°E, and is flanked on the east by the Pacific Ocean. Sendai, the capital city of the prefecture, is situated about 350 km north of Tokyo. The annual mean temperature in Sendai is 12.3°C, and the annual rainfall is about 1200mm. The altitude ranges from sea level to 1841m. The total registration area is 7291 km^2, and the population as of 2000 was 2 365 320, including 10401 foreigners (4515 male and 5886 female). Of the economically active population, 26% is engaged in personal services, 25% in commerce, 15% in industry and 5% in agriculture.

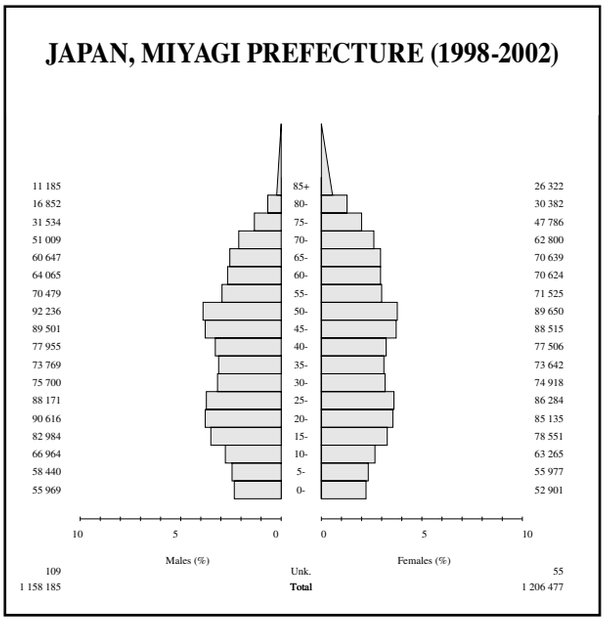
Registry structure and methods

The Miyagi Prefectural Cancer Registry (formerly Miyagi Cancer Registry, initiated in 1951 by the late Professor Mitsuo Segi at the Department of Public Health, Tohoku University School of Medicine) marked its 47th year since registration was restarted in 1959. The registry has covered the entire prefecture from the beginning. The office has been located in the Miyagi Cancer Society since 1976. Miyagi Prefecture provides grants for cancer registration, and the Miyagi Cancer Society also supports it financially. All the work of the registry is the responsibility of the Registry Committee, comprising representatives of the Miyagi Medical Association, Tohoku University Graduate School of Medicine, Miyagi Prefecture, and the Miyagi Cancer Society. The registry is staffed by a part-time medical doctor, three full-time registrars and three personnel.

In Sendai, cancer diagnostic and treatment services are mainly provided at Tohoku University Hospital and several general hospitals. Provincial areas outside Sendai are divided into nine secondary medical care areas; a few general hospitals provide cancer diagnosis and treatment in each area. Radiation therapy is available at the university hospital, one cancer centre (Miyagi Cancer Center), and several general hospitals.

Cancer cases are registered from clinics and hospitals (inpatients and outpatients), radiology and pathology departments, autopsy records, mass screening records and death certificates. Reporting by clinics and hospitals is voluntary. About 30% of cases are reported from hospitals and clinics, and 70% abstracted by the registrars at the cancer registry. Multiple primary cancers are counted separately in computing incidence.

All the death certificates of Miyagi Prefecture are collated with the registered cases. Follow-up is passive, with only perusal of all death certificates. Active follow-up of the cases is not currently conducted. Quality of the information recorded is evaluated by the research group supported by a Grant-in-Aid from the Ministry of Health, Labor and Welfare.



Use of the data

In addition to providing descriptive data on cancer incidence, the data have been used for various epidemiological investigations including evaluation of screening programs for cancers of the stomach, colon, prostate, cervix and breast, and population-based prospective cohort studies of cancer and lifestyle factors (such as smoking, drinking, and diet).

Multiple primary rules used

IACR rules (2004) on historical data.

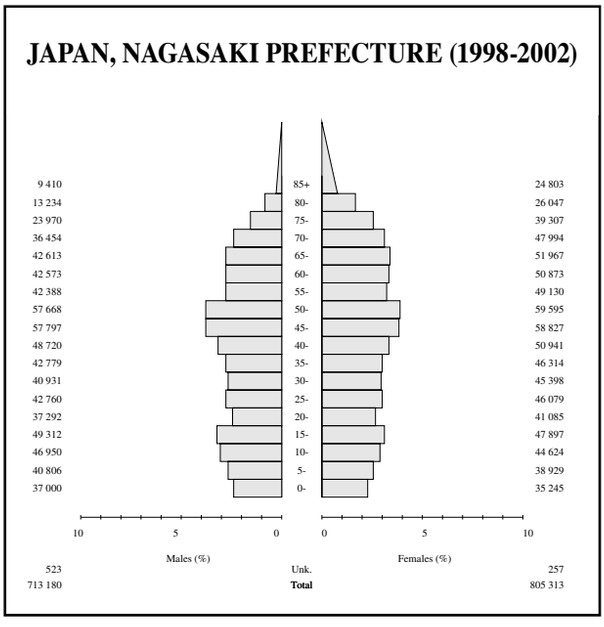
Japan, Nagasaki Prefecture

Registration area

The Nagasaki Prefectural Cancer Registry is a community-based cancer registry covering the entire prefecture. Nagasaki prefecture is located on the western end of the Japanese archipelago, comprising 4092 km^2 and 1.52 million people (based on a 2000 National Census). The proportion of non-Japanese citizens is only 0.3% of the total population.

One third of the prefecture's population resides in Nagasaki City, where shipbuilding is one of the primary industries. For the overall prefecture, the combined proportion of service and retail/restaurant industries is over 60% of the total, while the manufacturing industry including shipbuilding comprises 12%. The combined proportion of agriculture, forestry and fishery makes up only 1% of all industries.

Nagasaki Prefecture also contains 55 inhabited islands whose residents comprise 10% of the prefecture's population. This is a primary reason for the difficulty of providing medical care uniformly within the prefecture.



Cancer care facilities

Nagasaki Prefecture does not have a cancer centre but does have 13 hospitals where more than 100 cancer cases are treated annually. These hospitals are concentrated in Nagasaki city and in the city of Sasebo, and 70% of cancer patients in the prefecture are treated at hospitals in these cities.

Nagasaki Prefecture also has cancer screening facilities, where examinations are conducted for cancers of the stomach, colon, lung, breast and uterus.

Registry structure and methods

The Department of Epidemiology of the Radiation Effects Research Foundation houses the central registry office of the Nagasaki Prefectural Cancer Registry, which consists of one physician, nine full-time employees, and a few part-time employees.

The Nagasaki Prefectural Cancer Registry collects cancer incidence data mainly by abstraction from clinical records, and three of the full-time staff members are exclusively engaged in visiting hospitals for such abstraction work. Every year these staff members visit 20–30 hospitals (most are hospitals with 200 beds or more) within the prefecture to collect the necessary information. We also make an effort to collect data on pathological diagnoses with support from pathologists. Cases with histological diagnoses comprise more than 80% of the registered cases. Data on cancer cases detected in such screening programs have also been obtained.

The Nagasaki Prefecture government provides data on all deaths within the prefecture, enabling verification of the deaths in the registered cases through matching both data sets. With respect to cases recorded as cancer, if there are no matched cases among the registered cases, the cases are registered as DCO (death certificate only).

Medical organisations in Japan are not legally required to file notices of cancer cases. As a result, obtaining notification of cancer cases remains difficult, particularly in Nagasaki, since data collection has traditionally depended on medical record abstraction. A Personal Information Protection Law became effective in April 2005. However, the Ministry of Health, Labour and Welfare informed medical organisations that providing cancer registries with incident data would be exempt from application of this law, thus avoiding any decrease in registration rate caused by the law's effects.

For the purpose of preventing errors in coding and entry, varied logical checking functions are utilised at the time of data entry. Also, comparison among the registry cases is conducted once a year to prevent overlapping, with error in such comparison work detected at a rate of about 0.2%.

Interpreting the results

In 1958 a cancer registry covering Nagasaki city was started, and in 1985 the Nagasaki Prefectural Cancer Registry was initiated, thus covering the entire prefecture. Concerning the effect of the changes of coding rules on incidence, it is conceivable that the incidence of MDS and uterine cervical severe dysplasia have contributed to an increase in incidence because these two diagnoses are coded as malignancy using ICD-O-3.

Although screening has been conducted for stomach cancer (12.4% participation), colon cancer (16.5%), lung cancer (27.5%), breast cancer (16.9%) and uterus cancer (18.7%), such screening is not obligatory and the participation rates are not very high. Recent changes of note are increased use of mammography in breast cancer screening and change in the eligible age for undergoing uterus cancer screening from 30 years and over to 20 and over. Although PSA testing is commonly utilised, it is still being debated whether the test should be used in cancer screening, and as a result testing remains unorganised.

Many A-bomb survivors still reside in Nagasaki, on which an atomic bomb was dropped in 1945. The effects of A-bomb radiation on cancer incidence remain, but there have been no other reports on environmental or occupational exposure that could affect cancer incidence.

Use of the data

Every year we compile and announce the incidence, mortality, and survival on cancer in Nagasaki prefecture, and we also participate in a project to estimate nationwide cancer incidence in Japan, providing the project with our data. Our data are often used for research purposes, thus greatly contributing

to the elucidation of association between radiation exposure and cancer incidence. Additionally, the data are frequently utilised in descriptive epidemiology involving ATL/ATLL, which are unique to Nagasaki Prefecture. For government-related purposes, our data is also utilised in the design of medical projects and assessments of cancer screening.

Source of population

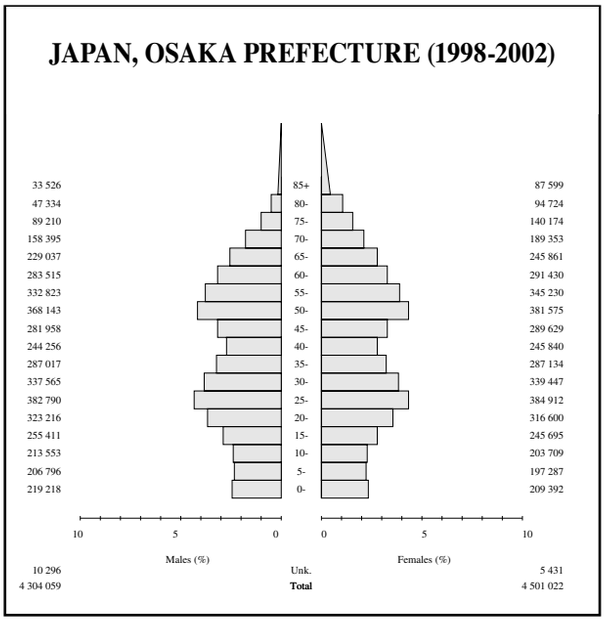
Multiple primary rules used
IACR rules (2004) on historical data.

Japan, Osaka Prefecture

Registration area
Osaka Prefecture is located in the central part of the main island of Japan. The surface area is the second-smallest (1893 km^2), but its population density is the second highest (4652/ km^2) among all 47 prefectures in Japan. Osaka City is the capital of the Prefecture. The population of Osaka Prefecture was 8.8 million in the 2000 census; 98% were Japanese, 1.5% Koreans, and 0.2% Chinese. Of all workers, 30% are engaged in industry, 68% in commerce, and 0.5% in agriculture.

Registry structure and methods
The Osaka Cancer Registry (OCR), covering Osaka Prefecture, has been operating in cooperation with the Osaka Prefectural Department of Health and Welfare (OPDHW), the Osaka Medical Association (OMA) and the Osaka Medical Center for Cancer and Cardiovascular Diseases (OMCCD) since 1962. The central registry, located in the Department of Cancer Control and Statistics of the OMCCD, is staffed by 9 regular employees (2 medical doctors, 2 public health nurses, 2 system engineers, 1 operator and 2 clerks) and 7 part-time workers.

The OMA requests that all medical institutions in the Prefecture cooperate with cancer registration, and prepare cancer reports when cancer diagnoses are made. The cancer reports are sent to the OMA, and they are transferred monthly from the OMA to the central registry. Information on death certificates mentioning cancer is also obtained through the OPDHW.



The data are processed in an annual batch via mainframe, although the data processing has changed to an online network with client-server system. Computerised record linkage is used to avoid duplicate registration, distinguish multiple primaries, and identify registered cases who died of cancer and cancer deaths that had not been registered. Computer-produced possible matches are shown and resolved manually through referring to the original reports.

In order to evaluate survival of cancer patients, active follow-up to ascertain vital status has been undertaken progressively. High-quality survival data have been available for patients diagnosed from 1975 except for Osaka City, and all patients diagnosed after 1993 in Osaka Prefecture. Proportion of the lost-follow-ups has been 1-2% at five years after diagnosis.

The OCR has implemented cancer information service programs since 1975. The prognoses of reported patients, as well as cancer statistics of each hospital, are provided at the request of participating hospitals or hospital doctors. The central registry holds an annual conference to report and discuss cancer registration activities, inviting representatives from all large and medium-sized general hospitals and clinical departments of medical university hospitals. Since 1999 software has been developed and distributed to support hospital-based cancer registries, and assist in notification of cases to the OCR.

In order to assess accuracy and completeness we have incorporated a data check program compatible with the IARC-CHECK, and routinely used several validity indexes such as DCN/I, DCO/I, I/D and HV/I.

The Osaka Prefecture Privacy Protection Law has been effective since October 1996, while the Prefecture Privacy Protection Council has approved the schemes of OCR as legitimate under the Law. On April 2005 a Privacy Protection Law came into effect in Japan, but informed consent is waived when personal information is needed to improve public health, including submission of cancer data from medical institutions for population-based cancer registries.

Interpreting the results
According to recommendation of the Japanese Ministry of Health, Labor and Welfare, women over age 30 have been screened for cervical cancer since 1982 (proportion of cases receiving screening was 16.5 % in 2001, in Osaka), and for breast cancer since 1987 (11.2%). The population over age 40 has been screened for stomach cancer since 1982 (15.7% in male and 11.8% in female), lung cancer since 1987 (9.2% in male and 6.5% in female) and large bowel cancer since 1992 (11.2% in male and 9.0% in female). The screenings are all opportunistic and the proportions screened remain low in Osaka. PSA testing is not common yet in the population.

Use of the data
The major objectives of the OCR are (1) to estimate incidence rates, (2) to compute statistics on medical treatment given to cancer patients and (3) to estimate survival for cancer patients. Annual reports including these statistics have been published. Summary statistics of these can be seen on the OMCCD website (http://www.mc.pref.osaka.jp/ocr_e/index.html). The OCR takes the initiative to conduct epidemiological research, and policymakers use our cancer registry data for planning and evaluation of health services.

Source of population
2000 census. The data for 1998 and 1999 were estimated by linear interpolation from the 1995 and 2000 census data, and those for 2001 and 2002 were by linear extrapolation. Refs: 2000. Statistics Bureau, Management and Coordination Agency, Government of Japan, 2000 Population Census of Japan, Vol. 2–2–27 0saka–Prefecture. Tokyo, 2001. 1995. Statistics Bureau, Management and Coordination Agency, Government of Japan, 1995 Population Census of Japan, Vol. 2–2–27 Osaka–Prefecture. Tokyo, 1996.

Multiple primary rules used
IACR rules (1990).

Japan, Yamagata Prefecture

Registration area
The Yamagata prefectural cancer registry covers the entire Prefecture of Yamagata, which is located in northeastern Japan. It lies between latitudes 37° and 39°N and longitudes 139° and 140°E. The total registered area is 9323 km^2, and over two thirds of the area consists of forests and mountains.

The 2000 census determined the total population of the Yamagata prefecture was 1 244 147 and composed of 99.6% Japanese nationals. Of working adults, 54% are engaged in the sales and service industry, 35% work in construction and manufacturing, and 11% work in agriculture. The population of people who are 65 years and over was 23% in 2000 and 16% in 1990.

Cancer care facilities
In 2000, Yamagata had 2307 physicians (1.9 per 1000 inhabitants) and 11 336 hospital beds (excluding psychiatric hospitals). The prefecture is divided into 4 healthcare districts. Each district has several core general hospitals, where two thirds of the cancer patients in Yamagata prefecture are diagnosed and treated. Eight of the hospitals have a radiotherapy unit.

Registry structure and methods
The Yamagata prefectural cancer registry was established in 1974. The prefectural government finances the registry. A full-time medical doctor as the medical supervisor and researcher staffs the registry, and also a full-time and a part-time registered staff member since 2004. Before 2004, it was staffed by a part-time medical doctor and a part-time registered staff member.

Although cancer is not a notifiable disease, the main method of data collection is passive notification. To increase the number of notifications, the registry staff supplements their casefinding with pathology reports from several major general hospitals and request physicians to be notified about these cases. The registry staff has access to all death certificates with their personal information. A research group supported by the Grant-in-Aid from the Ministry of Health, Labour and Welfare since 2004 monitors quality standards in the registry every year.

In 2005, we performed data cleaning for all registered data in 2005, including converting site and histological codes from ICD-10 and ICD-O-3 to ICD-O-3.

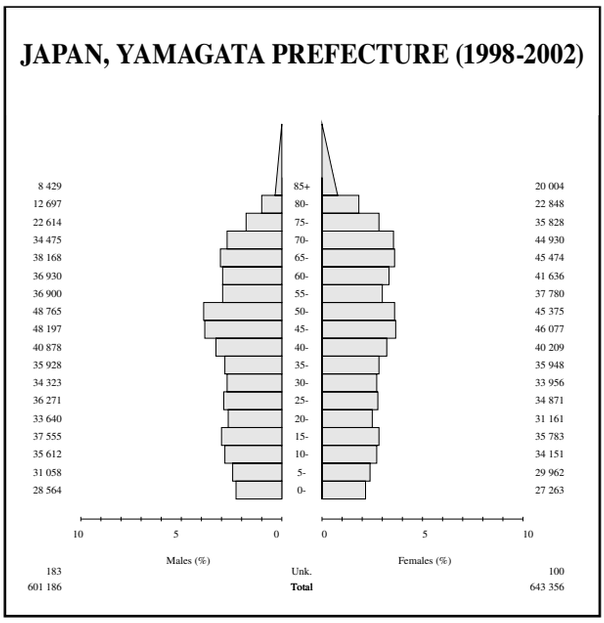
Interpreting the results
The establishment of three major general hospitals in 1976, 1993 and 2000 likely altered the availability of diagnostic and/or treatment services. Since our establishment in 1974, there has been no serious environmental or occupational exposure that may influence cancer incidence in the population.

Organised screening programs are conducted in Japan (for gastric and cervical cancer since 1961 and for colon, lung and breast cancer since 1987). Screening for breast cancer by mammography was introduced in 2002. The prostate cancer cases diagnosed by opportunistic PSA testing have been increasing in several hospitals recently.

Use of the data
The registry provides periodic reports on cancer incidence and five-year survival statistics. The regional health authority for planning and evaluating health services uses the data. The data are also used to estimate cancer incidence in Japan.

Source of population
1998, 1999, 2001, 2002 estimates based on the 1995 and 2000 census data; 2000 census. (Vital statistics of Japan).

Multiple primary rules used
Impossible to detect multiple primary.



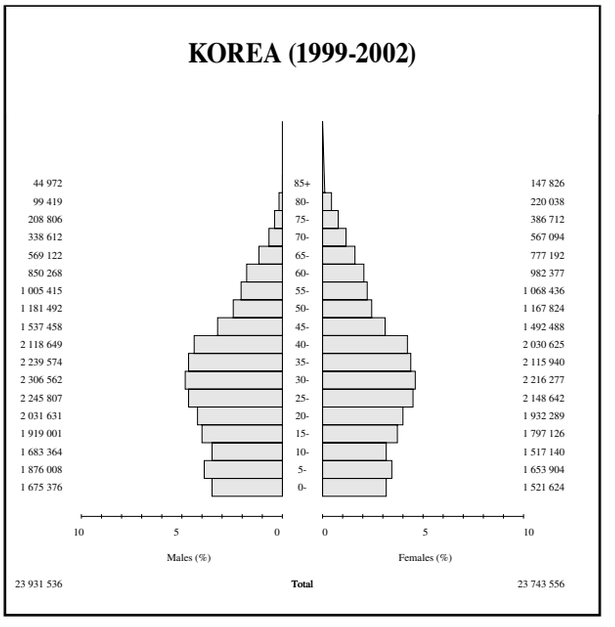
Korea

Registration area

The Republic of Korea (South Korea) occupies the southern portion of the Korean Peninsula. It lies between longitudes 124° and 131°E and latitudes 33° and 38°N, and has an area of 99 500 km^2 including about 3000 islands. South Korea is highly mountainous, and lowlands constitute only 30% of the total area. There are seven cities with provincial status and nine provinces.

The population of the Republic of Korea is 48 million (2005 estimates), which the Central Cancer Registry is supposed to cover. Its population density of 493/km^2 is one of the highest in the world. Annual population growth has dropped steadily from more than 3% in the late 1950s to 0.38% in 2005. Due to rapid urbanisation, 80% of the population is now classified as urban. The population is ageing very quickly: The 2003 population estimate revealed that 8.3% were 65 years old or over; 71% were aged 15–64 years. South Korea is one of the most ethnically homogeneous countries in the world. Most people are ethnically Korean. Buddhism and Christianity are the largest religions in South Korea, but Confucianism, rather a philosophy than a religion, is in many ways more prominent in Korean culture than any organised religion.

In 2004, the economically active population was 23.3 million. Of this figure, 8% were engaged in agriculture, forestry and fishing; 27% in industry; and 65% in services.



Cancer care facilities

In 2005, there were approximately 1500 hospitals in Korea, 1000 of them, including 29 multidisciplinary cancer treatment units, providing specialised cancer diagnostic and therapeutic services. There were 60 radiology units and 123 specialists nationwide in 2006. In addition, 2500 out of 26 000 private clinics provide general cancer care services.

Registry structure and methods

The Korea Central Cancer Registry (KCCR) was one of the ambitious projects of the Ministry of Health and Welfare in 1980. Beginning in 1982, 47 general hospitals voluntarily participated in this program. Participating hospitals and registered malignancies increase annually, and 154 of 242 teaching hospitals participated in 2005. The KCCR is composed of a chief, an executive secretary (head of cancer registration), a medical officer, 6 cancer registrars, 6 statisticians, and 11 advisors. In a 2004 workshop for the new cancer registry manual, approximately 300 cancer registrars attended from the hospitals.

The KCCR is responsible for (1) collection, analysis and management of national cancer statistics, (2) technical and financial support of regional cancer registries including cancer registrar training, (3) analyses and summary of data from the central and regional cancer registries, (4) carrying out administrative tasks related to the registry.

The KCCR established the Korea National Cancer Incidence Data Bases (KNCIDB) by merging the KCCR mother DB and all 8 population-based Regional Cancer Registry databases, the site-specific cancer registry databases (breast, uterus, ovary, oral cavity, liver cancer), the medical record review survey and the cancer mortality database from National Statistics Office. For the medical review survey, a 1999-2003 cancer claims DB from the National Health Insurance Corporation was also used. The dataset was refined further by confirming multiple primaries and removing duplicates with expert help from various fields-clinicians, pathologists and medical recorders.

In an effort to improve the KCCR data quality, data completeness has been evaluated, with a preliminary result as high as 90.3%. We are in the process of evaluating the accuracy of stomach cancer data through abstract-reabstract method, and plan to perform the evaluation on a regular basis for additional types of cancers.

Interpreting the results

To cover cases diagnosed outside KCCR-affiliated hospitals, we perform an additional medical record review survey and supplement our data with cases from regional registries. Thus data completeness in areas with regional registries may be different from those without.

In 2000, most teaching hospitals in Korea could not provide medical service properly at least for 3 months due to a doctors' strike. Delayed diagnosis and reporting of new cases resulted, which could decrease the number of 2000 cases and increase the 2001 cases.

The National Cancer Screening Program (NCSP) was implemented in 1999 and has since expanded its target population and cancers. NCSP provides screening for stomach, liver (high-risk groups only), cervical, breast and colorectal cancer. Opportunistic screening is also common. Annual PSA testing is actively recommended by urologists for men aged over 50. Though there are no official data, most men over 50 have received a PSA test.

Even though the 2003 Cancer Act clearly stated that cancer registration should be performed to know the burden of cancer, privacy protection laws prohibit access to personal information. An amendment to the Cancer Act to allow access is underway.

Use of the data

The KCCR has released its annual reports since 1983, and published *Cancer Incidence in Korea 1999–2001* in August

2005 as the first cancer incidence report based on the entire population using KNCIDB. Annual data are published in the official journal of Korean Cancer Association (*Cancer Research and Treatment*). The KCCR provides data without personal information to researchers as well as other government departments for statistical analysis. Registry data are essential to evaluate cancer control programmes in Korea, including the National Cancer Screening Program.

Source of population
The population used to calculate cancer incidences is a mid–year population (the population at the 1st of July), but in this report, the modified resident registration population data that is released annually from the Korea NSO was used.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Korea, Busan

Registration area

In 1995, the Busan Cancer Registry (BSCR) was established in cooperation with the Cancer Centres of four University hospitals, and has administratively been supported by the Department of Public Health and Sanitation of Busan City and the Medical Association of Busan. The Korean National Cancer Control Program is responsible for the financial support of the registry, with technical support from the Korea Central Cancer Registry.

The city of Busan is located on the southeastern tip of the Korean Peninsula, between latitudes 34°52′ and 35°23′ N, and longitudes 128°52′ and 129°8′ E. The city has an area of 531.17 km^2. At the 1995 census, the total population of Busan was 3 806 888, of whom 99.6% were Korean.

Cancer care facilities

In 2005, there were approximately 110 hospitals including teaching and general hospitals (4 university hospitals and 22 general hospitals) in Busan. Because Korea is a one-day life zone for the whole country, every cancer patient can go to other regional hospital if he/she wants.

Registry structure and methods

The nation-wide, hospital-based Korea Central Cancer Registry (KCCR) was established in 1980 and has been managed by the Ministry of Health and Welfare (MOHW) since then. All inpatient cancer cases are voluntarily notified to the KCCR by the Medical Record Department of about 80% of teaching hospitals.

In 1995, a pilot study was conducted to expand the into a population-based registry of Busan. We found that 72% (67% from hospitals in Busan; 5% from other places) of the total incidental cancer cases could be registered using the KCCR data and the remaining 28% by active registration.

In Busan, there are 26 large hospitals including four university hospitals and additional 80 medium- and small-sized hospitals. Among these, 22 teaching hospitals notify all inpatient cases as well as some of outpatient cases to KCCR.

The KCCR annually gives data to the BSCR on the cancer patients living in Busan at the time of their initial cancer diagnosis. Cases from hospitals in other places are treated similarly. Additional cancer cases from outpatient clinics are identified from the records of the Departments of Anatomical Pathology, Diagnostic Radiology, and Radiation Oncology.

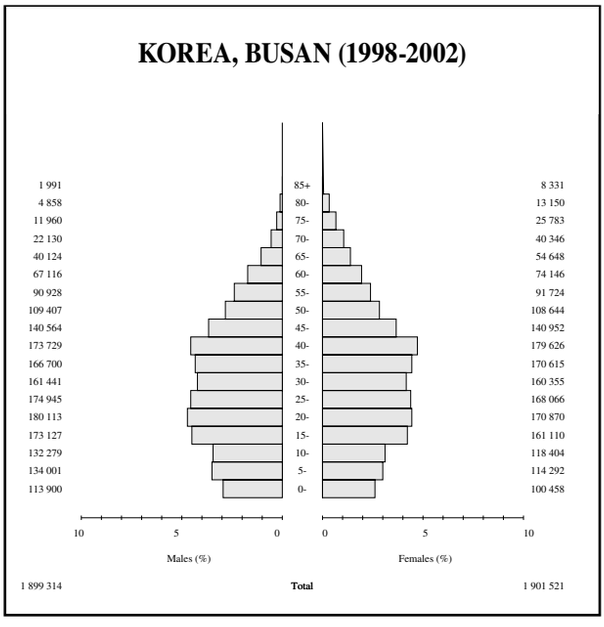
Three part-time medical officers visit 110 hospitals that are currently not notifying cancer patients to the KCCR, and collect the medical records of newly diagnosed cancer patients. They register the cancer cases, which are then scrutinised by Registry faculty members under the supervision of the Registry Director. Death certificates of all cancer patients are obtained annually from the National Statistical Office (NSO), and are compared with Registry files. If a deceased person were not registered, the Registry staff would obtain the appropriate medical records from the hospital where the case was diagnosed and treated.

We are in the process of evaluating the accuracy of stomach cancer data through abstract-reabstract method, and plan to perform the evaluation regularly for additional types of cancers.

Interpreting the results

We collected data according to ICD-O-2, but reported in ICD-O-3 format.

In 2000, most teaching hospitals in Korea could not provide medical service properly for at least for 3 months due to a doctors' strike. As a result, diagnosis and reporting of new cases were delayed, which could decrease the number of 2000 cases and increase the cases reported in 2001.



Even though the "Cancer Act" launched in 2003 clearly stated that cancer registration should be performed to know the burden of cancer; the regulations prohibit accessing personal information based on the personal privacy protection law. The amendment of the Cancer Act to allow access for personal information based on the National Statistics Law is underway. Registration of 2003 cancer cases is ongoing.

The Korean Government began implementing the National Cancer Screening Program (NCSP) in 1999 and has since expanded its target population and target cancers. In 2006, NCSP provides cancer screening for 5 major cancers including stomach, liver (only for high-risk groups), cervical, breast and colorectal cancer. Urologists actively recommend annual PSA testing for men aged over 50. There is no available information on the prevalence of the test; however, most men over 50 receive a PSA test.

Use of the data

The Registry holds an annual conference to report and discuss cancer registration activities in Busan, and invites oncologists from the four University hospitals, representatives of the Association of Anatomical Pathologists and Diagnostic Radiologists, radiation therapists and medical recorders of the Busan hospitals. The President of the Medical Association of Busan and the Chief of the Department of Public Health and Hygiene of Busan City are also invited.

The data are published in an annual report that provides the basic statistics on cancer incidence that may be helpful for evaluating survival of cancer patients. BSCR data, included in the KCCR data, is provided without personal information to researchers as well as other government departments for statistical analysis. The cancer registry data are essential to

evaluate various cancer control programs in Korea, including the National Cancer Screening Program.

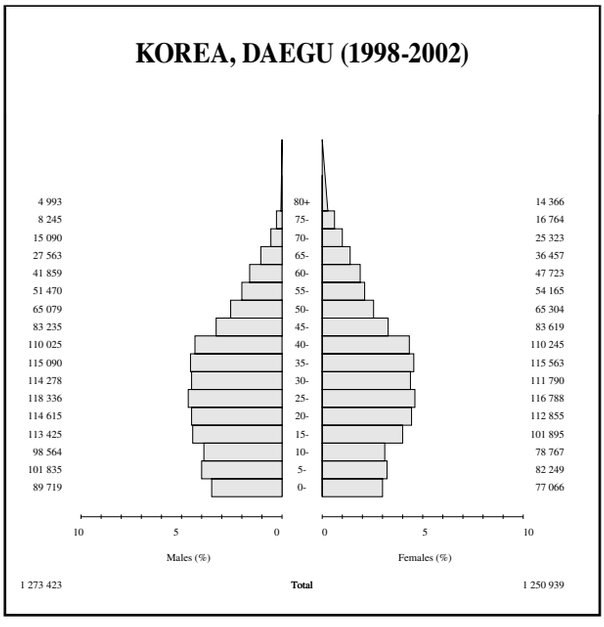
Source of population
The population used to calculate cancer incidences is a mid–year population (the population at the 1st of July), but in this report, the modified resident registration population data that is released annually from the Korea NSO was used.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Korea, Daegu

Registration area
Daegu is an extended metropolitan city in southeastern Korea with a well-defined geographical border surrounded by mountains. It covers an area of 885.56 km². The climate is temperate; it is situated at 128° E and 35° N. The 2000 population was 2 473 990 by 2000 census report. About 6% of the population lives in rural areas. Korea has virtually no ethnic group except Korean, only about 151 000 persons being registered as foreigners nationwide. However, international marriages are increasing rapidly, especially in rural areas. The proportion who had more than junior college education is 18.7%. More than half (52.4%) of Daegu citizens reported practicing a religion in 1995; 33.1% Buddhist, 11.6% Protestant, 6.7% Catholic.

Cancer care facilities
Medical care for the whole population is covered and provided by the National Health Insurance Plan. Daegu has 16 223 hospital beds in 2002, in 74 hospitals (12 general hospitals, 51 hospitals, 9 dental hospitals, and 2 mental hospitals), of which four are university hospitals and 1274 private clinics. There are 4722 doctors including dentists.



Registry structure and methods
Daegu Cancer Registry, financially supported by the Ministry of Health & Welfare, has been collecting new cancer cases in Daegu since 1 January 1997. Located in the Dongsan Medical Centre, Keimyung University, the staff consists of two doctors, one medical records administrator and one medical records technician.

Cancer reporting is voluntary in Korea. DCR receives inpatient cases from the medical record technicians responsible for reporting cases to the Central Hospital Cancer Registry (CHCR), and inpatient cases with an address in Daegu treated outside it direct from the CHCR. CHCR has been collecting cancer cases from major member hospitals in Korea since 1980. The staff of the DCR visits every major hospital dealing with diagnosis and treatment of cancer to find and abstract cancer cases from sources other than inpatients, such as pathology, haematology, CT/MRI, nuclear medicine and radiotherapy medical records. The cases from the other sources in hospitals are followed back to the original medical records to check the addresses, unique Resident Registration Number (RRN) and diagnosis date. The staff also visits private pathology laboratories to review pathology reports and sends query letters to physicians who sent their samples to the laboratory to obtain further information.

After checking for duplicates, the database is matched against two external data sources, the official cancer mortality data and insurance claims. Cases not already in the database become Death Certificate Notification (DCN) cases because death certificates do not contain information that makes follow-back possible. Instead, the RRN is used to clear the DCNs. The DCNs were matched with the databases of the seven major hospitals using the RRN to find out and abstract medical records. Mortality files containing data on all cancer deaths are obtained annually from the Korea National Statistical Office. Cancer cases on insurance claims not matched to DCR data are followed back to the hospitals to confirm the diagnosis. The data are processed using the IARC/IACR CanReg software.

The registry fluctuations in reporting of new cancer cases by institution and source of case-finding are analysed monthly and annually. The registry carries out reabstracting and recoding periodically and uses CanReg to ascertain multiple primaries and DEPedits to see unusual combinations of various kinds. Conventional medical records are being replaced by EMRs (electronic medical records) including inpatient records in some university hospitals. We are establishing a new system to more efficiently collect computerised incident cases.

Interpreting the results
There was no change in area or population covered during 1998–2002. The DCR has been using ICD-O-2 for coding since its inception. However, several doctors' strikes happened during 2000, substantially lowering cancer cases diagnosed that year. DCO% is 4.4 (males 4.5, females 4.4).

Organised stomach, breast, cervical, liver and colorectal cancer screening programmes for persons aged more than 40 began in 1999. However, these programmes are not the same as those in developed countries. Some of their costs are just covered by Government subsidies. During 1999–2002, the uptake rate of the screening tests was very low. We do not collect information on whether a cancer case is diagnosed by the screening or diagnostic tests, so the number of these included in our databases is unknown. PSA testing in Korea is opportunistic; it is usually done as part of Comprehensive Health Checkups but there are no statistics to cite.

Use of the data
DCR is an incidence registry and is not actively collecting survival data on registered cases. It collects vital status when the information is available, for example from medical records, death certificates or the official cancer mortality data. It does not collect stage of disease. Currently, the registry is being used in "Effects of doctors' walkouts on cancer cases diagnosed in 2000 in Daegu", "Estimation of lifetime and age conditional probabilities of developing cancer", "Survival of gastric cancer patients in the young", and "Changes of cancer stages for major cancers in 1997–2003". We are planning to establish an occupational cancer registry as well as a birth defect registry as ramifications of the DCR.

Source of population
The estimates of the population–at–risk are based on the 2000 census, making allowance for births, deaths and migration.

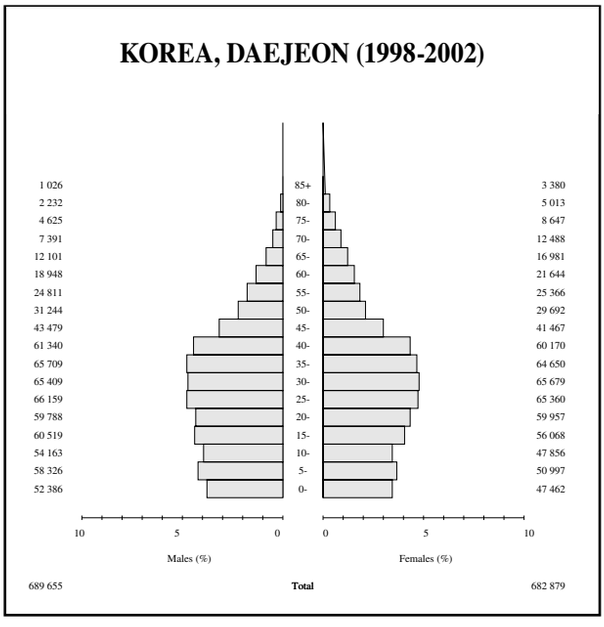
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Korea, Daejeon

Registration area
Daejeon is located in the centre of South Korea: 167.3 km from Seoul, 294 km from Busan, and 169 km from Gwangju. The city is located between 127°33'21" and 127°14'54" E longitude, and 36°10'50" through 36°29'47" N latitude. Daejeon is surrounded by four mountains and located along three major rivers; the city originally developed from farms and houses that were on the hillsides and the valleys between them. The three rivers divide the city's five boroughs: Dong-gu and Daedeok-gu are located east of Daejeoncheon; Jung-gu is between Daejeoncheon and Yudeungcheon; Seo-gu is between Yudeungcheon and Gapcheon; and Yuseong-gu is west of Gapcheon.

Daejeon is the fifth among South Korea's largest six cities, including Seoul, Busan, Daegu, Incheon, and Gwangju. Its population is 1 390 510 and it covers an area of 539.83 km^2 at the end of 2000.

The population is mainly of the Asian race (mostly Korean); religions are Buddhism 26.0%, Christianity 20.6%, Catholicism 5.4% the others 1.6% and no religion 46.5%.



Cancer care facilities
Both public and private sectors provide cancer-related services in this region. General health care in the region is provided by the 9 general hospitals and 20 hospitals (2003). Daejeon cancer registry cooperates with 6 registry hospitals and many non-registry hospitals. There were 4 therapeutic radiology units in 2006.

Also, the Korean government provides the National Cancer Control Programme, mainly related to cancer prevention, screening and supportive-palliative care including National Cancer Screening Program, Terminal Cancer Patient Management, Home-based Cancer Patient Management through National Cancer Center of Korea. Private hospitals provide mainly diagnostic and therapeutic services.

Registry structure and methods
Cancer is not a notifiable disease in Korea; however the Cancer Act (2003) clearly states that cancer registration must be performed to know the burden of cancer. The Daejeon Cancer Registry (DJCR) is a population-based registration that has been in operation since 1998. The registry is located in Medical School of Chungnam National University. A medical doctor, a full-time registrar and one part-time registar staff the registry.

The DJCR is responsible for (1) collection, analysis and management of Daejeon cancer statistics; and (2) analyses and summary of data from Daejeon cancer registries. The data sources for the Daejeon cancer incidence database are the DJCR, the KCCR database, the data from additional medical record review surveys, site-specific cancer registry databases and cancer mortality data for identifying Death Certificate Only (DCO) from the Korea National Statistical Office (KNSO).

In an effort to improve the quality of the KCCR data, an evaluation of data completeness has been conducted, in particular cases diagnosed during 1999–2001 and cases deceased until 2003. We used the flow method developed by Bullard et. al (Br. J Cancer 2000). The flow method is based on the concept that registration is a time-dependent event observed after diagnosis, following a probabilistic approach. The overall 3-year completeness of all cancer was 90.5%, 90.7% in males and 90.3% in females. There were no differences in gender and among different age groups.

We are in the process of evaluating the accuracy of stomach cancer data through abstract-reabstract method, and plan to perform the evaluation on a regular basis for additional types of cancers.

Interpreting the results
We collected data according to ICD-O-2, but reported in the ICD-O-3 format.

To cover cases diagnosed outside Daejeon hospitals, we performed additional medical record review surveys and also supplemented our data with cases from KCCR.

In 2000, most teaching hospitals in Korea could not provide medical service properly at least for 3 months due to doctors' strikes regarding separation of prescribing from drug dispensing. As a result, diagnosis as well as reporting of new cases were delayed, which could increase the reported cases in 2001 as the incidence date is the first date of diagnosis on cancer.

Urologists actively recommend PSA testing for men aged over 50 annually. There is no available information on the prevalence of the test; however, most men aged over 50 receive a PSA test once in their lifetime.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. Some special studies of survival of registered cancer cases will be carried out.

The cancer registry data is essential to evaluate various cancer control programs in Daejeon, Korea including the National Cancer Screening Program.

Source of population
Census and estimate.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Korea, Gwangju

Registration area
Gwangju (formerly transliterated into English as Kwangju) has 1.36 million inhabitants and is situated on the southwestern tip of the Korean Peninsula. The city is the economic, educational and cultural centre of essentially rural surrounding provinces. The rapid transition of the Korean economy from agriculture to manufacturing industries during the authoritarian governments during the past 30 years leaves the area to suffer from low income and emigration of working-age population to the more industrialised parts of the country.

The 1980 uprising proclaiming the democratic government—the Gwangju democratization movement—allegedly made the city politically well known.

There are some manufacturing industries including an automobile assembly plant, though the service industries occupy the majority of the city's workforce.

Cancer care facilities
According to 2002 statistics, the city has 10 general hospitals, 24 hospitals with 7674 hospital beds. Two traditional medicine hospitals also provide palliative services to cancer patients.

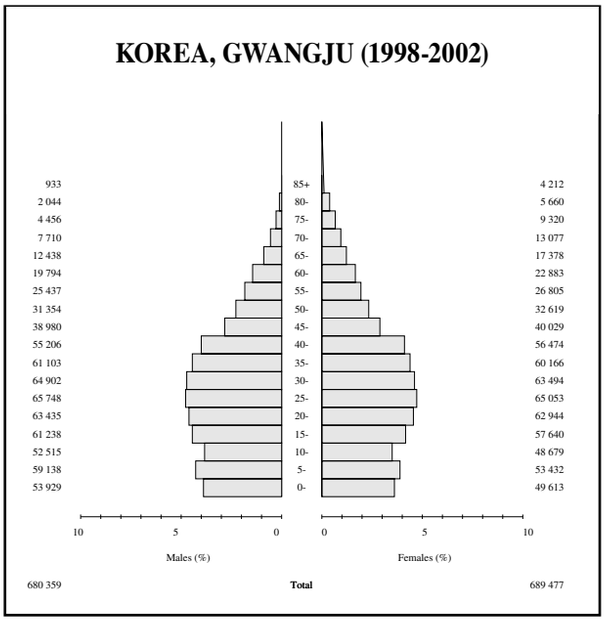
Registry structure and methods
The Gwangju Cancer Registry was established in 1997 after a yearlong feasibility study. The registry is operated by director, part-time medical staff and one or two full-time registrars. The registry has a management committee composed of directors and oncologists of major hospitals and the chief of the Gwangju metropolitan city health department. The committee determines the major direction of the registry activities and cooperates in data collection as well as advocates the registry. There is also a practicum committee composed of hospital medical record keepers to handle the practical details of cancer registration.

The majority of the case information is linked to the Korean Central Cancer Registry (KCCC), which is provided by teaching hospitals throughout the country. The corresponding hospitals in the city provide the data directly to our registry. Data on Gwangju residents registered from hospitals outside of Gwangju city are obtained from KCCC database. The cancer claims data for medical insurance are also used, especially for the non-teaching hospitals. The pathology reports without significant hospital records, outpatient department (OPD) reports and radiation oncology records are also examined for adjuvant information.

The registrar reviews the original information by hospital visit and medical record check. The justified cases are finally registered. Data obtained from outside sources are reviewed with the collaboration of Korean National Cancer Institute and other regional cancer registries.

Death certificate data are obtained from the Korea National Statistical Office. The death certificate data are then merged and verified with the GCR database, teaching hospital records and cancer claims data. Subsequently, the death certificates, which have no linked information, would be treated as death certificate only (DCO).

Our registry has regularly evaluated the completeness and accuracy of information recorded through record linkages with other registries, routine checks using the IARC tool, and reabstracting of medical records.



The Ministry of Health and Welfare of the Korean government provides financial support.

Interpreting the results
In Korea, there are five national screening programs for stomach, colorectum, breast, uterine cervix, liver cancer. PSA testing has increased during this period even though it is not involved in routine screening for cancer, and its influence on the prostate cancer incidence is not clear. ICD-O-2 was used for years 1998–2002; for incident cases from 2003, ICD-O-3 has been used.

Use of the data
The cancer incidence and other statistics contained in the annual report are recognised as official public data of Gwangju metropolitan city.

Each year the Registry submits the annual report to the City Hall. The City Hall then makes a public announcement of the statistics and distributes copies to the relevant agencies. Local health departments and public health centres use Registry data for planning or evaluation of their health services. We permitted access to our registry database for public health and clinical study, if not conflicting with our confidentiality guidelines.

The Registry has participated in some epidemiological study for regional difference of cancer, such as thyroid cancer.

Follow-up for survival of cancer patients and publication of an English version of the annual report are under consideration.

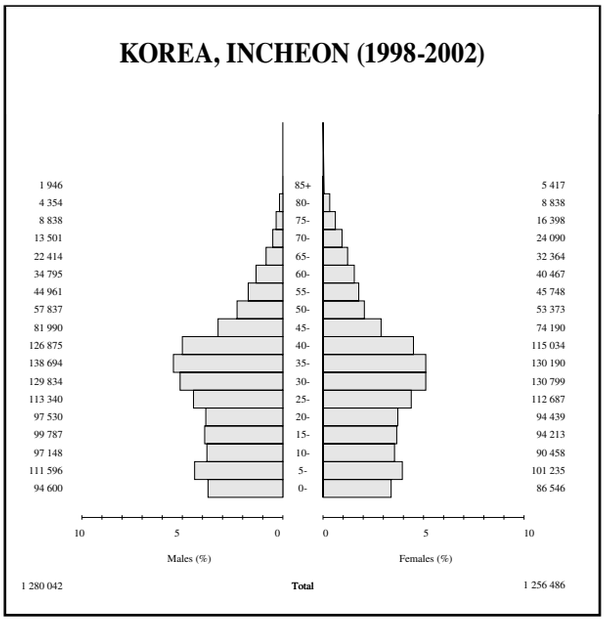
Source of population
1998, 1999, 2000, 2001, 2002: Registered population; the statistics of registered population (Gwangju city, 1999, 2000, 2001, 2002, 2003).

Multiple primary rules used
IACR rules (2004) on historical data.

Korea, Incheon

Registration area
Incheon is the third largest city in South Korea and is located on the western part of the Korean peninsula with the sea to the west and metropolitan Seoul to the east. It is an industrialized city with a well-established medical delivery infrastructure. The population of the city according to social-ID registration by Statistics of Incheon city was about 2.63 million in December 2005. Most of the population is Korean (98.6%).

Cancer care facilities
More than 100 medical institutions are in Incheon, and three university hospitals are available in diagnostic and treatment service for cancer. Patients suspected to have cancer in the primary and secondary care facilities are mostly referred to one of the three University hospitals. Two hospitals have all cancer treatment facilites, 10 have chemotherapy, 3 have radiotherapy and 46 have surgery.



Registry structure and methods
The Incheon Cancer Registry was organized in 1997 by Inha University Hospital in collaboration with the Korean Central Cancer Registry (KCCR) and is incorporated in the International Association of Cancer Registries.

Financial support is provided primarily by KCCR and partly by Inha University Hospital. ICR was composed of 7 members, 5 from Inha University Hospital and 2 from GachunGil hospital.

There are four main sources of cancer registry in ICR. The primary source of the ICR data is the registry files from the KCCR (Korean Central Cancer Registry) at National Medical Center, which are transferred from each regional cancer registries including ICR, allowing ICR to collect cancer cases diagnosed in Incheon as well as outside Incheon. The secondary source was cancer cases registered at non-KCCR hospitals in Incheon. Others come from health insurance documents (medical insurance claims) and death records from the National Statistic Office.

Trained medical record administrators (MRA) review the inpatient and outpatient medical record including pathologic, radiologic and endoscopic reports. To collect the death certificate cases from death records, ICR has applied the public-health personnel with the support of Incheon city officials, and has performed mail research to identify cancer patients from the hospitals which had identified the patient as having died of cancer.

ICR primarily classifies cancer patients by ICD-O-3 and multiple cancer and other specific classifications in accordance with the KCCR guidelines based on IARC manual. ICR uses its own registration format, which has more mandatory and optional items than KCCR's, and removes duplications and errors from the data by an ICR computer programme.

Follow up information is obtained predominantly by passive methods. These include obtaining cancer mortality information from death certificates in the Vital Statistics section. The mortality data are periodically matched with the incident cancer database using the National Identity number. The vital status of the unmatched incident cases is also ascertained by review of medical records. However, all incident cases for which death information is not forthcoming are presumed to be alive on the last day of the year for which the mortality data are fully utilised for matching.

Interpreting the results
National cancer screening programs have been applied for cervix and lung cancer. The incidences of prostate cancer have been very low as compared to other developed countries, so the national cancer screening program did not cover PSA test for detection of prostate cancer. Many individual hospitals employ PSA testing on a case-by-case basis.

Use of the data
We report the incidence of cancer annually by site, sex and age excluding extent of disease or survival to the government. Policymakers in government use regional cancer registry data, including Incheon Cancer Registry, for developing health services or laws.

Source of population
1998, 1999 estimated, Annual statistics of Incheon city on Registration of Social Identification. 2000 National Census. 2001, 2002 estimated, Annual statistics of Incheon city on Registration of Social Identification.

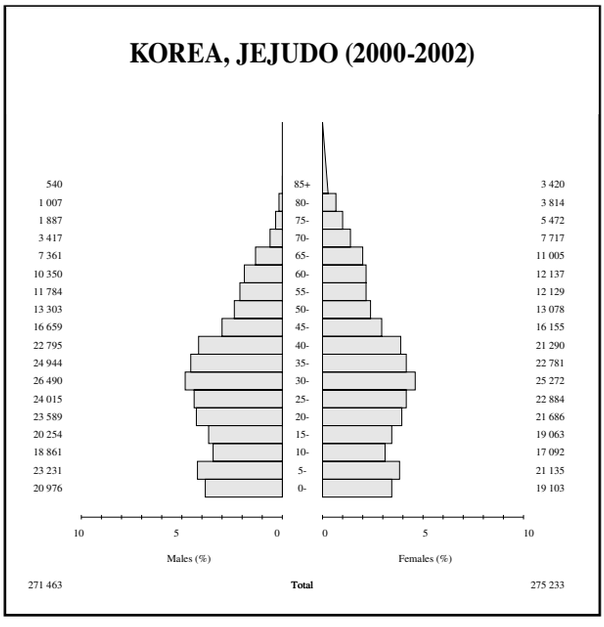
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Korea, Jejudo

Registration area
The Jejudo registry covers the population of Jejudo Island, which is situated in the southern part of Korea peninsula, between latitudes 33° and 34° N and longitudes 126° and 126° E, and is the largest island in South Korea with a total area of 1848 Km^2. The island came into existence 700 to 1200 thousand years ago when lava spewed from a sub-sea volcano and surfaced above the waters. The annual mean temperature reaches 17°C and the annual rainfall is about 1676 mm. It is famous as the "clean island" in Korea because there are no industrial factories giving rise to air and/or environmental pollution.

The population as of 2001 was 546 696. Of the economically active population, 71% is engaged in the service industry, 25% in agriculture including fishing, and 4% in industry.

The religious distribution in residents is as follows: Buddhist 36%, Christian 17%, Confucian 3%, and atheist 44%. Almost all of residents are Korean; the proportion of foreigners is 0.1%. Thus, we exclude events of cancer incidence in foreigners.



Cancer care facilities
Medical care for the whole population is covered and provided by the National Health Insurance (NHI) Plan. All six hospitals (two general and four private) on the island can diagnose cancer. However, one general and one private hospital among them can treat cancer patients because only these two hospitals have oncologists and cancer treatment facilities including radiotherapy departments. Hospital beds in these hospitals total 1528, approximately 2.8 beds per 1000 residents.

Registry structure and methods
Jejudo Cancer Registry (JCR) has been collecting new cancer cases occurring in Jejudo since 1 January 1999. It is located in the Cheju National University College of Medicine (CNUMC). It receives financial support from the Korean National Cancer Control Program, and is administratively supported by the Department of Public Health and Sanitation of Jejudo Provincial Government.

The Ministry of Health and Welfare (MOHW) established the nationwide, hospital-based Korea Central Cancer Registry (KCCR) in 1980. According to the KCCR program, the medical records department of nationwide teaching hospitals notifies all in-patient cancer cases voluntarily. In 2000, a pilot study was conducted to expand the pre-existing hospital-based registry into a population-based registry for Jejudo. It was found that 78% of the total incidental cancer cases could be registered using the KCCR data and that the remaining 22% could be collected by active registration.

There are two staff in the registry. The chief, taking total responsibility for the operation the registry, has majored in epidemiology. The other staff member is a medical recorder who visits the regional hospitals that are able to diagnose cancer; reviews medical charts, and gathers information about cancer incidence.

Among the six hospitals in Jejudo, two teaching hospitals report all inpatient cancer cases as well as some outpatient cases to KCCR. The KCCR annually offers information to the JCR on the cancer patients with an address in Jejudo at the time the initial diagnosis of cancer is made. Another source of registration is an active search by the registrars for cancer patients diagnosed in the non-KCCR registered hospitals in Jejudo. The registrar visits these hospitals to review and abstract medical records of potential cancer patients who appear in the list of cancer claims submitted to the NHI. This list also serves as a good source for tracking the identity of cases notified by a death certificate alone.

Death certificates for all cancer patients are obtained annually from the National Statistical Office, and are compared with the file entries of cases in the registry using the unique Resident Registration Number (RRN). The cases not already registered in the databases become Death Certificate Notification (DCN) cases. For the DCNs, the registrar searches and reviews medical records from the six hospitals using RRN.

The JCR evaluates the validity of the registry data with the IARC CHECK program and re-abstracts the medical records to check for errors in the data.

Interpreting the results
There was no change in area or population covered during the period of 2000–2002. The JCR has been using ICD-O-3 for coding since its inception, and there has been no change in case definition and coding.

The NHI in Korea supports a biennial cancer screening program for all Korean people aged above 40 years, including Jejudo residents. The sites covered by the programme are stomach by endoscopy, colon by colonoscopy, breast by mammography, uterine cervix by Pap smear test, and liver by ultrasonography. PSA testing is not common but is feasible as it is not expensive.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes in Jejudo, Korea. Some special studies of the utilisation pattern of medical services in the registered cancer cases have been carried out.

Source of population
Census.

Multiple primary rules used
Impossible to detect multiple primaries.

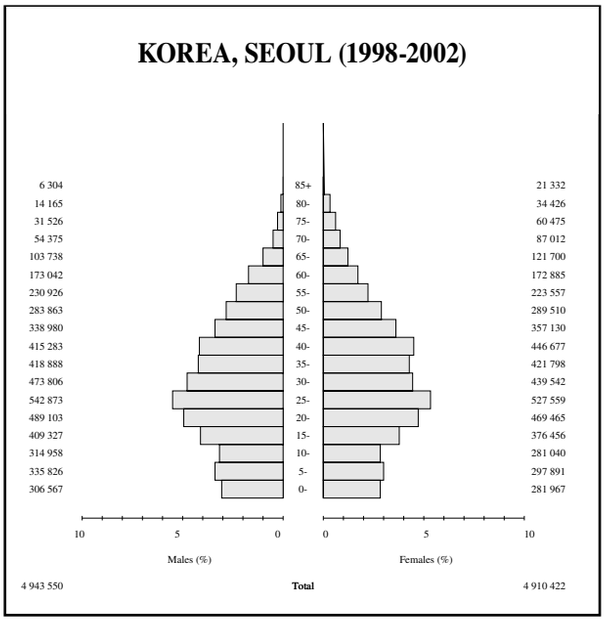
Korea, Seoul

Registration area
The Seoul Cancer Registry (SCR) covers the population of Seoul Metropolitan city, the capital of the Republic of Korea. The population at the most recent census (2001) was 10 263 336, about 21% of the total population of the country.

The Korean population is very homogeneous, with a very small Chinese minority of around 20 000. Traditional culture is mostly based on Confucianism, while Buddhism (25%) and Christianity (19%) are two of the most vigorous religions.

Cancer care facilities
Cancer care in the region is provided predominantly by large teaching hospitals and mid-sized hospitals, numbering 63 and 117, respectively, in 2003.

There are also 5948 clinics and 25 community health centres, but cancers are rarely confirmed in these facilities. Patients suspected to have cancer in primary clinics and community health centres are referred to one of the teaching hospitals, except for some elderly patients who decline further medical work-ups. This might cause incomplete registration among the elderly, unless the elderly cases are captured through the death certificates. Ninety-nine percent of cancers occurring in Seoul are treated in Seoul, and about 76% of patients treated in Seoul are from outside the city.



Apart from these facilities, there are 2545 clinics and hospitals practicing traditional oriental medicine. Although most cancer patients resort to western medicine eventually, some patients would only go to these traditional oriental clinics. These patients are not registered to SCR unless they are captured through the death certificates.

Registry structure and methods
The SCR is located in the Department of Preventive Medicine, Seoul National University College of Medicine, and in the Department of Social and Preventive Medicine, Sungkyunkwan University School of Medicine. It is funded by the Ministry of Health and Welfare. There are two part-time medical officers, one data manager, and four full-time registrars.

The SCR uses several sources of data finding. About 87% of the SCR data are registered through the Korean Central Cancer Registry (KCCR). KCCR is operated by voluntary registration from teaching hospitals throughout the country.

The second source of registration is active case finding by the registrars. The registrars make visits to about 81 mid-sized hospitals to review and abstract medical records of potential cancer patients who made insurance claims for cancer to the Association of Korean Medical Insurance. The insurance claim data also serves as a good source for tracking the identity of cases notified by a death certificate alone.

The third source is the death certificates to find the vital status of the registered cases and to register the Death Certificate Only cases (DCO). Death certificates from the National Statistics Office (NSO) cover all deaths occurring in Korea and include the full National Identity Number issued by the Korean Government to every Korean citizen at birth. The quality of death certificates in Seoul is good, about 98% being certified by medical doctors.

Using both the health insurance data and mortality data further enhances the completeness of the registration.

The SCR evaluates the validity of the registry data with the IARC CHECK program and re-abstracts the medical records to correct the errors in the data.

Interpreting the results
The size of the population and the number of medical facilities to be covered make it necessary to accept the data from KCCR pre-coded by many medical recorders from each hospital. Although the Association of Medical Recorders continuously instructs its members on cancer registry methods, the process still calls for a constant evaluation of the validity of the registry data.

Around 1998, opportunistic screening for breast and thyroid cancer started to become popular among women. The rapid increase in thyroid cancer among women could be accounted for by this change in screening rate.

Uses of the data
The registry produces reports on cancer incidence by sub district in Seoul, Korea. A special study of survival for all cancers has been carried out.

Source of population
Seoul Population Census : 2000

Multiple primary rules used
IACR rules (2004) on CI5 IX period

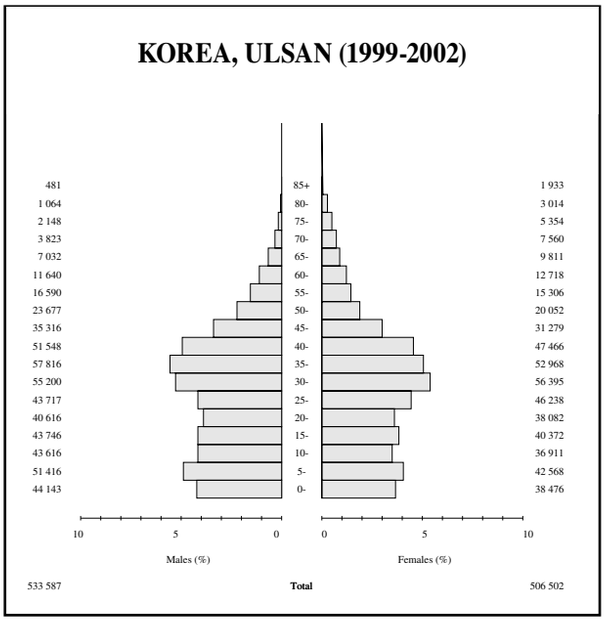
Acknowledgement
We thank Dr. Jae-Gab Park and Dr. Keun-Young Yoo, the former and current President of National Cancer Center in Korea, for their support to SCR.

Korea, Ulsan

Registration area
The Ulsan Cancer Registry (UCR) covers the population of Ulsan metropolitan city in Korea. Ulsan is a representative port city located in southeastern region of Korea. It covers an area of 1056.7 km^2. The population at the most recent census (2000) was 1 012 110. About 84% of the population (>850,000 inhabitants) lives in urban areas. In general, Korea has virtually no other ethnic group except Korean and only 2318 persons are registered as foreigners in Ulsan.

The annual mean temperature in Ulsan is 14.3° C, and annual rainfall is about 1272 mm.

Ulsan has become a rapidly industrialised city, accounting for 12.2% of the manufacturing industry in Korea. The main industries are the petrochemical, shipbuilding, and automobile industries.



Cancer care facilities
Medical care for the whole population is covered and provided by the National Health Insurance Plan. In 2004, Ulsan had 7279 hospital beds and 39 hospitals (2 teaching hospitals, 1 general hospital, 23 hospitals, 2 dental hospitals, 3 psychiatric hospitals, 4 sanatorium hospitals, and 4 traditional medicine hospitals), of which one is a university hospital, and 912 private clinics. The university hospital provides cancer surgery, chemotherapy and radiotherapy services.

Registry structure and methods
The registry is located in the department of occupational and environmental medicine, Ulsan university hospital, and is funded partly by Ministry of Health and Welfare, and partly by the city's health department. Two part-time medical doctors and one full-time registrar staff the registry.

Approximately 79% of the cases are registered from the data files of the Korean Central Cancer Registry (KCCR). The KCCR identifies incidence from cancer cases in Korea through the nationwide hospital-based discharge system. This hospital-based database covers all general hospitals in Korea.

The second source of registration is the list of cancer cases from claims made through the National Health Insurance Corporation.

The third source is the death certificates. The cases not already registered in the UCR database become Death Certificate Notification (DCN) cases. Death certificates from the National Statistics Office (NSO) cover all deaths occurring in Korea and include the unique Resident Registration Number (RRN) issued by the Korean Government to every Korean citizen at birth. The RRN also serves as a good indicator for tracking cases notified by death certificate alone.

In addition to these three major sources, several secondary data sources, such as log files from pathology laboratories and radiotherapy departments, help to identify unregistered cancer patients.
The UCR evaluates the validity of the registry data with the IARC CHECK program and re-abstracts the medical records to check for errors in data. A formal evaluation of the data is done in collaboration with the Korean National Cancer Centre.

Interpreting the results
There has been no change in area or population covered by the UCR during the period 1999–2002. The UCR has been using ICD-O-2 for coding since its inception, and there has been no change in case definition and coding.

There are 5 cancer screening programs in Korea, namely cervix, breast, prostate, stomach and liver. If prostate cancer is suspected or if symptomatic of BPH, then PSA testing is regularly performed.

Use of the data
The registry produces annual reports on cancer incidence and mortality in Ulsan. The data have been used for several epidemiological studies on primary, secondary and tertiary prevention of cancer. The registry is especially interested in monitoring occupational cancer.

Source of population
The estimate of the population–at–risk is based on the 2000 census, making allowance for births and deaths, but it was not possible to estimate migration into and out of the registration area.

Multiple primary rules used
IACR rules (2004) on CI5 IX period

Kuwait

Registration area

Kuwait is one of the major oil-producing countries in the Middle East, with a surface area of 17 818 km^2, and is situated in the northwestern corner of the Arabian Gulf. The mainland is flat sandy desert with a scattering of oases. There are a few rocky hills ranging from 180 to 300m above sea level. Kuwait experiences wide variation in temperature, ranging from an average of 45ºC in July to an average of 8ºC in January. There is also wide variation in annual rainfall, ranging from as little as 22 mm to 350 mm. This falls almost entirely between November and April.

Kuwait has experienced rapid social and economic development over the past four decades. It is a society undergoing demographic and epidemiological transition. For Kuwaiti nationals, these changes have included important declines in infant mortality (11.4/1000 live births) and improvements in life expectancy (75 years). Kuwait also has one of the highest annual population growth rates in the world (4.5%) and has greatly increased the literacy rate to about 85%.

The total population in 1995 was about 1.88 million: 37% are Kuwaiti nationals and 63% are non-Kuwaitis (expatriates). Expatriates living in Kuwait are a heterogeneous and transitory group representing over 50 countries. However, it is noteworthy that the vast majority (95%) are from Southeast Asian and Arab countries. In 1994, Southeast Asians (from Afghanistan, Bangladesh, India, Iran, Pakistan, Philippines, and Sri Lanka) represented 58% and Arabs (from Egypt, Jordan, Lebanon, and Syria) 37% of the expatriate population. Compared with countries in Europe and North America, Kuwait has a relatively young population structure: about 44% of Kuwaitis and 17% of non-Kuwaitis are aged <15 years.

Cancer care facilities

For administrative purposes, the country is divided into five health regions: Capital, Hawali, Al-Farwania, Al-Ahmadi, and Al-Jahra. The medical services in each health region comprise a number of primary/family healthcare clinics, which provide general, maternal, child and dental healthcare services, and a general public hospital. Besides these facilities, there are a number of centralised specialist hospitals including Kuwait Cancer Control Centre. The centre was established in 1982 and is the only specialised cancer treatment hospital in the country. It offers modern facilities for cancer diagnosis, treatment and follow-up.

Registry structure and methods

The Kuwait Cancer Registry was established in 1971 in the Radiotherapy Department at the Al-Sabah hospital. The initial purpose of the registry was to study the incidence and morphology of cancers in the Kuwaiti population and to use this information as the basis for establishing a comprehensive cancer centre for diagnosis, treatment, follow-up and care of cancer patients. Subsequently, the Kuwait Cancer Control Centre was established in 1982 and the registry became a separate department of the hospital.

Notification of cancer is compulsory through a Ministerial Decree. Cancer registrations are fairly comprehensive as almost all cases not initially diagnosed or treated at the Kuwait Cancer Control Centre (including those who receive initial treatment at other hospitals or abroad) are ultimately referred to the centre for further treatment or follow-up. The registry maintains a separate alphabetical and numerical index, which includes information such as case note number, name, age, sex, nationality, year of diagnosis, and site. Pathology reports and death certificates are filed numerically by year. All new registrations are checked against these data items to avoid duplication.

The sources of information are: case notes from the Cancer Control Centre and other hospitals; reports from the pathology departments of the Cancer Control Centre and of other hospitals; and mortality data from the Vital and Health Statistics Division of the Ministry of Health. All coding (topography, morphology, TNM classification, etc.) and computerisation of data is done by the registry staff. The registry is staffed by a director, a medical officer and an administrator, two cancer registrars, and one medical records clerk and two computer technicians.

Use of the data

The data are used for monitoring trends in incidence and in research. They are also used for planning and evaluation of cancer care facilities. The registry is especially interested in monitoring any change in the incidence of cancer that may have occurred following the Gulf War in 1991.

KUWAIT: KUWAITIS (1998-2002)

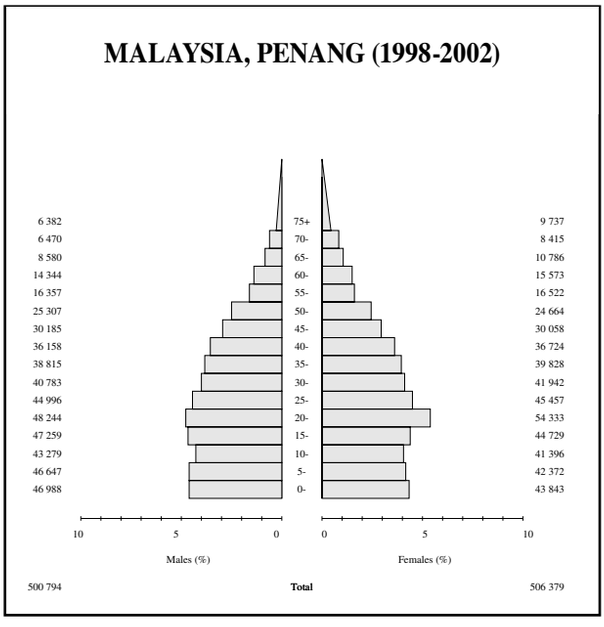
Impossible to detect multiple primaries.

Malaysia, Penang

Registration area
The Penang Cancer Registry covers the population of 5 districts (Timur Laut, Barat Daya, Seberang Perai Utara, Seberang Perai Tengah and Seberang Peri Selatan) within the state of Penang, in the northwestern part of the Malaysian peninsula. The population at the most recent census (2000) was 1 313 449, with 79.6% of the population living in urban areas. Penang has a higher population density than the rest of the country.

The ethnic composition and socio-economic profile of the Penang population differs from the other states within Malaysia in that Penang has a better economic attainment and higher per-capita income than most other states. It also has a higher proportion of Chinese residents than the rest of the country, with an overall ethnic composition of 53.4% Malays, 26.0% Chinese, 7.6% Indians and 12.9% others (Department of Statistics, 2001). The official religion is Islam.



Cancer care facilities
Both the private and the public sector, through a network of regional hospitals, provide general health care in the region's district hospitals with and without specialists and a network of primary health centres. In addition there are 11 private hospitals in the state and 426 General practitioners. All modalities of treatment for cancer are available in Penang. However, radiotherapy services are only available at Mount Miriam Hospital and at Pantai Mutiara Hospital. Mount Miriam Hospital is the regional cancer centre for Northern Peninsula Malaysia.

Registry structure and methods
The registry is located within and funded by the State Health Department. An epidemiologist, nurse, 2 clerical staff and part-time clerical staff (when the need arises) staff the registry. In addition, nurses from each of the districts also assist in active case detection. Strict confidentiality is maintained at all times at the registry.
The Penang Cancer Registry uses both active and passive finding methods. Active case finding and routine checks are done using public and private hospital discharge records, as well as pathology record listings from the public and private laboratories, to ensure completeness of data. Registry staff visit the sources of data to extract required information. The registry also relies on other healthcare workers to complete notification forms and forward them to the registry. This is supplemented by case detection from death records supplied by the National Registration Department. All possible sources of data in the State are identified. Arrangements are also made with other hospitals outside the registration area to notify the registry of resident cancer cases that are diagnosed and treated there.

The Cancer Registry Committee and the State Technical Committee evaluate the completeness and accuracy of the information.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed. However, Penang's health coverage is very extensive even in the remotest areas, and a full range of diagnostic and treatment facilities are available here, so it is very unlikely that any referred cases will be missed.

Screening services for cervical cancer and a breast self examination programme are routinely carried out by the primary healthcare facilities. Extensive screening services are also provided by the private sector. PSA testing is offered by all the private hospitals for a fee, and in general hospitals only when indicated.

Use of the data
The registry has prepared annual statistical reports for the years 1994, 1995, 1996 and 1997 as well as two 5-year reports (1994–1998 and 1999–2003). The reports highlight trends and changes. The data are used for planning and evaluation of cancer control programme in the state, and are also used by universities for specific research.

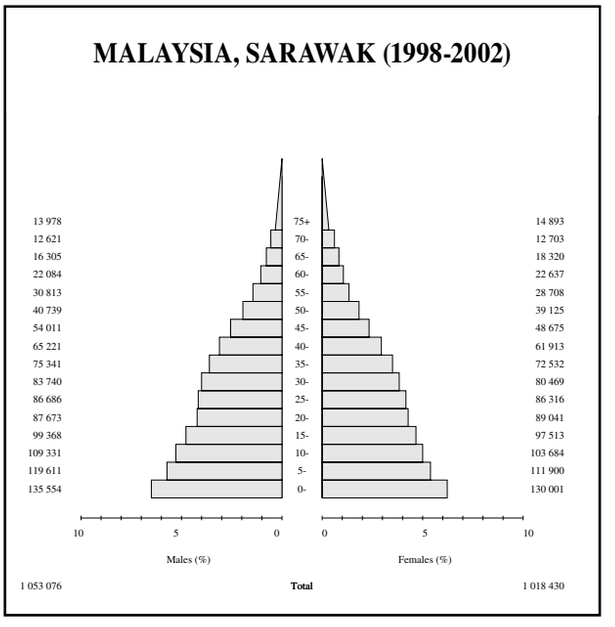
Source of population
1999: projection from 1991 census. 2000: census. 2001, 2002: projection from 2000 census.

Multiple primary rules used
IACR rules (1990).

Malaysia, Sarawak

Registration area
The Sarawak Cancer Registry is a population-based cancer registry that commenced data collection on 1 January 1996. The registry covers the population of 11 divisions (Kuching, Sri Aman, Sibu, Kapit, Miri, Limbang, Sarikei, Bintulu and Samarahan, Mukah and Betong Divisions) in the state of Sarawak in Malaysia. The population at the most recent census (2000) was 2 071 506. About 48% of the population lives in urban areas; ethnic composition is 30.0% Iban, 26.7% Chinese, 23.0% Malays, 8.3% Bidayuh, 5.9% other Indigenous, 5.6% Melanau and 0.4% other ethnic Groups

Cancer care facilities
General health care in Sarawak is provided predominantly by the Sarawak Health Department, through the district hospitals and a network of primary health centres. Private practitioners and hospitals supplement this. Radiotherapy service in Sarawak is only available at the Sarawak General Hospital in Kuching. Patients who require radiotherapy treatment are referred to the Sarawak General Hospital for treatment. Furthermore, as this is the only hospital providing radiotherapy services in the State, the likelihood of cancer patients seeking radiotherapy treatment beyond the catchment area of the registry is minimal.



Registry structure and methods
The registry is located in the Non-Communicable Diseases Control Section of the Sarawak Health Department, and fully managed and fully funded by the Sarawak Health Department. A full-time medical officer, two full-time registrars and a part-time registrar staff the registry.

Cancer registration is based primarily on voluntary notifications. The registry seeks basic epidemiological and clinical data for all cancers diagnosed in Sarawak since 1 January 1996. The registry receives notifications in a standardised format from all sections of the medical profession in Sarawak. Active case finding and routine checks are made of government and private hospital discharge records as well as pathology record listings from the public and private laboratories to ensure completeness of the data.

This is supplemented by case detection from death records supplied by the National Registration Department.

In order to ascertain high coverage and accuracy of data, the Sarawak Cancer Registry team performs several quality control checks. These include sourcing out missed cases, identifying multiple notifications and inaccurate information and inspecting case notes of discharged cancer patients in all government hospitals in Sarawak. Although cancer is not a notifiable disease, a fair number of registration forms are received from private practitioners.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but underestimation could occur for elderly subjects in rural areas. Health services in Sarawak have a full range of diagnostic facilities, so that it is unlikely that cases referred will be missed. Screening service for cervical cancer is ongoing and provided by the primary health centres. While there is increasing interest in PSA testing, it is not routinely done in our population.

Use of the data
The registry had published the 1996–2000 cancer report highlighting incidence of cancer in Sarawak by gender, age and ethnic group. The data from the cancer registry are being used for planning and evaluation of health services. The registry is currently developing a cancer atlas for Sarawak and analysing cancer survival in Sarawak.

Our registry is currently doing research on the geographical distribution of common cancers in our population, such as nasopharyngeal carcinoma, colorectal cancer, breast cancer and cervical cancer. Preliminary results of the research on the geographical distribution of nasopharyngeal carcinoma in Sarawak were presented as part of the paper “Epidemiology of Nasopharyngeal Cancer in Sarawak”, presented at the Beijing IACR Meeting. Our registry is currently working on a proposal for research into screening for nasopharyngeal cancer in Sarawak.

Source of population
1998, 1999: projection from 1990 census. 2000: census. 2001, 2002: projection from 2000 census.

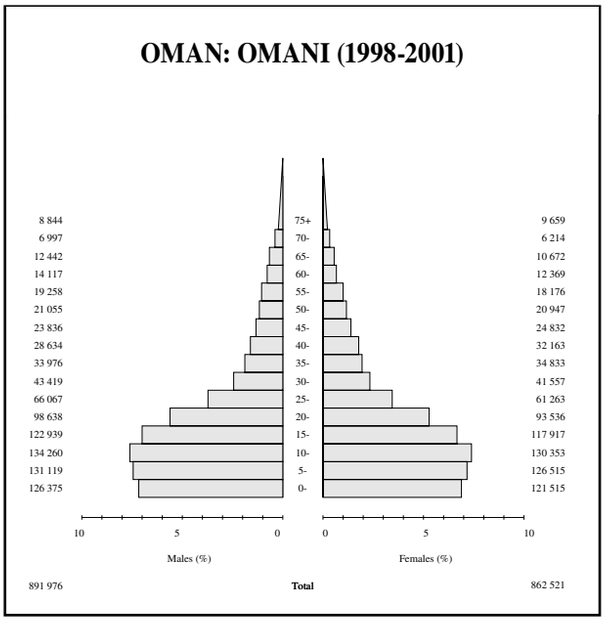
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Oman

Registration Area

The Sultanate of Oman is located in the southeastern corner of the Arabian Peninsula. It has a costal line extending almost 1700 km from the Strait of Hormuz in the north to the borders of the Republic of Yemen in the south and overlooks three seas; the Arabian Gulf the Gulf of Oman and the Arabian Sea. The Sultanate of Oman borders the Kingdom of the Saudi Arabia and United Arab Emirates in the west, the Republic of Yemen in the south, the Strait of Hormuz in the north and the Arabian Sea in the east. There are a number of scattered Omani islands in the Arabian Sea; the most important are Masirah and Al Halaniyat.

The total area of the Sultanate of Oman is approximately 309 500 km^2, making it the second largest country in the Arabian Peninsula. The Sultanate is composed of varying topographic areas consisting of plains, wadis (dry river beds) and mountains. The most densely populated and agriculturally fertile area is plain overlooking the Gulf of Oman and the Arabian Sea (3% of the total area). The mountain ranges occupy almost 15% of the total land of Oman and are inhabited by about 5% of the population. The remaining area is mainly sand, wadis and desert (about 82% of the total area). The climate differs from one area to another: it is hot and humid in the coastal areas in summer, hot and dry in the interior with exception of higher mountains and southern regions of Dhofar, which enjoy a moderate climate throughout the year.



Based on the 1993 census the estimated Omani population in 1998 was 1 684 850. Based on a second census conducted in 2003, the estimated Omani population in 2004 was 1 802 931. In 2004 about 12% of the population was under 5 years of age and 40% were under 15 years. Only 3.1% of the total Omani population was above the age of 60 years. There were 102 males for every 100 females.

Patients are classified as nationals and non-nationals. However, no data is collected on ethnic background of patients.

Registry Structure and Methods

The cancer registry in Oman was established in 1985 in Al Nahdha Hospital as a hospital-based registry. In 1996 it was moved to the Department of Non-Communicable Diseases Control at the Ministry of Health Headquarters. Since then the Oman National Cancer Registry has functioned as a population-based registry covering the entire Sultanate of Oman and is staffed by two part-time epidemiologists and two full-time cancer registrars. Cancer notification forms were modified and distributed to all regional hospitals and sister institutions for reporting.

Sources of cancer information for the Registry include passive reporting by the diagnosing physicians from different hospitals including University, Police and Armed Forces Hospitals, histopathology and cytology reports from the five main laboratories in the country and the outpatient logbooks and radiotherapy and chemotherapy appointment lists of the Oncology Department at the main tertiary facility, the Royal Hospital. In addition, discharge diagnosis and monthly hospital mortality lists of patients with diagnosis of cancer are obtained from different hospitals in the country.

In December 2004 radiotherapy services became available in Oman in addition to the other modalities of treatment, which already existed. This minimised the number of patients sent abroad for treatment and provided the registry with an extra source of cancer notification. Details of the patients sent abroad for treatment (mainly for radiotherapy) were obtained from the Department of Treatment Abroad and from Tuwam Hospital (main referral hospital for radiotherapy in the neighbouring United Arab Emirates).

Between 1985 and 1997, the registry used Dbase software for data entry. In 1998 the whole database converted to the IARC/IACR CanReg software programme.

Interpreting the results

Opportunistic screening activities are ongoing for cervical cancer. However there are no organised screening programmes yet. PSA testing is not common in the population.

Smoking is on the increase in Omanis, and many industries are promoted now, both of which could result in an increase in the incidence of cancer.

Source of population

Data for 1998–2001 are annual projections based on the Cohort Component Technique, using the West UN life table model and based on the 1993 census.

Multiple primary rules used

IACR rules (1990).

Notes on the data

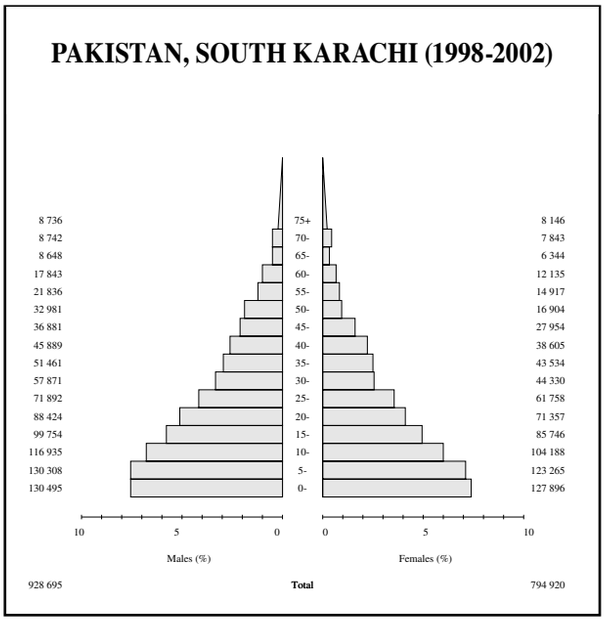
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Pakistan, South Karachi

Registration area

Karachi is the largest city of Pakistan, an Islamic Republic in south central Asia and the capital of Sindh province. Located on coast of the Arabian Sea, at latitude 24° 51' N, longitude 67° 02' S, it is the nation's major commercial and industrial centre as well as the largest seaport. The city covers 591 km^2 while the metropolitan area covers 1450 km^2. The city of Karachi is divided into 5 districts. The Karachi Cancer Registry (KCR) registers incident cases of the southernmost district of the city. Karachi South has a year-2000 population of 1 723 617; males 928 695 and females 794 922. The population is urban.

Karachi is a multi-ethnic city. The dominant ethnic group in Karachi is the Urdu-speaking Muhajirs; the other large groups include the Sindhis, Balochis, Punjabis, Pashtuns, Kashmiris and Seraikis. There is a refugee population that includes Afghan, Pakhtuns, Tajiks, Hazaras, Uzbeks, and Turkmens. There are also Bengali, Arab, Iranian and African immigrants, and a large community of Zoroastrian-Persian Parsis and Goan Catholic Christians. The linguistic distribution of population was: Urdu-speaking 48.52%; Punjabi 13.94%; Sindhi 7.22%; Pushto 11.42%; Balochi 4.34%; Seraiki 2.11%; others 12.4%. Most inhabitants are Muslim (96.49%), with some Christians (2.35%), Hindus (0.83%) and Qadiani (0.17%).



Karachi South is a sample population of Pakistan, having an equal distribution of the major ethnic groups and all the minority groups of the country. The population distribution of KS and Pakistan are similar as regards age, gender and religion. The male preponderance reflects the in-migration for work from other regions of Pakistan i.e. Sindh, Baluchistan, NWFP and Punjab. These men are residents of the district, as they spend an entire life in Karachi, going back to their village only during their annual or bi-annual leave.

Cancer care facilities

Karachi South has 2 provincially administered tertiary care public health hospitals and 1 armed force administered hospital, one with a radiotherapy facility, that provide free to subsidized surgery and diagnosis. The Aga Khan University had 6 diagnostic centres in the district during the reference period. Other private medical facilities provide surgical and diagnostic facilities but provide less-than-optimal quantitative medical oncology or radiotherapy treatment cover, as the tertiary care facilities are also shared by numerous referral cases from across the Province of Sindh. Thus the majority of the cancer patients utilise services outside the district, city or even the country.

Registry structure and methods

The Karachi Cancer Registry (KCR), the first population-based registry in Pakistan, has been philanthropically funded for 12 years. It has 6 permanent staff members and many volunteer workers in 2 offices at the Sindh Medical College and Aga Khan University (pathology department).

Data collection is a combination of active search, passive notification, and automated notification. The principal source of information on cancer cases is the diagnostic centres of the Aga Khan University.

The registry has access to death certificates with personal identifiers. This source has limited value as the cause of death registered is non-specific. Cancer is not a notifiable disease and problems of 'confidentiality' are high with major centres, e.g. the Aga Khan University.

Quality control

The data are classified using ICD-O3 and computerised using a customised version of CanReg-4, with internal checks on the validity of entered data. Manual and computerised validity checks for the cancer data were performed as per IARC and IACR recommendations. This involved factors influencing comparability, i.e. classification and coding. Demographic variables recorded were the hospital patient-number, date of incidence, name, age, sex, address, ethnicity, topography, morphology, grading and staging.

Interpreting the results

Private sector input has significantly increased and altered the contribution from data sources. Whereas the public health sector contribution was more in 1995–1997, the private health sector contribution far outweighs the former in the present reference period.

There are no screening programs for any region in Pakistan; however, there are facilities for PSA testing, PAP smears and mammography.

It is not possible to precisely estimate how many cancer cases remain undiagnosed, as there are no autopsies and the death registration system is very inadequate and incomplete. The registry however annually conducts a formal evaluation of the completeness or accuracy by utilizing the well-maintained and documented cancer data at Zainab Punjwani Medical Centre and the Baqai Institute of Oncology.

The district has a preponderance of self-inflicted (tobacco, arecanut, paan misuse) malignancies in men and breast cancer in women. These outweigh any occupational exposures if present, there being oil refineries and tanneries in this district. Karachi South is a belt fringing the Arabian Sea. Potential environmental hazards could be oil spillage and un-detoxified chemical products discharged into the sea by tanneries and other factories.

Use of the data

The incidence data are reported regularly to the Federal Government and various agencies in Pakistan requiring the same

for health sector planning and monitoring. The data are used for case–control studies, for research theses and dissertations of post-graduate students and fellows. The NCCP Pakistan planning, implementation and monitoring is based on this data.

Source of population
Census 1998. 1999–2002 estimated using 1.94% growth rate from Census 1998.

Multiple primary rules used
IACR rules (2004) on historical data

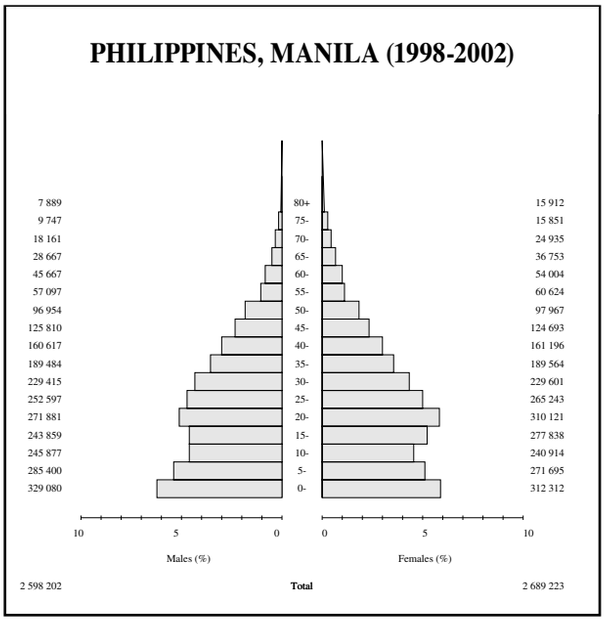
Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Philippines, Manila

Registration area

The registry covers the four major cities (Manila, Quezon, Pasay, Caloocan) of the National Capital Region (NCR), the major urban centre of the country. It encompasses a land area of 274.2 km^2 located in the southwest portion of Luzon between latitudes 14°48′23″ and 14°31′15″ N and longitudes 14°39′53″ and 121°05′20″ W. Manila is the capital and main port of the Philippines, the hub of commerce and trade and the seat of cultural and intellectual activities.

The population covered by the registry, based on the 2000 census of Population and Housing, is 5 287 425, a 4.1% increase over 1995. As a whole, the population is young, with 31.87% under 15 years of age and only 2.10% over 65. It comprises 140 different ethnic groups, the largest of which are Tagalog (69.85%), Bicol (4.27%), Ilocano (4.16%), Bisaya (3.87%) and Waray (2.81%). Among the foreign ethnic groups the largest are Chinese (0.59%), Other Foreign (0.04%) and American/English (0.02%). Most (88.8%) are Roman Catholic, 3.2% Iglesia ni Kristo and 0.6 % Muslim.



Cancer care facilities

Health services in the National Capital Region and the adjacent province of Rizal include four cancer institutes, 168 secondary and tertiary care hospitals, 43 primary care hospitals and 32 Department of Health clinics for out-patient consultations. Ten hospitals have radiotherapy facilities.

Registry structure and methods

The Philippine Cancer Society (PCS) began cancer registration in 1959 in an attempt to organise a national cancer registry. Although this was not successful, it served as a pilot study. In 1968, the Central Tumor Registry of the Philippines (CTRP) was launched, covering 25 hospitals in Manila and one in Cebu, completely relying on notifications from these hospitals. In 1983, it was converted to a population-based cancer registry and renamed the Philippine Cancer Society-Manila Cancer Registry. Cancer registry clerks were trained to abstract pertinent information from hospital records and death certificates and they actively collected data on cancer cases in its catchment area for the period 1980–82 onwards.

The registry is located in the PCS building, and is fully funded by the PCS. The registry staff comprises six part-time consultants, one full-time supervisor, and six cancer registry research assistants. In 1984, the registry started a cooperative effort with the Department of Health-Rizal Cancer Registry in covering 134 hospitals within the National Capital Region and Rizal Province. Both registries use the same active data collection methods.

Hospital data sources include medical records, radiotherapy records, pathology/haematology records and logs, radiology, ultrasound, nuclear medicine, CT/MRI reports and logs, and hospital tumour registries. Death certificates from the office of the Local Civil Registries are also reviewed. The registry staff also visits selected private surgeons, oncologists and hematologists.

Data received are checked manually and electronically for completeness and consistency as well as for duplication. Coding consistency and validity is checked with the IARC/IACR CanReg-4 software. Follow–up was done previously through death certificate review. In 1997, however, PCS-MCR conducted its first population-based survival study on the 1987 incident cancer cases, using both active and passive follow-up. Although regular formal evaluation of data completeness or accuracy is ideal, limitation in funding still restricts this activity.

Interpreting the results

Some challenges faced by the registry include inadequate manpower for data collection and other registry procedures; poor record-keeping in some hospitals; non-inclusion of private pathologists' reports in some hospital records; use of different names (particularly among Chinese); and delayed data collection due to confidentiality concerns in some hospitals.

The increase in availability of diagnostic and treatment facilities has not necessarily increased their utilisation because of economic and educational factors; PSA testing is not common, and there are no organised screening programmes for any cancer site. There were no unusual environmental or occupational exposures which could have influenced cancer incidence in the population.

Those changes in case definition and coding initiated by IARC are the only ones used by the registry. High percentages of DCO registrations in 1993–1997 led to more thorough trace-back of DCN cases in the hospitals and patient residences, particularly for liver cases (50% at the time). In spite of these problems, the staff continues its efforts at improving completeness as well as data accuracy.

Use of the data

The registry prepares reports on cancer incidence as well as trends. Data generated from the Manila and Rizal registries have served as a basis for planning of most of the cancer control activities of the Philippine Cancer Control Program of the Department of Health. They have been used for epidemiological research, as well as for public information activities of the media and NGO's. There is an ongoing collaboration with the German Cancer Research Center regarding recent trends, up-to-date estimates and determinants of cancer survival on 10 leading sites among 1993–2002 incident cases.

Source of population
Census 2000. Gathering of population and housing data was performed by census enumerators through house–house visits and interview of a responsible member of each household. The household was the enumeration unit.

Multiple primary rules used
IACR rules (2004) on historical data

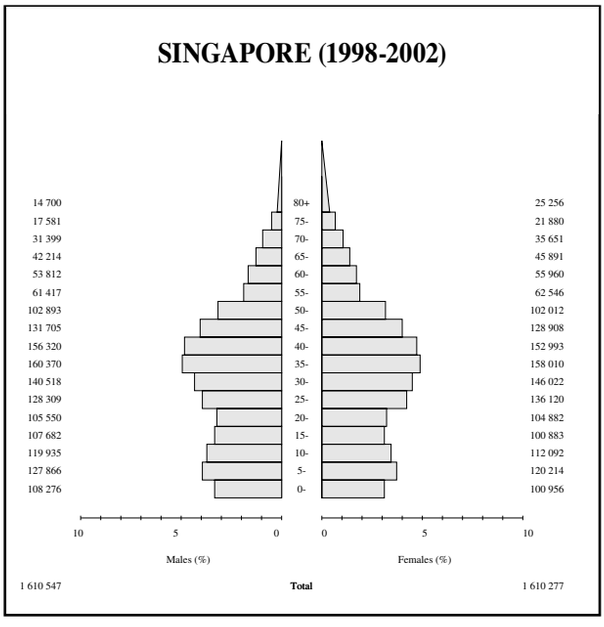
Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Singapore

Registration area

The registry covers the whole of the Republic of Singapore, situated in Southeast Asia, and comprises the main island of Singapore and several offshore islands which jointly cover an area of 682.7 km^2. The main island measures 42 km from east to west and 23 km from north to south, and is situated on latitude 1°17'N and longitude 103°15'E, at the southern tip of the Malayan Peninsula. The island is rather flat, the highest point being a central granite hill 166 metres high. The maximum temperature is around 31°C and the minimum 24°C. The mean relative humidity is around 84%. The island generally has rainfall throughout the year (total annual rainfall approximately 2344mm), but is particularly wet during the monsoon season from November to January.

The resident population (3 263 209 in 2000) comprises several ethnic groups, the largest of which are Chinese (76.8%), Malays (13.9%) and Indians (7.9%). Overall, the population density (2000 Census) is 4780 persons per km^2.



Cancer care facilities

In 2000, there were 5395 registered medical practitioners (one medical practitioner to 745 people), of whom 2779 were in private practice and 2616 in the public sector. A total of 11 798 hospital beds (2.9 hospital beds per 1000 population) were available: 9556 in 13 public hospitals and 2242 in 13 private hospitals. There were also 16 public outpatient Polyclinics, which together with private clinics offer primary health care. Diagnostic and treatment services including radiotherapy are available in the public and private hospitals.

Registry structure and methods

Comprehensive population-based cancer registration began in January 1968. The Registry was founded primarily to obtain information on cancer patterns and trends in Singapore. Until March 2001, the Registry was staffed by one pathologist and three epidemiologists (part- time), and three secretaries and one record searcher (full-time). In April 2001, the Registry came under the auspices of the National Disease Registries Office and is currently situated at the Health Promotion Board with two additional full-time staff. There is a Steering Committee comprising representatives of the Ministry of Health and various hospitals.

Sources of data are: (a) cancer notifications from all sections of the medical profession, (b) pathology records, (c) hospital records and (d) death certificates. Cancer notification is voluntary. All doctors in Singapore are provided with notification forms with prepaid postage. The Registry ensures that notifications are as complete as possible by checking all pathology reports from public and private laboratories, and death certificates issued in Singapore as well as records of all public hospitals. Cancer cases identified from these sources are checked against registered cases, and reminders are sent to doctors in charge of cases that have not been notified to the Registry. Cancer cases not notified by doctors (approximately 10%) are registered by the Registry staff on the basis of information derived from the sources mentioned above. Cancer registration is generally comprehensive since all cases diagnosed histologically and all cases with mention of cancer in hospital discharge forms and death certificates are included.

There is no personal contact with cases or patient follow-up by the Registry. Information on diagnosis and survival is obtained through hospital, pathology and death records.

The cancer notification forms and a register of cases are maintained on a current chronological basis. All relevant information is coded, and the Registry maintains a computerised file of all cases. Duplication of cases is avoided by checking all new cases against the master index.

Certification of death is virtually complete in Singapore. In 2000, 97.6% of all deaths were certified by qualified medical practitioners or the Coroner and 2.4% by Inspecting Officers. The latter would certify a case as cancer only on the basis of a previous hospital diagnosis.

Evaluation of completeness or accuracy of information recorded will be carried out at the end of a 5-year period before publishing the Singapore Cancer Registry 5-year monograph.

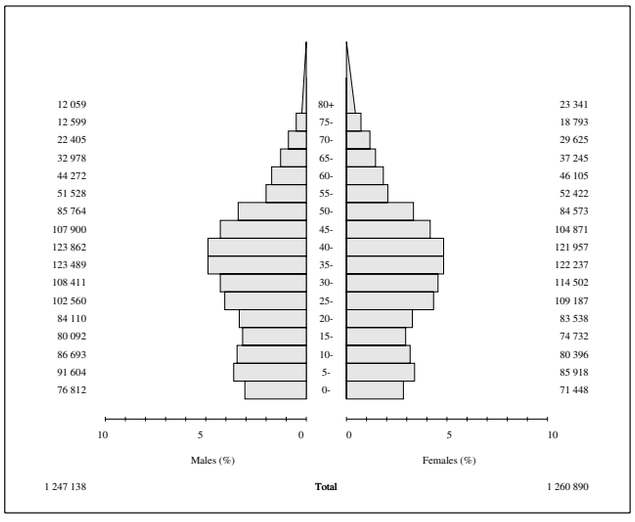
Interpreting the results

Although the population covered by the registry has increased (the growth rate for resident population was 1.8% in 2000), it is unlikely that cancer cases will be missed as the public and private hospitals in Singapore have the full range of diagnostic and treatment facilities and the population-to-doctor ratio continued to improve. Opportunistic cancer screening services were offered by hospitals and clinics in the public and private sectors.

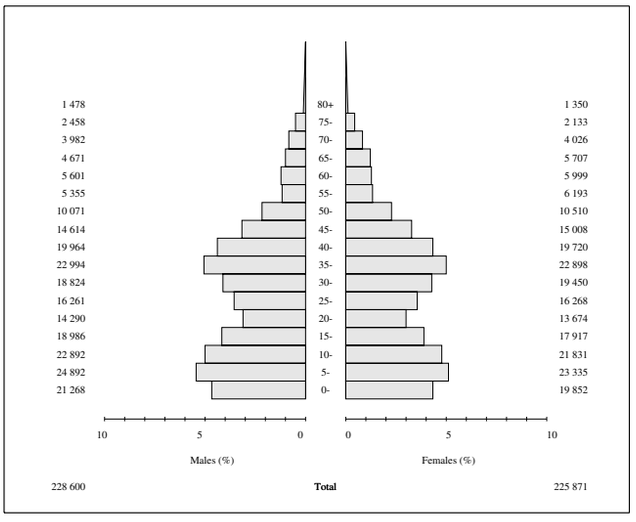
Use of the data

The data have been used mainly to determine incidence levels and relative risks of cancers in Singapore by sex, ethnic groups and migrant status. Such information has formed the basis of epidemiological and clinical studies on specific cancers. The Ministry of Health Singapore and hospitals administrators use the data for planning and evaluation.

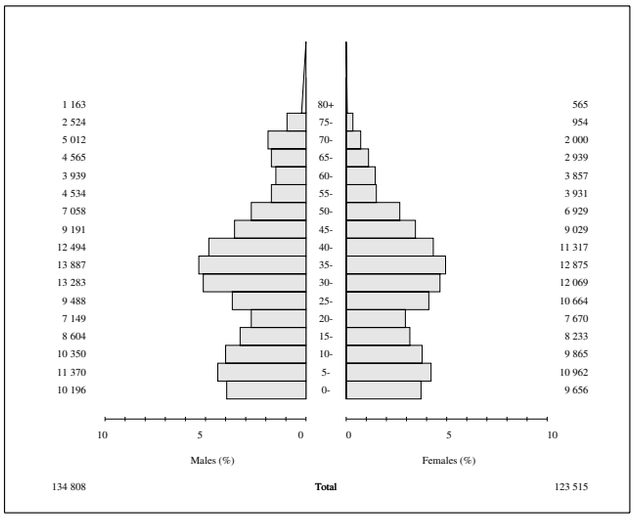
SINGAPORE: CHINESE (1998-2002)



SINGAPORE: MALAY (1998-2002)



SINGAPORE: INDIAN (1998-2002)



Source of population
Estimates based on the 1990 and 2000 census data.

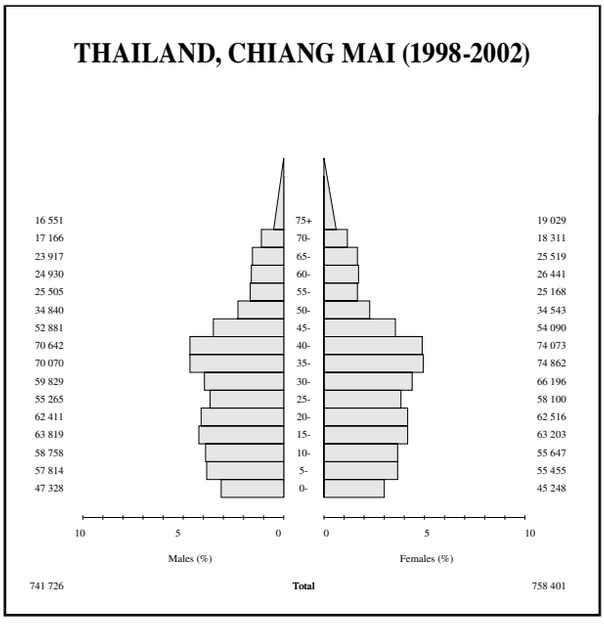
Multiple primary rules used
IACR rules (1990)

Thailand, Chiang Mai

Registration area
Chiang Mai Cancer Registry covers the population of Chiang Mai province. The population of the province at the 2000 census was 1 500 127 persons. There were approximately 430 154 families, and the population density averaged 79.1 people per km^2. In the municipal area, this figure increased to 4789.9 per km^2. Only 26.5% of the total population was living in the municipal area.

Eighty-two percent of the population was local by birth, and the remainder was made up of Thai nationals, Chinese, Laos, and hill tribe people. Buddhism was the professed religion of 91.7% of the people in the province. For the remainder, most were either Christians or Muslims.

Cancer care facilities
The Chiang Mai Provincial Public Health Office, through the provincial hospitals and district hospitals, predominantly provides general health care in Chiang Mai province. Cancer diagnostic services (clinical consultations, radiological and pathological investigations) are available at most public and private hospitals in the province. However, diagnostic and cancer-related therapeutic facilities are available within the same institution only at the University Hospital (Maharaj Nakorn Chiang Mai Hospital). Cancer surgery services are provided at several locations; the university hospital, five government hospitals, two community hospitals and eight private hospitals. Cancer chemotherapy services are provided at the university hospital, two government and six private hospitals. Radiotherapy equipment is available at the university hospital. Most patients at primary and secondary care facilities suspected of having cancer are referred to Maharaj Nakorn Chiang Mai Hospital.



Registry structure and methods
The registry is located within The Maharaj Nakorn Chiang Mai Hospital, and is fully supported by the Faculty of Medicine of Chiang Mai University. The registry is staffed by 3 part-time physicians, 4 full-time registrar nurses, and 3 practical nurses, and is supervised by members of the Hospital Cancer Committee.

Data on patients diagnosed with cancer are collected actively from the university hospital (Maharaj Nakorn Chiang Mai Hospital, 1800 beds), 11 government hospitals (2200 beds), 17 community hospitals (620 beds), 13 private hospitals (1500 beds) and medical clinics, under the care of 900 physicians, with the total of about 6185 beds in Chiang Mai province.

The principal sources of information on cancer cases are hospital and pathology laboratory records.

Death certificates were taken from the Unit of Data Processing, 5th Region of Ministry of Interior. All death certificates that mention cancer as the cause of death are matched against the registered cases. Every cancer death not traceable to an existing entry is labelled as "death certificate only".

The registry staff visits all sources and registers of individual departments concerned with diagnosis and treatment of cancers, to identify and abstract information on cases of cancer into the tumour registration forms. Although cancer is not a notifiable disease, the hospitals in the registration area cooperate with the registry.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but this probably occurs for subjects in rural areas. Maharaj Nakorn Chiang Mai Hospital is the only university hospital in the area and has a full range of diagnostic facilities, so that it is unlikely that cases referred will be missed. The diagnostic facilities are increased by image studies (CT scan and MRI) and especially by cytology (fine needle aspiration biopsy) and histology.

There is only one screening program for cancer of cervix, and there are sporadic health education campaigns about common cancers in the region. PSA testing is commonly used in the Maharaj Nakorn Chiang Mai Hospital.

Coding was changed from ICD-0-2 to ICD-0-3 as of the cases registered in 2000. Plans are underway to use the IT system of the hospitals in Chiang Mai to evaluate the completeness and accuracy of data.

Use of the data
The registry has reported annually on cancer occurrence since the first volume in 1978, when it was a hospital-based registry. Population-based registration was started in 1986 to report the incidence and mortality of cancer in Chiang Mai province since 1983.

The registry has also joined with the other registries in Thailand to report on national cancer incidence every 3–5 years.

The registry is involved in epidemiological research of common cancer in Chiang Mai.

Chiang Mai Cancer Registry data are used together with other Cancer Registries to inform the Ministry of Public Health.

Source of population
Census 2000, the 2000 Population and Housing Census, Chiang Mai province, National Statistical Office, Office of the Prime Minister.

Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

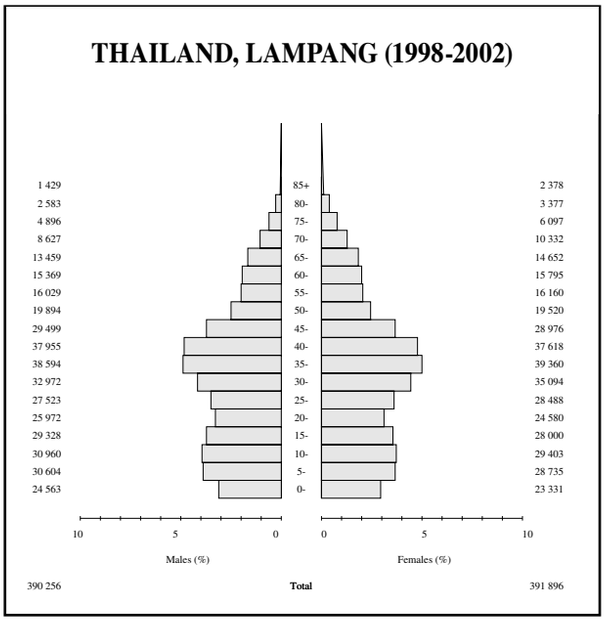
Thailand, Lampang

Registration data
Lampang is one of the 17 provinces located in the northern part in Thailand, between 17°-19°N and 98°-100°E, 269 m above sea level, 602 km by car from Bangkok (625 km by train) with a land area of 12 534 km^2. It has common boundary with Chiang Mai in the north and the west. This registry covers the population of 13 districts.

The total population in 2000 (housing census by National Statistical Office, office of the Prime Minister) was 782 152, with 390 256 males and 391 896 females at a population density of 62 people per km^2. About 30% of the population live in urban areas; 97% are Buddhists, the remainder mainly Christians.

The climate is generally cooler than the rest of the country in winter from November to February, and hot and dry during March to May in summer. The average total rainfall is 974.5 mm per year.

Most people are farmers, working in rice and tobacco. There are many porcelain production and very large open cast-mines (with national coal-fired electricity-generating plants close by).



Cancer care facilities
General health care in the region is provided in all 13 districts. In the urban area (Muang district), there is one cancer centre (Lampang Cancer Center), two private hospitals and one military hospital. Cancer diagnostic services including CT scan (clinical consultations and radiological/pathological investigations), cancer surgery services and chemotherapy are available in Lampang Cancer Center and Lampang provincial hospital. Radiation therapy equipment (one simulator, two cobalt-60 machines, one linear accelerator and two remotes after-loading for brachytherapy) is provided at Lampang Cancer Center. All hospitals in the province provide palliative care.

Patients suspected to have cancer in the primary and secondary health care centres in the registry area are mostly referred to Lampang Cancer Center and Lampang provincial hospital.

Registry structure and methods
The registry is located within Lampang Cancer Center, which also provides equipment, and is funded by cancer research foundation for National Cancer Institute. A part-time expert consultant, a part-time doctor, a part-time nurse and two full-time health workers staff the registry.

The Lampang registry was established in 1995 with the backup data of a population-based cancer registry in Lampang dating from 1983 which was collected by Dr.Nimit Martin, our expert consultant. The registration uses passive methods by notification from 21 sources of data consisting of cancer centres, general hospitals, community hospitals, private hospitals, university hospital, the provincial public health service of Lampang and pathological laboratories.

New cancer cases from all hospitals are collected from out- and inpatient departments, wards, radiotherapy units, surgery units and pathology services. Data collection consists of: registry number, name, residential address, date of birth, age, sex, date of diagnosis, site of cancer, histology of cancer, staging, extension of disease, method of diagnosis, treatment, date of last contact and status of cancer patients (alive or dead).

We carried out follow-up of registered cases by matching of cases with all death certificates. Death certificates mentioning cancer death without other information about the individual traceable from other sources are registered as Death Certificate Only (DCO).

We have used histologically verified percentage (%HV), Mortality Incidence ratio (MI Ratio) and percent of DCO (%DCO) for evaluation of our completeness since our first report on 2002.

Interpreting the results
Cancer cases are collected from all hospitals in Lampang. However, there were some patients referred to Chiang Mai University Hospital and the National Cancer Institute in Bangkok. We therefore collected these cases in our registry as well. We also have back up data since 1983. Due to these reasons, we believe that cases might not be missed or repeated. Data are entered using the IARC/IACR CanReg software.

A cervical cancer screening programme (Pap smear every 5 years) has been supported by Ministry of Public Health since 1999. The target population is women aged 35–64 years old. Pap smear is available in all hospitals in Lampang and easily accessible.

PSA testing is available only at provincial hospitals, university hospitals, cancer centres and some private hospitals, and is not routinely included in yearly checkup programmes, except in cancer centres.

Use of the data
The registry provides periodic reports on cancer incidence, mortality and survival in Lampang. The data are also sent to the National Cancer Institute to help compile the report *Cancer in Thailand*. The data are also used by the local health authority for the evaluation of public health measures in the prevention, screening and treatment of cancer.

Source of population
Census 2000, Lampang Provincial Statistical Office.

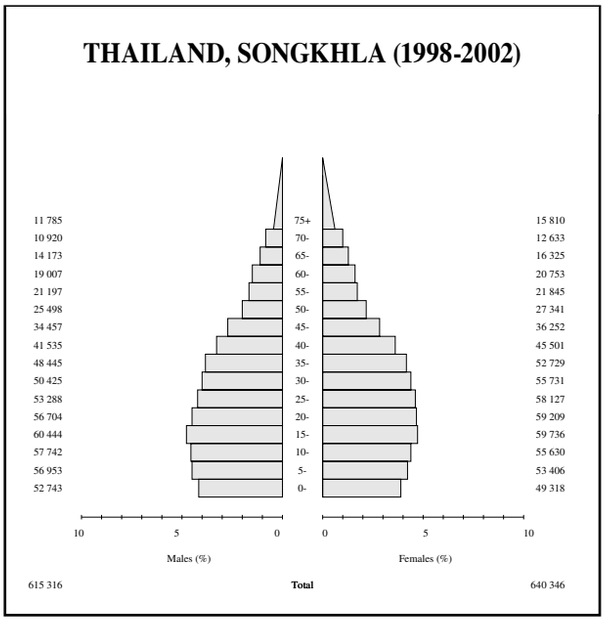
Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Thailand, Songkhla

Registration area
The Songkhla Registry covers the population of 16 districts in the south of Thailand. The population at the 2000 census was 1 255 662. About 80% of the population is Buddhist, and nearly 20% are Moslems. Christians and others account for less than 1% of the population. People with Chinese ancestry live in Songkhla town and Hat Yai city, which is the economic centre of the south of Thailand.

Cancer care facilities
The government of Thailand predominantly provides general health care in the region. There are three hospitals with over 500 beds, 13 community hospitals and an extensive network of healthcare facilities at the household level. Private practitioners, a few private hospitals, and a few small special hospitals, all in the urban area, supplement this. The university hospital of Prince of Songkla University is the larger of the two places in the south of Thailand providing radiotherapy services. A few other large hospitals also have facilities for cancer surgery and chemotherapy. Patients suspected to have cancer in the health care system and community hospitals are referred to Songkhla, Hat Yai or Songklanagarind hospitals.



Registry structure and methods
The registry is located within the Faculty of Medicine, Prince of Songkla University. Three part-time medical doctors, a full-time nurse as a registrar and four full-time workers staff the registry.

The Songkhla registry undertakes active casefinding from 23 sources of data, consisting of Songklanagarind hospital, Hat Yai hospital, Songkhla hospital, community hospitals, private hospitals, special hospitals, provincial health office, and the population registration office of the province.

The completeness of death registration is acceptable but the cause of death is not so accurate, being mostly cardiopulmonary arrest and senility. After the national heath care reform started in 2000, the validity of the death certificates has been improving.

The registry staff also runs the hospital-based registry of the Songklanagarind hospital, and the data are shared with the registry of Songkhla. Hat Yai hospital has its own system of cancer case reporting but not a full-scale hospital-based cancer registry, and provides the cases residing in Songkhla to the registry. The registry staff visits Hat Yai, Songkhla, and private hospitals to consult medical records and pathology records.

Assigned staff in community hospitals send the record forms of cancer cases to the registry once a year. Registry staff regularly visit them to reviews procedures. Some cases are sent to the registry by the network of cancer registries in Thailand, especially the registry of Bangkok.

Interpreting the results
The number of undiagnosed and unregistered cancer cases is difficult to estimate. Some Moslems in a remote area in the south of Songkhla visit large hospitals in the two nearby provinces, and some residents, especially the elderly, use traditional herbal medicines and never enter the country's healthcare system. Because of the linkage between the referral system and the new national health assurance system, it is expected that only a small number of cancer patients in that remote area seek medical facilities outside the province. A few other cases look for special medical care in Bangkok, the capital of Thailand.

There were no screening programmes over the period in question, and PSA testing is not common.

A very recent study of ours demonstrates a relationship between radium-contaminated shallow well water and oral pharynx and oesophageal cancer.

Use of the data
The registry is preparing a fifteen-year report providing information on cancer incidence and trends in Songkhla. It provides data for causation studies, especially in the field of oral and esophageal cancer, which is the main burden in this area. Extent of disease and survival are reported in *Cancer in Thailand vol. IV.*

The Thai Network of Cancer Registries (TNCR) was recently founded. The Thai NCI and TNCR work together to supply policymakers, academic bodies and public organisations recent accurate cancer statistics, projections, and ideas for cancer control for Thailand. We plan to undertake this collaboration as a non-governmental academic body to have more power and a louder voice.

Source of population
Census 2000, National Statistical Office.

Multiple primary rules used
IACR rules (1990).

Turkey, Antalya

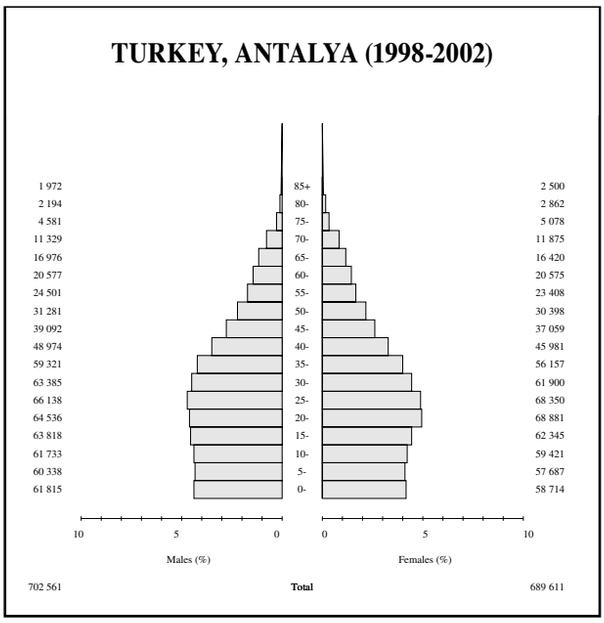
Registration area
Antalya is a city located in the southern part of Turkey's Mediterranean region. The province of Antalya is located between the 36°07"N latitude and 29°20"E longitude. The population of Antalya according to health statistics is 1 392 172 (2000); 74% of the population lives in urban areas. The region of the most of people is Islam. Antalya has had the fastest population growth in Turkey in recent years because of internal immigration. Regional income comes from trade, agriculture (especially commercial growing of hothouse flowers, vegetables, or fruits), tourism and construction.

Cancer care facilities
General health care is predominantly provided by primary health centres and government hospitals, but in the last few years the number of private health centres has increased. Patients suspected to have cancer in the primary and secondary care facilities in the registry area are mostly referred to Mediterranean University hospital and government hospitals in the centre of Antalya.

Registry structure and methods
The registry centre is staffed by a full-time public health specialist (MD), and full-time health workers. Additionally there are 17 cancer registry staff in the hospital; the six staff members who work in the government and university hospital in the centre of Antalya are full-time, other registry staff are part-time.

The Antalya Cancer Registry collects data on all new cases of cancer from all hospitals and some clinics that provide all diagnostic and treatment services for cancer in the province. In 1998–2002, Antalya registry used active case finding from 14 government hospitals, 2 university hospitals, 2 private radiotherapy clinics and 7 private pathology laboratories. The death registration system is incomplete, particularly in the rural areas, and the cause of death is often not mentioned or given as cardio-respiratory arrest. The registry staffs work government and university hospitals, where they scrutinise the records kept in medical records departments, and the registers of individual departments concerned with diagnosis of cancers, to identify and abstract information on cases of cancer, diagnosed by all methods. Additionally, private hospitals and other sources are visited monthly by registry personnel who take note of medical records of cancer patients.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but underdiagnosis probably occurs for elderly subjects in rural areas. An opportunistic screening service for cervical cancer has been operated by the cancer society since 2006.



Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. In 2006, the pathology laboratories of three hospitals in Antalya with access to county government hospital records were scrutinised and our data were examined for completeness and accuracy for 1998–2002. The statistical analysis of the information recorded is not yet complete.

Source of population
Annual registrations by primary health center of the Provincial Health Directorate of Antalya in 2000.

Multiple primary rules used
IACR rules (1990)

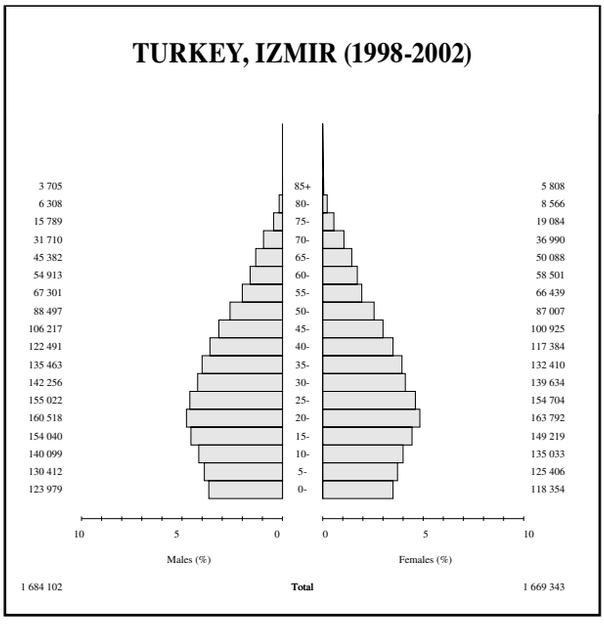
Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Turkey, Izmir

Registration area
The Izmir Cancer Registry covers the population of the province of Izmir, which is divided into 28 administrative districts. İzmir province is in the extreme west of the country, on the Aegean Sea coast. The population is 3.37 million (mid 2000), making it the third-largest province in Turkey; 81% of the population lives in urban areas, with the remaining 19% in rural areas. Most of the people are Islamic. Izmir is one of the most developed and westernised parts of the country.

Cancer care facilities
The registry is a subdivision of the Provincial Health Directorate of Izmir and is mainly funded by the state. ICR is also financially supported by the MECC (Middle East Cancer Consortium).

General healthcare in the region is provided predominantly by the Turkish state health services department, through the two university hospitals, state hospitals and a network of primary health centres. This is supplemented by private physicians and private hospitals. While major hospitals provide radiotherapy and chemotherapy services, cancer diagnosis and cancer surgery procedures are available in most health facilities. Also, there are five private oncology centres that provide radiotherapy and chemotherapy facilities. With its developed health services, Izmir is a referral centre for patients from other provinces, especially the provinces of the Aegean Region. It is possible that some Izmir residents with cancer choose to be treated elsewhere, such as Istanbul or Europe. However, this is unlikely to be more than 1% of the cancer patients, bearing in mind the social composition of the population.



Registry structure and methods
The Izmir Cancer Registry (ICR) collects data on all new cases of cancer from all of the facilities in the province, including university hospitals, state hospitals, teaching hospitals, municipality hospitals, other governmental hospitals, private hospitals, private cancer centres (n=25) and pathology laboratories (n=23). Nine hospitals have hospital-based cancer registries, from which the ICR receives the data directly. The staffs of these hospital registries apply the same rules with ICR while collecting, abstracting and coding the data and are supervised by ICR. For all other sources, data collection is active at the time of visits by full-time, medically qualified registrars. Internal consistency checks are continuously done for all cases and for whole database, in addition to this, re-coding of selected cases (10% by random selection) for each series are performed systematically.

Similar to Turkey in general, mortality data in Izmir are incomplete, and notified only for urban areas, with a problem of accuracy in regard to underlying cause of death. Although ICR collects data of death certificates referred to cancer obtained from Provincial Health Directorate records, these certificates are poor in quality and lack information even for socio-demographic data and addresses. Matching these data with ICR database is quite difficult. Despite all these realities, ICR began in 2005 to routinely match the death certificates with the records of incident cases and process them.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but underdiagnosis probably occurs for older adults in rural areas. While awareness of the public has been increasing in the last 5–10 years, cancer diagnosis at health facilities in the region has improved consistently. Opportunistic screenings for breast, prostate, cervical and colorectal cancers are quite widely performed. Systematic screening for breast cancer has been applied for a small population, which covers approximately 2000 women aged 50–69. ICR collects data from all of these screenings.

Use of the data
The registry has published the results occasionally in scientific meetings and journals and at the website: http://www.ism.gov.tr/kidem.

Some special studies such as survival of registered cancer cases and some case–control (colorectal cancer) studies have been carried out.

Source of population
Annual registrations by primary health center of the Provincial Health Directorate of Izmir.

Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Austria

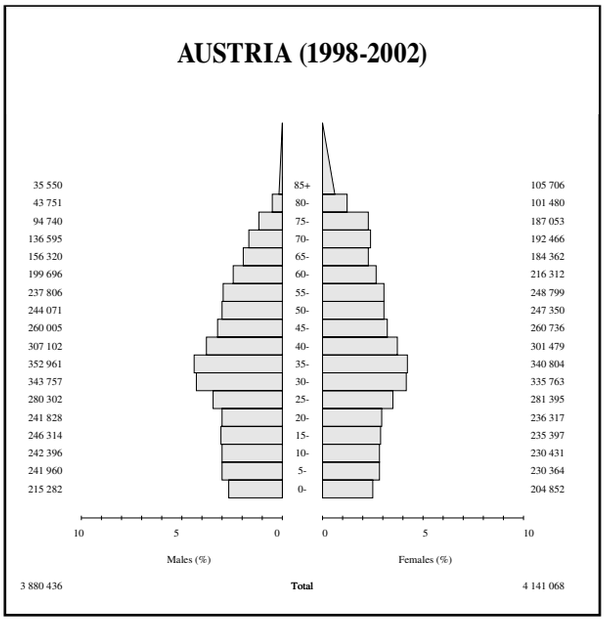
Registration area
The Austrian National Cancer Registry covers the whole population of Austria, approximately 8.3 million (2007) inhabitants. About 90% of the Austrian population are Austrian citizens; other nationalities and/or ethnic groups include Turks, Serbs, Germans and Croatians. Approximately 15% of the population are foreign-born. More than 80% of the population are Catholic, and about 5% are Protestant. Another 5% are part of Islamic, Israelite and other Non-Catholic denominations.

Austria is divided into 9 provinces. The population is distributed as follows. Most of them reside in the provinces of Vienna (19.5%) and Lower Austria (19.2%), followed by Upper Austria (17.1%), Styria (14.7%), and Tyrol (8.4%). The lowest population can be found in Salzburg (6.4%), Carinthia (6.9%), Vorarlberg (4.4%) and Burgenland (3.4%).

The Austrian territory covers 83 871 km² of which 2/5 is permanently habitable. The country is characterised by a diversified geographical situation.



Cancer care facilities
A nationwide social security system covers 98% of the Austrian population. For inpatient treatment about 275 hospitals are available. More than two thirds of Austrian hospital beds are maintained by 133 public hospitals. Four of these hospitals are university hospitals, located in Vienna, Graz, Salzburg and Innsbruck. More than thirty hospitals run departments specialising in cancer treatment; many include a radiotherapy department.

Registry structure and methods
The Austrian National Cancer Registry is located in Vienna and is operated by Statistics Austria, the former "Österreichisches Statistisches Zentralamt". According to the Federal Statistics Act 2000 (Bundesstatistikgesetz 2000) the Austrian government appointed Statistics Austria as the national provider of various statistics. The government finances all statistics prescribed by this law (including cancer statistics). Altogether 13 people are directly involved in the cancer registry workflow. Some of them work part-time or are involved in other projects as well, which results in 9.4 FTE.

Preparatory work for the cancer statistics was done by the Austrian Cancer Society, which led to a legal basis for cancer registration in 1957 (Krankenanstaltengesetz). Since 1969 a more detailed law (Krebsstatistikgesetz) obliges hospitals to report every cancer case to Statistics Austria. Population-based data collection started only one year later. Hospitals fill in a form providing personal data, topography, histology and behaviour of the tumour as well as the incidence date. The stage of the tumour at diagnosis and the first treatment are also reported. Files are increasingly now transmitted electronically (via disk or secure FTP).

Four Austrian provinces run their own regional cancer registries. Information on every cancer case is collected in close cooperation with the main hospital of the respective area and is electronically processed. The information is forwarded to Statistics Austria on a regular basis.

All invasive and in-situ tumours are registered, and topography, morphology and behaviour are coded to ICD-O-3. The coding is done centrally in Vienna apart from the codes assigned by the Tyrolean Cancer Registry are accepted separately.

All incoming data are stored in a database that performs data checks at the point of data entry. These data checks are based on the IARC CHECK program, broadened at the national level. IARC/IACR rules for classifying multiple primaries are implemented as well. Multiple notifications for the same person are identified using the full name, date of birth, sex and address as well as social security number. For the quality control and assessment of completeness, electronic data of pathology laboratories and of various study groups are used.

The causes of death statistics are available electronically and are used for passive follow up and generating DCN cases. All death certificates mentioning cancer are available for the registry as paper forms as well, and are traced back when the patient died in a hospital.

Interpreting the results
For the whole of Austria opportunistic screening is carried out for cervix, breast and prostate. For some regions organised screening is carried out for prostate and large bowel. A regional comparability study of the data is currently underway.

Use of the data
The registry publishes data annually since 1970 in the yearbook on health statistics. Tables printed in this annual report show incidence rates broken down by primary site, stage, sex, age and region. In 2005 a publication contrasting incidence and mortality data was released. In 2006 the scope was further enlarged when it was published on the Internet. A special analysis of survival for colorectal cancer was published in 2006 as well.

Highly aggregated data are available for all interests. Medical Universities, the Gesundheit Österreich GmbH (GÖG), and cancer study groups are provided with data, which are at a lower aggregation level but still anonymous.

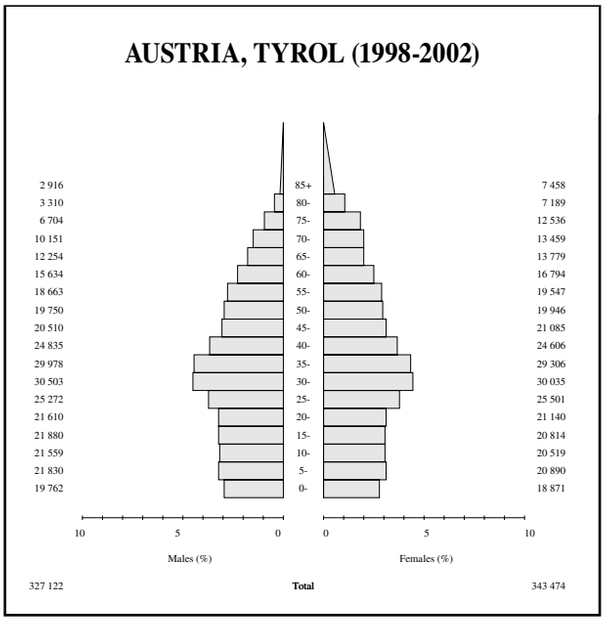
Source of population
The data are estimated by Statistics Austria, based on census data 2001 and data provided by the Central Population Registry.

Multiple primary rules used
IACR rules (2004) on historical data.

Austria, Tyrol

Registration area
Tyrol is one of nine provinces in Austria, and is situated in the west. The area covers 12 648 km^2; only some 12.5% is habitable. The average altitude of the habitable regions is about 740m. Nearly 20% of the population lives in one town with more than 100 000 inhabitants (the capital Innsbruck), the rest in smaller towns (less than 15 000) and in some 260 villages. Nine percent of the people are from foreign countries, mainly from the former Yugoslavia and Turkey. About 90% are Roman Catholics. The main occupational groups are personal services (32%), commerce and traffic (22%), industry and trade (22%) and tourism (10%), with some 6% unemployed.

Cancer care facilities
Medical facilities are provided by Innsbruck Medical University (offering both basic facilities for Innsbruck and special facilities for the whole province), nine local hospitals in the rural districts and two semi-private hospitals in Innsbruck. All diagnostic and therapeutic services for oncological patients are provided in the country. Most pathology diagnoses are done by one main institute in Innsbruck and five smaller pathology laboratories. Radiotherapy is offered by one Department of Radiotherapy at Innsbruck Medical University and by a radiotherapy unit within the Department of Gynaecology of Innsbruck Medical University. Chemotherapy is provided by all hospitals. For some cancer sites (leukaemias and lymphomas, head and neck cancer, ovarian cancers, and advanced melanomas) most patients are treated at Innsbruck Medical University. Treatment outside the country is rather rare. Tumour boards have been installed in the last years, but until now did not cover all cancer patients.



Registry structure and methods
The Cancer Registry of Tyrol commenced operations at the end of 1986, and has been population-based since 1988. Since 1969 there has been a law obliging hospitals to report every cancer case to the Austrian Federal Bureau of Statistics. In addition, local registries are responsible for cancer registration in some provinces.

The Cancer Registry of Tyrol is a department within and funded by the TILAK, an organisation managing the university hospital of Innsbruck and some smaller hospitals in the Tyrol. The registry is staffed by a part-time epidemiologist, a full time registrar and one part-time registrar, and data entry clerks as needed.

All hospitals are obliged to report cancer cases. Most departments fill in a form consisting of personal data, incidence date, most valid basis of diagnosis, topography, histology, behaviour, staging and summary of first treatment. All pathology diagnoses concerning cancer and all death certificates are sent to the registry.

Multiple cancers are recorded separately at the request of the physicians, but the IARC rules are used for reporting.

Follow up information is based on probabilistic record linkage between the incidence data and all-cause mortality data for the province of Tyrol. Coding is done by one trained person in cooperation with a pathologist.

Programs for checking personal data were developed within the registry. Lists generated are checked manually, and if there are queries the local communities are contacted. The cancer data are checked using IARC Tools. For formal evaluation of completeness, since 2003 we have applied the Bullard method using a program developed by the Thames Cancer Registry. Besides extensive plausibility checks, no formal evaluation of accuracy has been done to date.

Interpreting the results
The population in the province is stable, and there have not been changes in the structure of the medical services. The organisation of the registry has not changed in the last ten years. PSA tests were introduced in 1988/89 and since 1993 have been offered to all men aged 45–74 free of charge; more than 3/4 of all men in this age group had at least one PSA test in the last decade. There is also a spontaneous mammography programme which has had some influence on breast cancer rates. In addition, Pap smear tests and haemoccult tests are offered free of charge, and dermatologists organise early detection activities for melanomas every spring. We have no knowledge of unusual environmental or occupational exposures in Tyrol that could influence cancer incidence figures on the population level besides high radon exposure in a small village with a population of 2800.

Use of the data
Annual reports have been produced since 1988. Besides usual figures, the report also includes staging information, regional distribution and relative survival rates. Reports are distributed to key decision makers and are accessible online from our website. The data are widely used by physicians (especially from Innsbruck Medical University). Quality improvement programmes at the department level make use of survival rates. Survival data have been published within the EUROCARE study group.

Besides routine reports, the registry has been involved in a study of radon exposure and lung cancer. Main scientific work is concentrating on analysing time trends, mainly for prostate cancer and breast cancer.

Source of population
Official population data collected by Statistics Austria. In 2001, the population data were extracted from the census file; in the other years the population figures have been estimated in usual way.

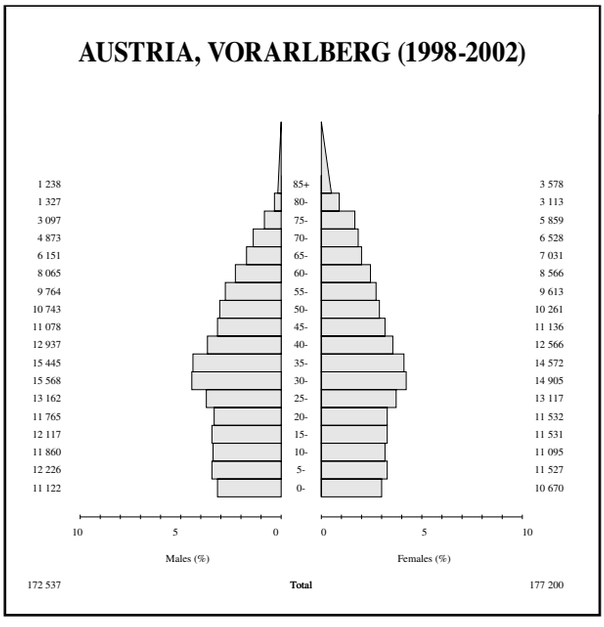
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Austria, Vorarlberg

Registration area

Vorarlberg is the westernmost of the nine federal states of Austria. It borders Switzerland, Germany, Liechtenstein and the Austrian federal state of Tyrol (19% of the border). Lake Constance comprises 8% of the border between Austria and Germany and Austria and Switzerland. Vorarlberg covers 2601 km², of which only 21% are habitable. 90% of the area is mountainous. Vorarlberg lies between 9° and 10°E and 46° and 47°N.

The total population of 351 570 (177 971 females, 173 599 males per census 2001) lives in 96 communities, five of which are cities; 51% live in communities with more than 10 000 inhabitants, 43% in communities with 1000 to 10 000 inhabitants and the others in smaller communities. The Rheintal (Rhine River valley) and Walgau are home to 81% of the population. The population density in the Rheintal (permanently settled area) is 1125/km², whereas the population density for the whole federal state (permanently settled area) is 620/km². Life expectancy at birth is 75.8 for males and 82.6 for females (2001). Inhabitants from foreign countries make up 14.5% of the population: 5.2% from Turkey, 4.6% former Yugoslavia, 2.8% from Germany, and 0.4% from Switzerland. 87.2% are Roman Catholics, 2.8% Protestants, 4.7% Muslims, 3.3% other denominations. The main occupational groups are: services (55.4%) and industry and trade (42.7%). The 2001 unemployment rate was 4.3%. See http://www.vorarlberg.at for further information.



Cancer care facilities

5 public hospitals and 2 private hospitals cover most medical needs. In special cases patients are sent to hospitals in other areas, mostly the university hospital in Innsbruck, Tyrol. Cancer treatment is provided by every hospital. There is only one Radio-Oncology department in the province, in Feldkirch. Hohenems hospital has recently opened a palliative care department.

Registry structure and methods

The Cancer Registry of Vorarlberg was founded in 1978 by the Pathology Department at Feldkirch hospital. Electronic data processing was introduced in 1981.

In 1968 a cancer registration law was passed in Austria, obliging hospitals to report every cancer case to the Federal Bureau of Statistics. In addition to this federal registry, local cancer registries exist in some federal states. In Vorarlberg the cancer registry is part of the "Arbeitskreis für Vorsorge und Sozialmedizin (aks)", a non-profit organisation founded in 1964, working on behalf of the local government in the field of health promotion, preventive medicine and social medicine. Per Vorarlberg government decree, hospitals are required to send their records to the local cancer registry, from where they are forwarded to the Federal Bureau of Statistics. The main source of the data is the Institute of Pathology (histological, cytological and necropsy diagnoses). The data are transferred to the cancer registry and compared to data already registered. From there a registration sheet (including the pathology diagnosis) is sent to the hospital for further information. In cases with no pathology diagnosis the hospitals report the cases directly. The radiooncology department, which tracks each patient, also sends data to the registry. In general, multiple notifications are received for one cancer phase. Persons are identified by name, date of birth, sex, address and (since 1995) social security number. A sophisticated program developed by the Cancer Registry of Tyrol establishes links between various records. Multiple cancers for a person are recorded separately. Follow-up is confined to date of death.

Topography and histology are classified according to ICD-O-DA (German edition). Coding is done by a trained person in cooperation with a pathologist and medical doctor. The first quality inspection is performed by the medical manager before data is entered. In addition, IARC check programs and plausibility checks established by the Cancer Registry are applied periodically.

The only pathology institute in our region provides the first information on cancer at primary histological diagnosis and on autopsy reports. Clinicians from the clinical departments supplement the remaining data. Aks staff merge the data into the cancer registry. Completeness is examined by comparison with all hospitals' discharge diagnoses. We organise team sessions on a regular basis with participation from responsible persons from the aks.

Interpreting the results

The population in the province is stable and there have been no changes in the medical services structure or in availability of diagnostic or treatment services. Case definitions and coding did not change in 1998–2002. Well-organised preventive care and early detection programs have been available in Vorarlberg for many years. In 1998–2000, 37% of women and 32% of men took part in health checks (including hemocult tests) and 45% in gynaecological exams (including Pap smear). Mammography screening has been active since 1989.

Use of the data

Annual reports are made to the government health department. The data are used for evaluating local cancer

screening programs, such as early breast cancer detection, cervical cytology and colon adenoma. In Vorarlberg, health checks (*Gesundenuntersuchungen*) are very common, so the cancer registry also documents dysplasia and adenoma of the colon as cancer risks. Incidence data for the Cancer Registry of Vorarlberg between diagnosis years 1996–2000 have appeared in a publication entitled *Cancer Mapping in Alpine Regions 1996-2000: Trentino, South Tyrol, Carinthia, Tyrol, Vorarlberg*. Data are linked and used for publications and scientific reports known as the Vorarlberg Health Monitoring and Promotion Programm (VHM&PP). For further information see: http://www.aks.or.at and search "Health Monitoring & Promotion".

Source of population
The data are estimated by the Institute of Statistics in the Government of Vorarlberg, based on census data from 2001.

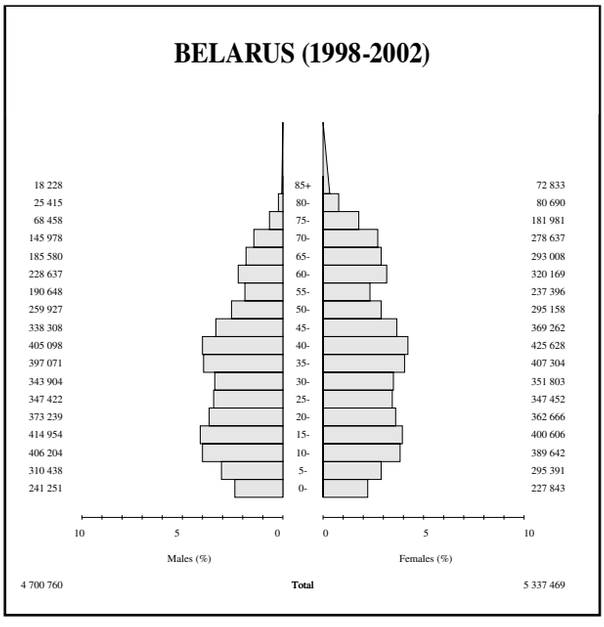
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Belarus

Registration area
The Belarussian Cancer Registry covers the population of Belarus, which occupies 207 600 km^2. The population in 1999 was 10 179 121 (males 46.6%, females 53.4%, urban 70.3%).

Cancer care facilities
The main treatment facilities are the 12 oncological dispensaries, which combine outpatient and inpatient clinics, and an Institute for Oncology and Medical Radiology.

Registry structure and methods
Cancer registration is mandatory and has been carried out according to the directive of the Ministry of Public Health of the USSR since 1953. However, until the beginning of the 1970s, it was performed on the basis of obligatory official statistical reports, and there was no computer database with individual information on cancer cases.



The Belarussian Cancer Registry includes complete individual information on cancer cases since 1978, but for the period 1978–1985 there are no personal identifiers such as name and address. In 1985–1988 a computer system was gradually set up in the oncological dispensaries, which allowed long-term continuous data collection for each patient and easier follow-up. Since 1991 this system has functioned on personal computers in all the Belarussian oncological dispensaries and the Institute for Oncology and Medical Radiology. Since 1999 new computer system was introduced based on ICD-10 and ICD-O-2 morphological classification.

The Belarussian cancer registry has been located in the Belarussian Centre for Medical Technologies, Computer Systems, Administration, and Economics of Public Health in Minsk since 1992.

In Belarus, the majority (about 80–85%) of cancer patients are diagnosed and treated in the oncological dispensaries and the Institute for Oncology and Medical Radiology, which is responsible for the registration of cancer cases for Minsk oblast (region). This makes data collection significantly easier. The 12 oncological dispensaries and the Institute for Oncology and Medical Radiology are responsible for registration of all cancer patients permanently residing in their service area, and regional sub-registries of the Belarussian Cancer Registry are maintained in the oncological dispensaries and the Institute for Oncology and Medical Radiology.

Most information is entered onto computers directly from patients' medical records (outpatient medical card and history of disease) stored in the dispensaries and the Institute for Oncology and Medical Radiology. Extracts of medical documents and special notification forms are also obtained from the Institute for Oncology and Medical Radiology, the Children's Oncological and Haematological Centre, Centre for Thyroid Tumours Pathology, Institute for Neurology, haematological hospitals, hospitals with cancer beds, and out-patient clinics, where cancer is diagnosed and treated. Pathologists must also complete and send a notification if they incidentally diagnose cancer as a result of an autopsy.

Death certificates are checked monthly by the personnel of the oncological dispensaries and the Institute for Oncology and Medical Radiology in regional state statistics departments for any mention of cancer. Information found is checked against the database in the dispensary. For each cancer case not found in the database additional information is requested from the institution, which issued the certificate.

In-situ cancers are registered but are not included in the cancer statistics.

Primary multiple tumours are registered as separate cancer cases if they appear (simultaneously or at a later time) in different organs or different parts of the same organ (including skin); each tumour is entered into the database separately according to the 4-digit ICD-9 code. The records have the same unique key and may be analysed together if desired.

Interpreting the results
In 1986 the Chernobyl accident resulted in radiation exposure to about 20% of the Belarussian population. After 1991, a high increase in the number of thyroid cancers in children, related to I^{131} irradiation of the thyroid gland, was observed.

Use of the data
The Belarussian Cancer Registry submits official statistical reports to the Ministry of Health annually, including data on cancer incidence, mortality and treatment in Belarus, as well as the statistical collection *Malignant Neoplasms in Belarus for a Decade*, highlighting trends and changes.

Source of population
Annual populations are estimates, calculated by the State Statistical Department on the basis of the 1999 census, making allowance for births and deaths, and migration into and out of the registration area. Migration data are annually provided by the Ministry of Internal Affairs to the State Statistical Department.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

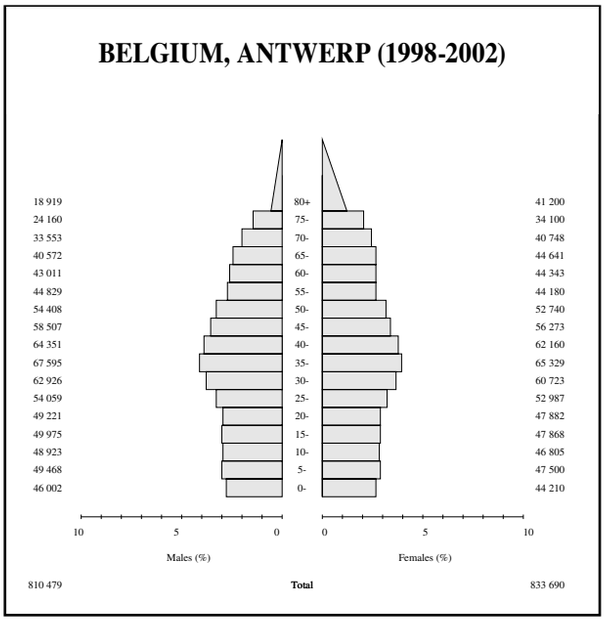
Belgium, Antwerp

Registration area
The Antwerp Cancer Registry covers the province of Antwerp in the north-west of Belgium. Almost half of its population of 1.6 million inhabitants is concentrated in and around the city of Antwerp. The western half of the province has a high urbanisation grade, whereas the eastern half of the province is mainly rural.

Cancer care facilities
The province of Antwerp has 36 hospitals, of which 6 have an oncology centre. Five hospitals in the registration area have radiotherapy departments

Registry structure and methods
The ACR is located at the Department of Epidemiology and Community Medicine of the University of Antwerp and is funded by the Flemish government.

The staff of the registry consists of a head medical officer, an epidemiologist and 7 registration workers. The registration process is based upon the Dutch cancer registry, characterised by active case finding, data collection and coding by the registration workers in all hospitals and the major private pathology laboratories of the province. There is no access to death certificates; therefore these are not used for case finding.



Interpreting the results
Coverage of the entire province was not complete until the incidence year 2000, when all hospitals in the registration area participated in registration; under-registration in 1998 and 1999 may be estimated around 5%. Some organised screening programmes exist for cervical, breast and prostate cancer; however, these data are not being used directly for case finding.

Use of the data
The ACR reports crude, age-specific and age-adjusted (ESR) incidences annually; moreover, each participating hospital obtains an annual report on all of its own diagnosed and/or treated cancer patients. Registration data are provided for research purposes to internal as well as external institutions.

Our data are used directly by local health authorities, for evaluation of screening programs and indirectly: hospitals report to the federal health department using cancer registration data.

Source of population
Official data from population register, provided by the administration.

Multiple primary rules used
IACR rules (1990).

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Belgium, Flanders

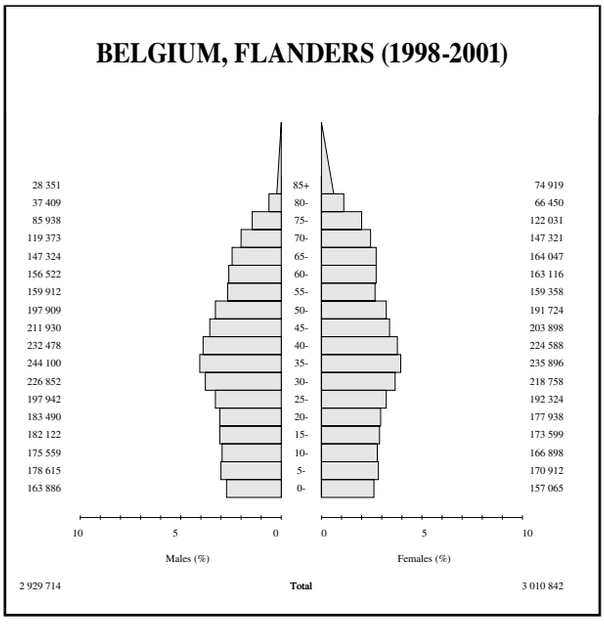
Registration area
Flanders is situated in the north of Belgium and comprises 5 provinces. The estimated mid-year population for 2000 was 5 946 402, of whom approximately 5% are foreigners. The mean population density is 439 inhabitants per km².

In 2000 people over age 60 made up 22.2% of the total population, with 11.7% older than 70 years of age. The life expectancy at birth was 76.0 years for men and 81.9 years for women.

Cancer care facilities
In 2000 there were 3.1 physicians per 1000 inhabitants and 5.1 general hospital beds per 1000 inhabitants. The medical care institutions are easily accessible and medical care is provided by 116 general hospitals.

There are no specific cancer hospitals or regional cancer centres. Oncological care and radiotherapy are provided within general and university hospitals. For the whole country in 2000, 163 radiotherapists and almost 287 pathologists were registered at the Ministry of Health and Social Affairs. In 2000 there were 25 radiotherapy services in Belgium, of which 14 were located in the Region of Flanders.

More than 99% of the population living in Flanders are affiliated with one of the National Health Services for mandatory medical insurance. All of these National Health Services are grouped in a National Health Insurance System.



Although there were no regional or national organised screening programs for cervical nor breast cancer until June 2001, many women did have a Pap smear and mammography taken regularly at that time. In June 2001 a national breast cancer screening program was launched for women aged 50–69 years. There are also local initiatives for screening of cervical cancer and malignant melanoma. Opportunistic PSA testing has been used increasingly.

Registry structure and methods
The Belgian Cancer Registry is subsidised by the National Ministry of Public Health and by the Ministries of Public Health of both communities (French and Flemish). Since 1983 the National Health Services have been collecting data on newly diagnosed malignant tumours among their contributing members and families. In Flanders, from 1996 onwards, different cancer registration systems, essentially the provincial cancer registry in Antwerp (AKR), the provincial pathology cancer registry in Limburg (LIKAR), the bronchus carcinoma registry for Flanders (VRGT), some hospital cancer registries and almost all pathology laboratories, have been integrated in a cancer registration network. In 2003 the Flemish staff of the cancer registry consisted of 2 data managers, a part-time pathologist and a physician coordinator.

Both active and passive data collection methods are used in this network, but all data are provided electronically to the Belgian Cancer Registry in a predefined structure. Due to privacy regulations only encrypted data are allowed to be transmitted. The personal identifiers are encrypted by the same procedure at the hospitals, the National Health Services and the pathology laboratories.

All invasive and *in situ* tumours are registered. Topography, morphology, behaviour and differentiation are coded to ICD-O-2. In Flanders the majority of the pathologists work with CODAP codes which are translated automatically to ICD-O-2 by means of a computer program. For staging of tumours the TNM classification is used. The IARC rules for classifying multiple primaries were adapted slightly.

All incoming data are checked at the Belgian Cancer Registry with a control programme based on the rules of the IARC-check program and supplemented with other controls developed at the registry. Multiple notifications for the same tumour are linked according to the encrypted personal identifier at the Cancer Registry and summarised by automated decision rules. A significant number of cases are resolved manually.

Death certificates are also transmitted to the cancer registry, but they are anonymous and do not permit any trace-back procedure. They can only be used as an additional check for date of death and the cause of death. The independent data set method was used in 2005 to evaluate the completeness of the cancer registry (year of incidence 2000–2001). The completeness was estimated to be 98.2%.

Use of the data
Annual incidence data by sex, age, site and geographical units are routinely produced. Detailed data for the major cancer sites are analysed in separate chapters that are published and distributed. Survival data were published for the first time in March 2006. Data are also displayed on the website of The Belgian Cancer Registry and www.tegenkanker.be/kankerregistratie. Numerous requests for data are provided to research workers, clinicians, health care planners, paramedics and the general public.

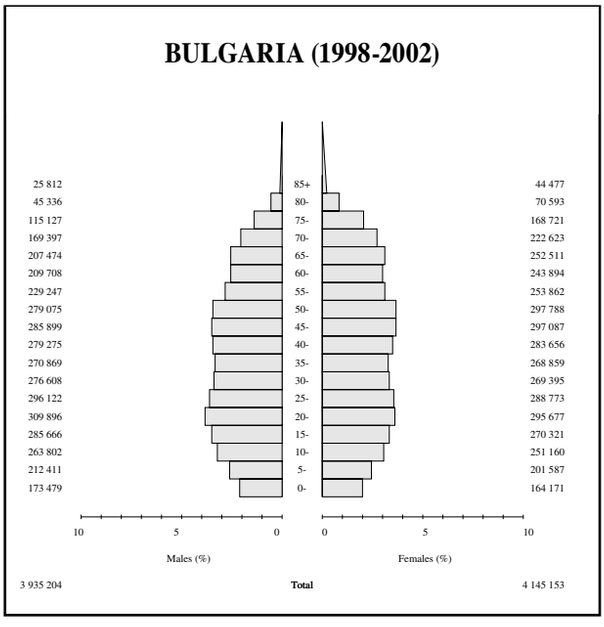
IACR rules (2004) on CI5 IX period.

Bulgaria

Registration area
The Bulgarian National Cancer Registry (BNCR) covers the whole population of Bulgaria. The population at the most recent census (1 March 2001) was 7 932 984. About 70% of the population (<6 000 000) lives in urban areas. The predominant religion is Eastern Orthodox Christians (85%); 13% are Moslems and nearly 1% Catholics.

Cancer care facilities
Until 1989, medical care in Bulgaria was free. Private medical practice has been permitted since 1991. National Health Insurance was introduced in 2000. Health care is mostly public, including regional hospitals, university clinics, specialised hospitals and primary health establishments, supplemented by private practitioners and hospitals.

A specialised cancer network was founded in Bulgaria in 1952. It includes 13 Regional Oncological Centers (dispensaries), covering populations between 370 000 and 1.2 million inhabitants. Another part, National Oncological Hospital (NOH) is located in Sofia. The specialised cancer system provides prevention, diagnostic, treatment (radiotherapy, surgery, chemotherapy) and follow-up services for cancer patients. In 2000 a total of 27 526 physicians were engaged in healthcare activities, 471 of whom were physicians in oncological centres. Natioanlly there were 60 552 hospital beds, of which 2005 were in oncological centres.



Registry structure and methods
The Bulgarian National Cancer Registry, funded by the Ministry of Health, is part of the National Oncological Hospital. One physician, one statistician, one specialist in computing and six full-time clerks staff it. In each of the 13 dispensaries, there is a Regional Cancer Registry, usually staffed by one full-time physician and 2-3 clerks.

The BNCR uses active and passive methods of data collection. Compulsory registration of malignant diseases in Bulgaria was introduced in 1952. Every physician is required to send a "rapid notification" to the Regional Oncological Centre for each newly diagnosed or suspected cancer case, death from a malignant neoplasm, and since 1975 for cancer *in situ* as well. The rapid notification system was updated in 1992. From 1993 cancer patients have been followed up by type of treatment and date of death as well. In 2000 new items and codes were introduced according to European Network of Cancer Registries recommendations.

Other sources of information on cancer patients are medical records from oncological centres and other specialized hospitals, university clinics, primary health establishments (outpatient and inpatient), pathology and haematology laboratories, death certificates, Central Population Register, hospices, etc. Dispensary clerks frequently visit all hospitals with wards diagnosing or treating cancer patients, pathological laboratories, etc. to add to the rapid notification data.

In January 2006 the ICD-10 was introduced in Bulgaria; all cancer cases since 1993 have been recoded. To improve the registration system a check of the Central Population Register was made for all cases who died after 1998.

For registration of malignant neoplasms a new software product has been developed. In each regional register trained clerks, under the supervision of physicians, code the data. Processing includes verification of completeness, checking for duplicates by name, identification number (PIN), address and diagnosis, consistency and compliance between clinical and morphological diagnosis, computerised checking and correction of coding and typing errors. Histology is coded according to ICD-0-2. Benign lesions and those of uncertain behaviour are not registered. The BNCR uses IARC Tools Version 2.03 (2006) and DEPedits Version 1.00 (2006). Legislation for data confidentiality is not yet available in Bulgaria; thus each patient is assigned a unique ID number.

In the registry we currently compare (for completeness and accuracy) and evaluate the data between: incidence and mortality data; incidence data between 28 districts in Bulgaria and over time; incidence data between Balkan countries, etc. Every three months we receive information for all deaths from the Central Population Register in Bulgaria. This comparison is published in *Lung Cancer: Current Status and Perspectives, September 2005*; *Balkan Union of Oncology, Proceedings/ Educational Book, 5th Congress*, etc.

Interpreting the results
Despite active and passive methods of cancer registration there is possible nonregistration of cancer cases mainly among elderly people and among inhabitants of the rural areas. There are some omissions in coding cause of death (metastasis instead of primary site) as well, leading to a discrepancy between incidence and mortality data, especially in liver cancer, esophageal cancer, etc.

Bulgaria now has opportunistic screening for breast cancer and cervix uteri cancer funds from the National Health Insurance Fund. A Strategy for Prophylactic Oncological Screening in Bulgaria was created for 2001–2006. It includes breast cancer, cervical cancer and prostate cancer. The Strategy was accepted by the Council of Ministers on 23rd of April 2001 but it was not undertaken for various reasons (faults in program organisation, screening tests, interpretation of the results, etc.). PSA testing is not common.

Use of the data
The BNCR annually publishes cancer incidence data in Bulgaria. The data available in the BNCR are used for

epidemiological studies, reports, communications and the like. Bulgarian policymakers use cancer registry data for planning or evaluation of health services.

Source of population
Official estimate. Source: The National Statistical Institute (http://www.nsi.bg).

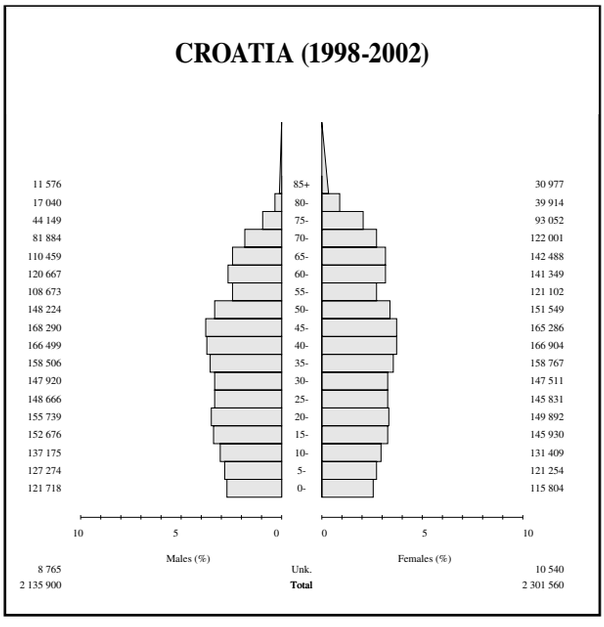
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation). This registry has the lowest histological verification rate in the monograph.

Croatia

Registration area
The Croatian National Cancer Registry covers the whole country of Croatia. The Republic of Croatia is situated along the eastern coast of the Adriatic Sea and covers an area stretching up to the last slopes of the Alps and deep into the Pannonian Valley to the banks of the Drava and Danube Rivers. Croatia is divided into three geographical regions: the Mediterranean, the Mountainous, and the Pannonian. Roman Catholics account for 87.8% of the population. Administratively, the country is divided into 20 counties and the City of Zagreb.

Cancer care facilities
In 2003, the health service entry points are 2372 primary care physicians, i.e. general practitioners, gynaecologists and paediatricians. There were 23 general hospitals. In addition, there were 12 clinical and two clinical teaching hospitals, and some specialised hospitals, of which one was dedicated to oncology. Most health institutions admitted oncology cases, but the main regional oncology centres with a full range of services are located in the clinical hospitals in Zagreb, Split, Osijek and Rijeka.



Registry structure and methods
The registry is part of the Chronic Disease Epidemiology Service at the Croatian National Institute of Public Health in Zagreb, the capital of Croatia, and is funded by the Ministry of Health and Social Welfare. A medical doctor specialist of epidemiology, a senior statistician, a technician and two data entry clerks staffs the registry full-time. Software support is provided by an external IT firm.

The basic notifications are from hospital discharge, pathology reports and primary care. Additional information is derived from every official death certificate that mentions cancer. Notifications include the name of the health providers (hospital or physician) so that they can be contacted for further information. Hospital discharge records in electronic format are used as a supplementary data source. Topography is coded in ICD-10, and morphology in ICD-0-2 classification.

Interpreting the results
There have been no organised population-based screening programmes in Croatia in the period 1998–2002. National population-based screening programmes were introduced in 2006 for breast cancer and in 2007 for colorectal cancer. However, opportunistic screening for cervical cancer has been going on since the 1960s, and the number of Pap smears taken yearly is increasing, as well as the number of mammographies. Opportunistic screening by faecal occult blood test has been going on in some regions, while PSA testing is becoming more common, but only in patients with urological symptoms.

Use of the data
Cancer incidence data have appeared each year in an annual report (bulletin in Croatian and English) and in the Institute's joint annual report since 1976. Analyses and observed trends are published in medical journals, masters and doctoral theses, and presented in congresses and other scientific gatherings. Survival analyses of registered cancer cases in the periods 1988–1993 and 1994–1998 have been carried out.

The registry was created in response to the growing public health problem posed by cancer. Data on cancer incidence and mortality are used for planning and evaluation of preventive measures and healthcare services.

Multiple primary rules used
IACR rules (2004) on historical data

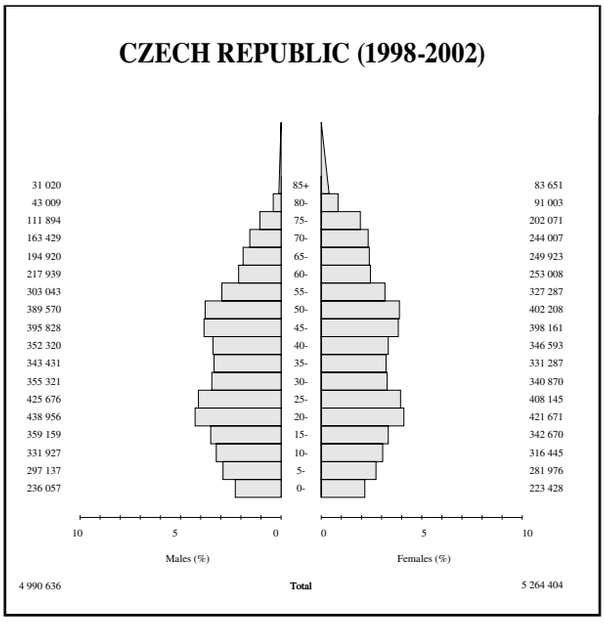
Czech Republic

Registration area

The National Cancer Registry of the Czech Republic is a territorial registry covering all residents of the Czech Republic, which lies in Central Europe. Mild climatic conditions do not vary markedly with geographical latitude over the territory.

The population of the Czech Republic is 10.2 million (2002). According to the 2001 Census more than 70% of the population is urban. A significant ageing trend in the population is accompanied by low fertility rates (during 1998-2002 total fertility rate was below 1.2). Life expectancy at birth was 72.1 years for males and 78.5 years for females (2002).

The population of the Czech Republic is ethnically homogenous. The majority of population (90.2 %) declared Czech nationality (Census 2001). The biggest ethnic minorities are Slovak (1.9 % of the whole population) and Polish (0.5 % of the whole population). Regarding religion, many are nondenominational (59.0%); the majority of believers (26.8% of the total population) were affiliated with the Roman Catholic Church.



Cancer care facilities

There is an extended network of health services in the Czech Republic. Oncological diseases are treated in specialised establishments in accordance with the kind of cancer. There are 83 outpatient establishments for clinical oncology, employing 112 physicians and 226 paramedical personnel. There are 39 outpatient radiotherapy departments with 117 physicians and 362 paramedical personnel. In the hospitals there are 11 departments of clinical oncology with 286 beds and 48 physicians, and 24 radiotherapy departments with 1185 beds, staffed by 113 physicians (as of the end of 2002).

Registry structure and methods

The National Cancer Registry of the Czech Republic (NCR) was founded in 1976 and connected with data collection on mortality from oncological diseases. However, cancer incidence has been registered since 1956. The NCR receives financial support from the Ministry of Health. Administrator of the NCR is the Institute of Health Information and Statistics (IHIS).

The National Cancer Registry of the CR itself has no regular staff. Programming is outsourced; data managing and analysis are done by three full-time employees of IHIS CR and two full-time employees of the Coordination Centre for Departmental Medical Information Systems (CCDMIS has an executive role in managing NCR). About 120 professionals are responsible for data entry (mostly hospital nurses) and about 80 physicians look after data entry and proper classification.

In the Czech Republic reporting of malignant neoplasms, in situ neoplasms and neoplasms of uncertain or unspecified behaviour is obligatory. The report is returned by the physician who diagnoses the neoplasm. Data collection is performed with the aid of Regional Units of the NCR, which collect the mandatory reports, histopathological reports, discharge reports, protocols on surgery, etc. These data are collated by the workers of the NCR Regional Units.

Collated data are transferred electronically to the Registry. All data are collected, processed and transferred to the central database using unified software with built-in online controls. Data are kept confidential in the recording and data transfer process. The central unit updates the Registry after checking and eliminating duplicates. This process is supplemented by annual comparison with the database of deaths run by the Czech Statistical Office; NCR also has access to the death certificate database, which is used for additional case-finding.

Apart from this statistical activity, patients are followed continuously (except non-melanoma skin cancer patients). Specialised follow-up (dispensary) health establishments return a mandatory check-up report for each case after 1, 2, 3, 4, 5, 7 and 10 years, then every five years and on the patient's death. The Regional Units employ physician cancer specialists and nurses on part-time contracts, mostly in addition to their practice in the field. The centre in IHIS has three specialists working directly in NCR activities.

Interpreting the results

The first organised screening programme in the Czech Republic was introduced in August 2001 for colorectal cancer. Women and men older than 50 years are involved in the colorectal screening programme. Nationwide organised breast cancer screening of women aged 45–69 was introduced in September 2002. Opportunistic screening for cervical cancer could influence incidence rates. In the Czech Republic PSA testing was introduced in 1990 and has been done routinely since 1992.

Use of the data

IHIS publishes a yearbook entitled *Cancer Incidence in the Czech Republic*, containing detailed data on incidence of neoplasms and mortality from cancer. Additional details (stage of disease, therapy) are analysed for 10 selected diagnoses. The Central Unit in IHIS processes additional data responding to about 50 special requests a year, from specialists as well as the lay public (media), and compiles

additional special publications. Other publications using registry data are prepared by other specialists or organisations.

Although IHIS of CR is not involved in epidemiological research, data of NCR of CR are submitted to scientists (e.g. researchers in Masaryk Memorial Cancer Institute). One of the tasks of the National Oncological Programme (NOP) is to support continuity, stabilisation, modernisation and practical utilisation of the database for controlled preventive and diagnosis-treatment care in oncology. NOP was officially supported by President Vaclav Klaus and by Ministry of Health of CR. The politicians devote great interest in oncological data. Practical cancer incidence data are used to evaluate the quality of hospitals' services.

Source of population

Postcensal estimates. The population estimates for 1998–2000 are based on the 3 March 1991 Census and for 2001–2002 on the 1 March 2001 Census.

Multiple primary rules used

IACR rules (2004) on historical data.

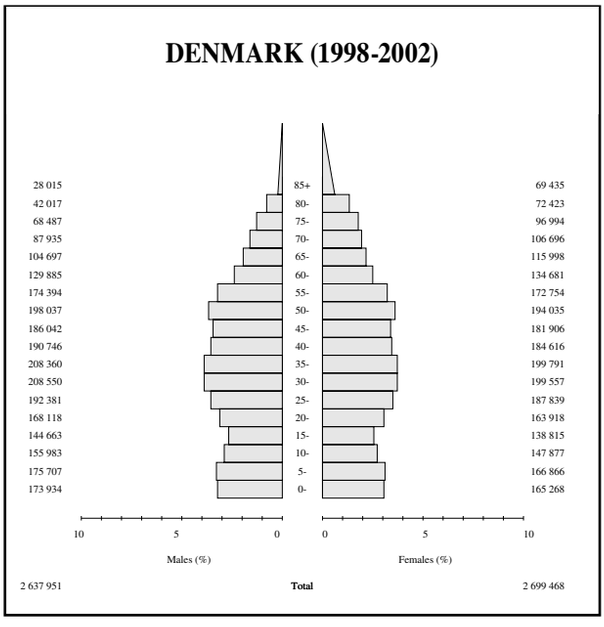
Denmark

Registration area

The Kingdom of Denmark, excluding Greenland and the Faroe Islands, covers 43 080 km^2 between latitudes 55 and 58° N, and longitudes 8 and 12°30′E. The mean population of Denmark was 5 340 000; it is of Caucasian stock and fairly homogeneous. Approximately one third of the population live in the greater Copenhagen area, 40% live in provincial towns of 10 000 to about 200 000 inhabitants, and the rest live in rural areas. Since 1968 all inhabitants have been given a unique personal identifying number, used in most registration systems, including the cancer registry. A central computerised population register keeps a continuously updated file of personal information on all inhabitants.

Cancer care facilities

The medical care system is organised into a private sector of general practitioners and specialists under contract with the National Health insurance, and a public sector operating hospitals under the authority of the counties and municipalities or the Danish State. Health care is provided free to all inhabitants. Cancer surgery is carried out both at general hospitals and at oncological centres. The hospital departments are serviced by 23 institutes of pathology. Non-surgical cancer treatment is partially centralised at five university hospitals with radiotherapy and oncology expertise and one regional oncological centre (Vejle Hospital). Almost the entire population is capable of reaching a specialised cancer centre within a few hours by ground transport.



Registry structure and methods

The Danish Cancer Registry was founded in May 1942 as a nationwide programme to register all cancer cases in the population. Incidence figures are available from 1 January 1943. Registration is compulsory by administrative order as of 1 March 1987, today incorporated in the National Health Law. This order also covers Greenland, and a similar order was issued for the Faroe Islands by the Faroe authorities. Data from Greenland are not included in the Danish incidence figures, but published separately. Data from the Faroe Islands are not included in the Danish Cancer Registry. The registry was, until January 1997 administratively part of the Danish Cancer Society, but has since then been the responsibility of the National Board of Health. A close collaboration between the Cancer Registry and the Danish Cancer Society that holds the full and regularly updated copy of the cancer registry for research purposes has been established. The Cancer Registry operates under the law on public authorities registries with instructions established by the Ministry of Health and supervised by the National Data Protection Agency, whereas the Danish Cancer Society copy of the Danish Cancer Registry operates under the law on private registries also supervised by the National Data Protection Agency. Data extraction and requests for data for research projects external to the Danish Cancer Society must be forwarded to the Cancer Registry at the National Board of Health.

Upon receipt at the cancer registry, notifications are checked and coded. Medical coding is carried out by physicians (1½ full-time equivalent) and trained medical coding staff (10 full-time persons), supported by an academic staff and IT coordinator (1 full-time equivalent). Duplicate registrations are readily picked up with the help of the personal ID number. The entire coding process is supported by computer checks of consistency between variables (sex, codes, procedures, etc.), warning programmes and manual check procedures. New tumour cases are then included in the registry's computerised database and additions or corrections are made to previously notified cases. If the information received is incomplete or contradictory, an inquiry is made to the notifying clinician. All data up to 1977 were classified according to a modified version of ICD-7 expanded to include information on histology and tumour behaviour. All cases diagnosed since 1978 have been classified according to the ICD-O as well as the modified ICD-7.

Reported cases of cancer are linked to the Central Population Registry using the personal identification number, the identity is checked and information corresponding to the date of diagnosis is transferred to the registry file.

The entire registry database is cross-checked annually by computerised record linkage with all deaths that occur in the country. Medical certification of death by medical doctors is compulsory. Follow-back on death certified cancer cases unreported to the cancer registry is accomplished by mailed enquiries to the certifying physician or hospital. Less than 2% remain as death-certificate-only cases.

Computerised medical information systems on hospital discharges have been operating nationally since 1977. Since 1987, cases are also captured from this registry but only included if confirmed. In preparation for extensive computerised data capture from 2004, the reporting of cancer to the discharge registry was expanded and improved to fulfil the requirements of the cancer registry.

Interpretation and use of data

Assessments by linkage to patient discharge registers, pathology registers, and patient series have shown that the completeness of the registry is 95–97%.

The registry produces morbidity statistics in relation to variation over time, age and geographical location, and is used extensively for research. Since 1978, incidence data

have been published for each year separately. From 1999 onwards the annual incidence publication can be obtained electronically from http://www.sst.dk (search term: cancer) at the level of ICD-7, and tabulated electronically from 1977, or from the NORDCAN database http://www.ancr.nu where annual data are available from 1972.

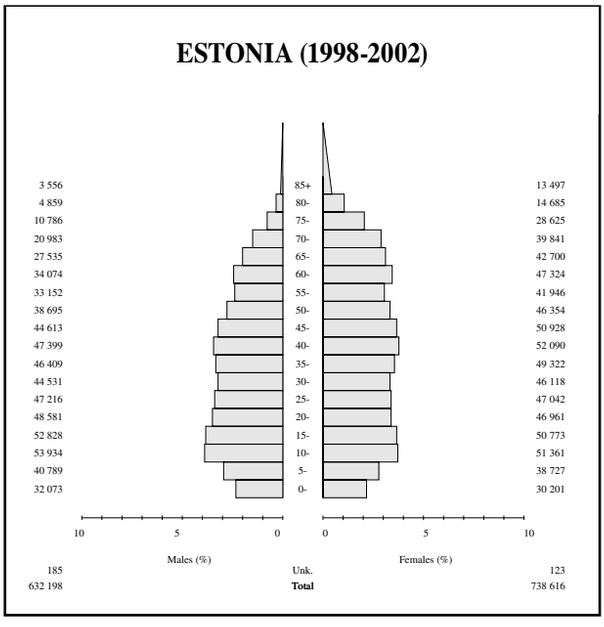
Source of population
A continuous count of the population is maintained. The mid–year point has been taken for each year.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Estonia

Registration area
The Estonian Cancer Registry (ECR) covers the whole Republic of Estonia, population 1.4 million according to the 2000 census. Of the total population at the 2000 census, 68% were Estonians, 26% Russians, 2% Ukrainians, 1% Byelorussians and 3% other ethnic minorities; 69% of the population was living in urban areas. The life expectancy at birth was 65.1 years for men and 76.0 years for women.

Cancer care facilities
After Estonia regained independence in 1991, the national healthcare system was reorganised from a state-controlled system to a decentralised health-insurance-based system. Patients suspected of having cancer by the primary and secondary healthcare facilities are mostly referred to two specialised cancer hospitals, which provide radiotherapy, cancer surgery and chemotherapy. Some cancer treatment is performed in general hospitals (surgery) or other specialised hospitals/ departments (neurosurgery, haematology, paediatric oncology).



Registry structure and methods
Cancer registration in Estonia dates to 1953 when compulsory registration of incident cancer cases started in the former USSR. The Estonian Cancer Registry was founded in 1978, while reliable incidence data are available since 1968. Until 1991, the Registry consisted of two subdivisions: (a) The Department of Statistics of the Estonian Cancer Centre (ECC), and (b) Department of Epidemiology and Biostatistics of the Institute of Experimental and Clinical Medicine. In 1991, the former of these subunits, responsible for the data collection, was renamed the Estonian Cancer Registry; the scientific analyses based on the Registry's data continued to be a responsibility of the latter subunit (since 2003, the Department of Epidemiology and Biostatistics of the National Institute for Health Development). The year 1994 was a landmark of major reorganisations in the Registry, particularly in the data collection procedures and the structure of the database. The Registry is funded from the state budget and employs a staff of five (Director, Data analyst, Physician-Data Manager, two Coding Clerks). Since the end of 2001, the ECR has operated as a subunit of the North-Estonian Regional Hospital Foundation's Cancer Centre.

Reporting of cancer cases in Estonia is compulsory. The Registry receives notifications from treating physicians and pathology and haematology laboratories. Coding and input are carried out in the Registry. The cancer patients are followed up to death or emigration. The data file for all death certificates issued in Estonia was provided annually by the Statistical Office of Estonia, and the Registry performed a trace-back procedure for cancer cases first notified by a death certificate. But due to the lack of legislative basis, the Registry has no access to death certificates issued in Estonia since 2001; therefore the incidence data may also be incomplete.

For updating the migration data and other personal data, in 2000 the Registry started regular linkage with the Population Registry (founded in 1992 when the national identification code was introduced in Estonia). In 1998, the data confidentiality issue was drastically emphasised in the public media. To solve the conflict between the Ministries and specify the legal aspects of personal data protection, the forwarding of notifications to the Registry was suspended for a month by administrative order. In February 2001, the Minister of Social Affairs issued a revised Decree (No. 21) on Cancer Registration and Running the Estonian Cancer Registry, providing access to the Registry's data in accordance with the Personal Data Protection Act. Recently, the Ministry of Social Affairs of Estonia has started to modify the existing laws in order to create the legal basis for all health registries, including the ECR.

The quality of the ECR's data has not been formally evaluated; the first study that partially covered this subject was carried out within the framework of a doctoral thesis by a young researcher and published in 2005.

Interpreting the results
No nationwide organised mass screening programmes for the early detection of cancer have been introduced in Estonia. However, the wide use of PSA testing since 1993 may have caused the rapid increase in detection of prostate cancer.

Opportunistic mammographic screening was introduced in some regions of the country in the 1990s and in the whole country in 2002. Also, an early detection project for cervical cancer in Estonia was introduced in 2003, and all regions were included by 2004.

Use of the data
The Registry publishes annual reports of cancer incidence, highlighting also time trends in incidence (the first report available for 1996, the last for 2000). Registry data have been used for a number of descriptive and analytical epidemiological studies, including international comparisons. In 1996, a statistical compendium, *Cancer in Estonia 1968–1992: Incidence, Mortality, Prevalence, Survival*, was published.

For the first time, the National Cancer Strategy was developed by the Working Group and presented to the Government in Spring 2000, but was not approved and financed. The present version of the Strategy covering the

years 2007–2015, was submitted to the Government in 2006, and state funding will start in 2007.

Source of population
1998–1999: Estimate, based on 1989 census, making allowance for births, deaths and migration and revised after 2000 census. 2000: census. 2001–2002: estimate, based on 2000 census, making allowance for births and deaths but not for migration.

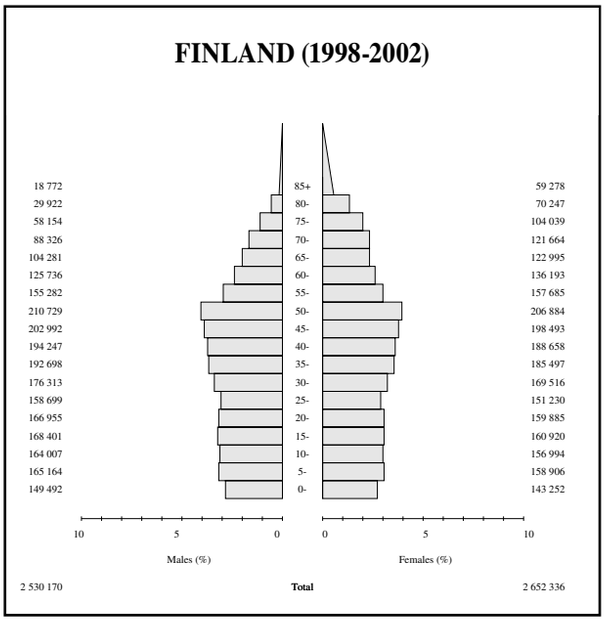
IACR rules (2004) on historical data.

Finland

Registration area
The Registry covers the whole of Finland (area 338 145 km^2), which is bordered to the north by Norway, to the east by Russia, to the west by Sweden and the Gulf of Bothnia, and to the south by the Gulf of Finland. The average altitude is 150m. Finland has 33 615 km^2 of inland water and belongs to the coniferous forest zone. The population of Finland is 5 181 000 (2000). Ethnically, the Finns are Caucasian, and of mixed origin, including Baltic, Scandinavian and probably eastern elements; 85% are Lutherans. The official languages of the country are Finnish and Swedish; 5.6% of the population speak Swedish as their mother tongue. The main occupational groups are: industry (26.8%), services (65.5%) and agriculture and forestry (6.1%). Some 60% of the population lives in urban municipalities. The population of Helsinki with its suburbs accounts for 18% of the total. The life expectancy at birth is 73.7 years for males and 81.0 years for females.



Cancer care facilities
In 1999 Finland had 15 800 physicians (3 per 1000 inhabitants) and 39 700 hospital beds (excluding psychiatric hospitals). The country is divided into 22 healthcare districts, of which five (Helsinki, Turku, Oulu, Kuopio and Tampere) have a university teaching hospital. Diagnosis and treatment of cancer is only partly centralised; cancer surgery is practiced in all major hospitals and also in many smaller clinics. Nine hospitals have a radiotherapy unit. Specialised paediatric oncological services are available in five university hospitals.

Registry structure and methods
The Finnish Cancer Registry (Institute for Statistical and Epidemiological Cancer Research) was established in 1952 on the initiative of the Cancer Society of Finland. Data on newly diagnosed cancer cases have been collected since 1953. Finland has been included in all the previous eight volumes of Cancer Incidence in Five Continents.

The total number of employees in the registry is 36, of whom 22 are at the cancer registry and 14 at the Mass Screening Registry (part of the Finnish Cancer Registry). There are 7 senior officials; IT personnel, secretaries and clerks account for 20 more, and researchers an additional nine.

The principal sources of information on cancer cases are physicians and hospitals, pathological laboratories and death certificates from Statistics Finland.

Reporting of cancer cases has been compulsory since 1961. If needed, requests are sent to notifiers in order to ensure accurate information of the identity of the individual in question, and primary site and date of diagnosis of the tumour. Coding of information at the Cancer Registry has always been done or supervised by a physician. Case identification is based on the personal identification number used in Finland since 1967. This also enables accurate follow-up of cancer patients for death through official sources. Besides continuous quality control procedures, formal evaluations also take place.

Nationwide screening programmes for breast, cervical and colorectal cancer are coordinated, monitored and evaluated by the Mass Screening Registry that is a part of the Cancer Registry. Opportunistic PSA testing is very common.

Use of the data
Apart from producing routine statistics (annual incidence rates by sex, age, primary site and healthcare district) and data for planning and health education purposes, the Registry is actively engaged in research on cancer epidemiology, biometrics and cancer patient survival, and provides material for clinical and pathological studies, and follow-up data on cancer patients. The Registry also acts as a consultant body in Finland on issues related to cancer epidemiology and research.

Source of population
A census count of the population is performed on a continuous basis by the Population Register Centre. The average annual population for 1998–2002 is published by Population Statistics, Statistics Finland.

Multiple primary rules used
IACR rules, modified by the cancer registry.

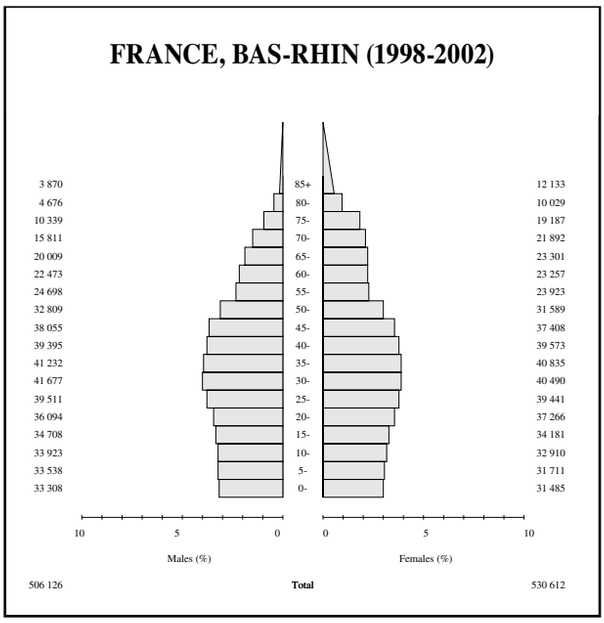
Notes on the data
C44 does not include basal cell carcinoma.

France, Bas-Rhin

Registration area

The "département" (French administrative district) of Bas-Rhin constitutes the northern half of the Alsace region, occupying the west side of the plain drained by the Rhine, which represents a natural border with Germany. On the opposite side the Bas-Rhin reaches the massif of the Vosges on the west, with a total area of 4 58 km^2. The town of Strasbourg is its regional centre. Forest covers 30% of the land area. The maximum altitude (1100m) is reached in the Vosges, and the minimum (32m) on the Rhine plain. The climate is temperate to semi-continental.

The population consisted of 1 026 120 inhabitants in 1999 (density: 216 inhabitants/km^2). Of these, 54.4% live in an urban environment in agglomerations with over 5000 inhabitants, and 27.6% in villages with fewer than 2000; 40.8% live in the urban district of Strasbourg. The population is slightly younger than the general French population.



The economically active population amounts to 53.1% of the total population: 67.0% of these work in the services sector, 30.8% in industry, and 2.2% in agriculture.

The département is without mineral resources and does not produce any raw materials, but has a major energy-production industry (petrol refineries and hydroelectric stations). The mechanical and electrical construction industry and the food industry (including breweries and wine production) are the most important. Agriculture plays an important role in spite of the low percentage of the population employed in this sector.

Bas-Rhin is a relatively wealthy département: incomes are high, and the level of consumption is also high, notably for food. Life expectancy in 1999 was 75 years for males and 82 years for females.

Cancer care facilities

Bas-Rhin has a high level of medico-social equipment, with 8457 hospital beds in 1999 (1 bed per 121 inhabitants), 1636 general practitioners and 1802 specialists. Hospitals employ 37.2% of all doctors. Many scattered small rural hospitals allow for hospital care close to the place of residence. More than 70% of cancer patients die in hospitals.

Registry structure and methods

The activity of the Cancer Registry of Bas-Rhin began in 1974. The registration of cases covers the resident population of the département of the Bas-Rhin.

Cancer registration is active, the doctors from the registry visiting each of many sources regularly to establish lists of new cases and to complete an epidemiological questionnaire. The lists from each of these sources are compared to ensure complete registration and to eliminate errors, particularly duplicate registrations. Cancers discovered by autopsy are registered. Death certificates are not used as a source, but serve only to verify the completeness of registration.

For each case of cancer registered, the identity and address of the patient are noted as well as the date of diagnosis, the method of diagnosis, the pathology department, the identification number of the pathological examination, the topography and morphology coded to ICD-O, and the behaviour. The two sources where the most complete information was found are also noted, as well as the identification number of the medical file, the date of death or the date of last information concerning vital status of the patient.

The identity of the patients is used only to avoid registering more than once the same patient with the same cancer. The data are coded by the doctors who have visited the information sources.

Lesions or cancers diagnosed or discovered *in situ* and with histological verification are registered, but are not included in calculations of incidence.

Interpreting the data

Organised breast cancer screening of the population aged 50–65 has been carried out since 1989 (20 000 examinations annually). Organised screening for cervical cancer was introduced in 1994 for women aged 25–65. Screening for cancer of other sites is opportunistic.

Multiple primary rules used

IACR rules (2004) on historical data.

Notes on the data

C44 not available.

France, Calvados

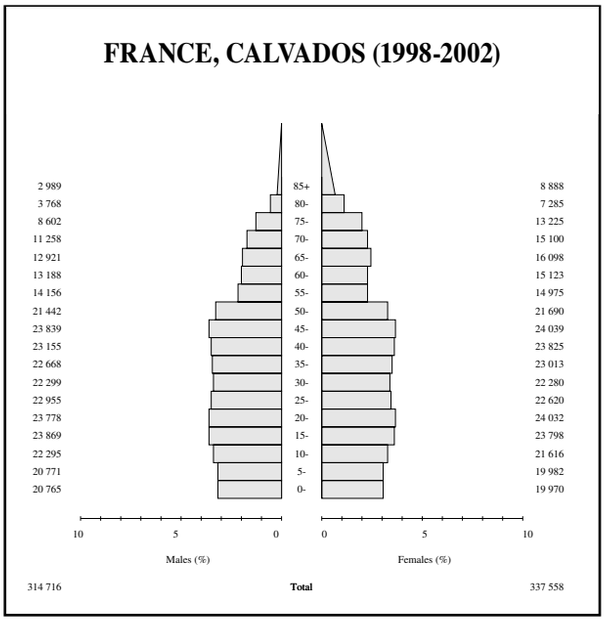
Registration area
The *département* (French administrative district) of Calvados covers an area of 5548 km^2. Situated in Normandy, it includes parts of the Armorican Massif (Bocage) and the Paris Basin (Pays d'Auge, Plaine de Caen, Bessin). To the North is the coastline of the English Channel. The highest elevation is 365m above sea level. The département of Calvados includes 621 rural communes (37.7% of the population) and 84 urban communes. There are 652 273 inhabitants, of whom 6.9% are aged 75 years and older. Among those employed (250 725 individuals), 5.2% are in agriculture, 19% in industry, 5.6% in building, 13.6% in commerce, and 56.6% in the service industries. In 1999, unemployment was 7.4%.

Registry structure and methods
Two cancer registries, both located in Caen, the departmental capital, cover the département of Calvados. The general registry is located at the Comprehensive Cancer Centre François Baclesse, and the specialised digestive tumour registry at the University Hospital. These two registries are supported by the National Institute for Heath and Medical Research (INSERM) and by the Health Watch Institute (InVS) of the Ministry of Health. They also receive contributions from the Conseil Régional de Basse-Normandie. They are affiliated with the French Association of Cancer Registries (FRANCIM), and to the EUROCARE network.

Registration has been carried out without interruption since 1978, using data from private as well as public medical facilities. They include a University Hospital, one regional comprehensive cancer centre and one cancer hospital, 22 general hospitals, 2160 doctors including 1137 specialists, and five pathology laboratories.

Registration is active, and information is directly taken from the medical and pathology records. Death certificates are also referred to; however, cases for which information only originates in death certificates are not registered.

Completeness is ensured by linking the information collected from all sources. The index date is the date of first pathological diagnosis or, if not available, the date of first diagnosis (radiological or biological). TNM stage and treatment are routinely coded for digestive tumours. Follow-up information is collected at regular intervals from treating doctors as well as from public registry offices for all cases. Data from the different registries are linked periodically in order to exclude cases registered twice. Paper documentation is kept for each case.



Use of the data
In addition to analysis of incidence and trends, many studies are conducted: change of disease stage at diagnosis, evaluation of mass screening, evaluation of treatment impact on survival, and survival trends. Relationships between environmental factors and oesophageal cancer, colorectal cancer, peritoneal and pleural mesotheliomas are also studied, as well as occupational exposure to pesticides and cancer.

Source of population
INSEE: http://www.insee.fr.

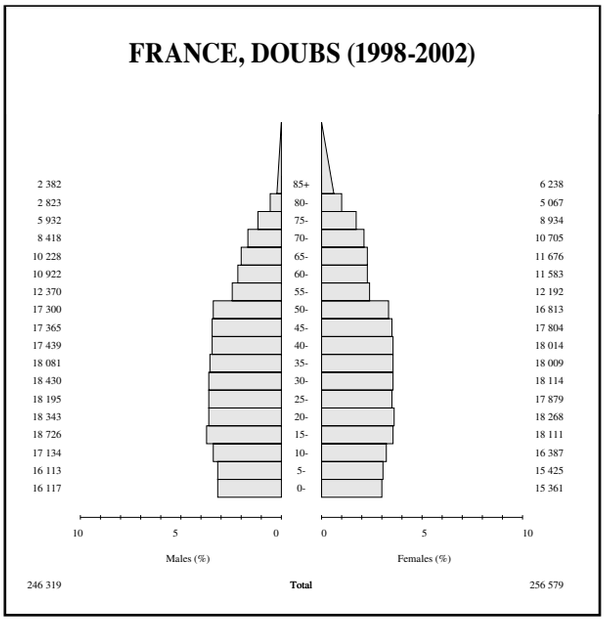
Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C44 not available.

France, Doubs

Registration area
The registration area is the Doubs *departement* (French administrative district), which covers 5234 km^2. According to the 1999 census, the total population comprises 499 062 inhabitants, of whom 346 720 live in urban areas and 152 342 in rural areas. The economically active sector includes 204 219 residents, and the unemployment rate is 10.4%. A notable proportion of residents living by the border cross it to work in Switzerland. There are 26 262 foreigners who work in the department, mostly from North Africa. The main religion is Roman Catholic.

There are two industrial areas: one in Sochaux-Montbeliard, with a large automobile factory, and the other in Besançon, the main city, which has several small industries that produce little or no pollution.



Cancer care facilities
There was one physician per 523 inhabitants in 1999. The entire population is covered by health insurance. Nearly all Doubs residents are treated in the departement. There are two oncology-radiotherapy wards, one in the teaching hospital of Besançon and one in the general hospital of Montbéliard. During the study period there was no cancer screening programme (the breast screening programme began in 2003).

Registry structure and methods
The Doubs Cancer registry began its activities in 1976. The registry is mainly supported by the InVS (Institut de Veille Sanitaire, a national agency funded by the Health Ministry, and by the teaching hospital of Besançon.

The registry uses active and passive casefinding from 38 sources of data consisting of public and private pathology laboratories, computerised hospital and clinic discharge recording systems, and medical records. The law allows physicians to transmit data to registries. In the registration area, there are only a few physicians who do not collaborate with the registry. The few residents treated outside of registration area are found using discharge recording systems of hospitals and clinics outside the registration area. Death registration is based on death notification in the patient's birthplace. The registry staff visits the sources and consults computerised medical records to collect data.

Data collection follows rules and recommendations of the ENCR. All types of invasive tumours are included (basal and squamous cell skin cancer are included) as well as uncertain-behaviour tumours and *in situ* tumours of the urinary bladder, and *in situ* tumours of the cervix and breast. Benign tumours of the brain and *in situ* tumours of colon and rectum and melanoma were not included for the study period but have been registered since 2003. French registries must maintain data security, confidentiality and information to patient following recommendations of the CNIL (Commission Nationale Informatique et Liberté), and the Doubs registry has developed internal checking and rules to follow these recommendations. Checking for duplicates is done at data entry, and regularly verified on the database using computer programmes.

Uses of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. It collaborates with the French Cancer Network FRANCIM to publish studies on national and regional incidence estimates as well as survival and evaluation of care studies. The registry also conducts specific studies in collaboration with local clinicians and epidemiologists.

Source of population
INSEE: http://www.insee.fr.

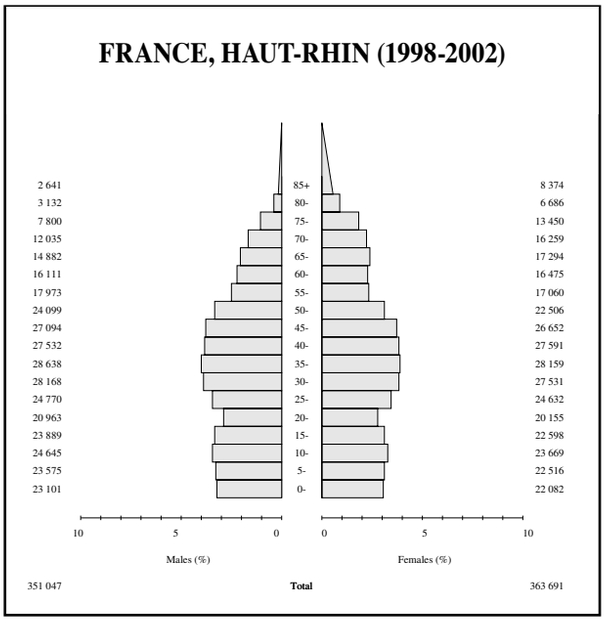
Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C44 not available.

France, Haut-Rhin

Registration area
The *département* (French administrative district) of Haut-Rhin, an area of 3522 km², is situated in the northeast of France. It is adjacent to the département of Bas-Rhin in the north (with which it constitutes the Alsace region), the département of the Vosges to the west, and the Franche-Comté region and Switzerland to the south. To the east, the Rhine separates Haut-Rhin from Germany. The altitude varies from 195m on the Rhine to 1424 m in the Vosges mountains. The climate is semi-continental, with fairly cold winters and hot, dry summers. The conditions favour the vineyards of the lower slopes of the Vosges. The area has four geographical regions: the Vosges mountains (crystalline massif), the lower hills of the Vosges (wine and fruit cultivation), the plain of the Rhine (land of loess and former marshland), and the Alsacian Jura (limestone).

The population of Haut-Rhin is divided into 377 communes, of which 269 are rural with fewer than 1000 inhabitants. Haut-Rhin has a higher proportion (47%) of economically active (aged 15–64) persons and a lower proportion aged over 65 years than France as a whole. Foreigners make up 8.1% of residents, of whom 69% were born outside metropolitan France. The population is 21% rural; 52% live in the 23 communes with more than 5000 inhabitants. The urban area of Mulhouse has 228 115 inhabitants. The average population density is 201 inhabitants per km², varying from 81 in the rural communes to 4975 in the commune of Mulhouse.



The unemployment rate is 9% among men and women. The industrial sector employs 25% of the active population (automobile, arms, chemicals, textiles, wood and paper, nuclear power); the agricultural sector 2% (market gardening, wine production, forestry), the building sector 6%, and the tertiary sector 67% (commerce, administration, education, health, transport). A special feature related to the geographical situation of Haut-Rhin is that 12% of the employed population resident in the département works in Switzerland or Germany.

Cancer care facilities
With 98 general practitioners and 63 specialists per 100 000 inhabitants, the medical coverage of the Haut-Rhin population is below the national French average (respectively 113 and 88). The hospital infrastructure, public and private, comprises 1582 beds in medical wards, 1141 in surgery, and 325 in gynaecology and obstetrics. There are two radiotherapy wards, one in the south (Mulhouse), and the other in the north (Colmar). There is no specialised cancer centre in the département.

Registry structure and methods
The Haut-Rhin Cancer Registry is a general population-based registry. Created in 1989, it is administered by an association under a specially constituted law for the purpose. It is entirely financed by local funds (local and regional groups, health insurance funds, the Anti-Cancer League).

The registry collects information on all new cases of cancer occurring among the inhabitants of Haut-Rhin, including those diagnosed and treated elsewhere. Registration is active. The main sources of information are pathology and cytology laboratories, and radiotherapy, oncology, paediatrics and haematology services. The medical information departments and medical records departments of the hospitals are also excellent sources of first notifications. Cases discovered at autopsy are registered, and identified as such. The data collected are systematically verified, completed or modified, using secondary sources (hospitalisation services, treating physicians). The average number of sources per registered case is over three. Death certificates are not used.

Data are entered using the IARC CanReg software.

Use of the data
The registry was established in order to obtain data on the burden of cancers in the area, so as to maintain an updated database for evaluation of public health measures in the prevention, screening and treatment of cancer.

Source of population
INSEE: http://www.insee.fr.

Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C44 not available.

France, Hérault

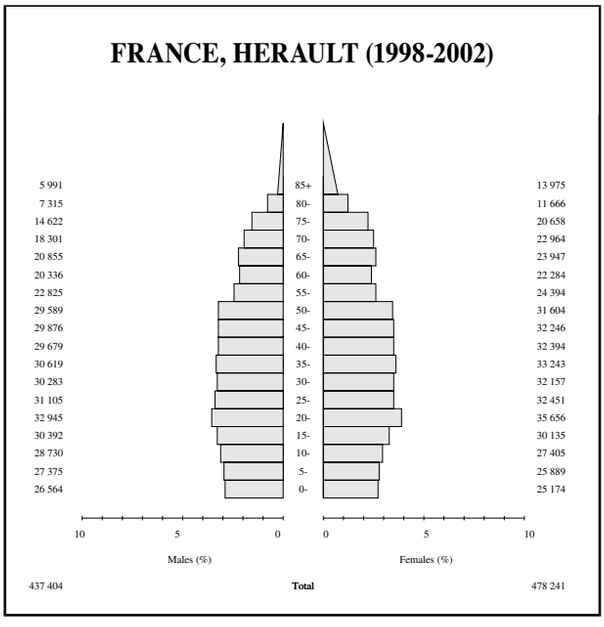
Registration area
The registry is located in Montpellier, the capital of the Hérault *département* (French administrative district), which is part of the Languedoc-Roussillon region and covers 6101 km^2 in the south of France, near the Mediterranean.

In 2000 the population of Hérault comprised 920 000 inhabitants (48% males, 52% females) with a population density of 151 inhabitants per km^2. The departement is highly urbanised (the urban population is 4.25 times the rural population).

Of the active population, 81.1% work in the services sector, 15% in industry and 3.9% in the agricultural sector. The unemployment rate is 14.5%.

The population is slightly older than the general French population (23.1% older than 60, vs. 19.8% in France). Life expectancy is 76.3 years for males and 83.2 years for females (vs. 75.9 and 82.9 years in France, respectively).

The birth rate is 12.0 per 1000 and the mortality rate 9.5 per 1000 (vs. 12.7 and 9.0 per 1000 respectively in France).



Cancer care facilities
Hérault has a high level of medico-social equipment, with 2.5 beds per 1000 inhabitants in medicine and 2.2 beds per 1000 inhabitants in surgery (vs. 2.2 and 1.8 per 1000 inhabitants in France respectively) distributed among one hospital specialising in cancer, 10 public hospitals (including one academic hospital in Montpellier and 6 small rural hospitals) and 16 private clinics. The medical coverage of the Hérault population is greater than the national average of 200 general practitioners and 246 specialists per 100 000 inhabitants.

Registry structure and methods
The majority of the registry's budget comes from the National Health Department through InVS (Institut de Veille Sanitaire) but also from INSERM (Institut National de la Santé et de la Recherche Médicale) and Hérault Committee's League against Cancer.

The registry staff consists of five persons: one medical epidemiologist, one secretary, two registrars and one investigator.

Our principal sources of information on cancer cases are 11 pathological laboratories, one hospital specialising in cancer, 3 radiotherapy units, 2 general hospitals, 10 private clinics, general and specialist practitioners, and the medical files of 2 health insurance companies. For data collection, 20% are collected via active search, 65% by passive notification, and 15% as pre-coded data from the hospital specialising in cancer. Registration is active: medical and pathology records are consulted directly by medical doctors and registry investigators.

The administrative information is coded by the registrars and all medical information is coded by the medical director of the registry. Death certificates are not used as a source.

All invasive and *in situ* cancers are registered, with the exception of basal cell carcinomas of the skin. Stages are registered for all localisations and coded according to the TNM 5th edition.

There is active follow-up of the registered cancer cases since 1997.

Interpreting the results
Since 1990, we have had two organised breast cancer screening programmes for women aged 40–49 years and 50–69 years. Hérault is the only French area covered by a cancer registry in which there is an organised breast screening programme for women aged 40–49 years.

Use of the data
A report of all data is published biannually. The last report was published in April 2005 for cancers diagnosed in 2001–2002. All incidence data, chronological tendencies and relative survival by sex, age and stages for each organ are detailed. Screening programmes for breast cancer are evaluated.

The Hérault Cancer Registry performs many studies (case–control studies, medical economic studies, evaluation of therapeutic practices), alone and in collaboration with other French or European registries.

Source of population
INSEE: http://www.insee.fr.

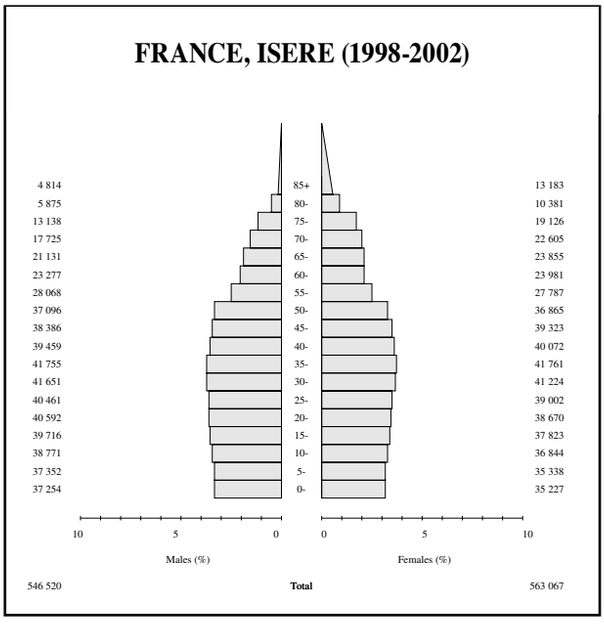
Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C44 not available.

France, Isère

Registration area
The Isère Cancer Registry covers the population of the *département* (administrative region) of Isère in southeastern France. Besides some recreational activities (e.g. ski resorts, lakes), industrial activities are important (chemical production), and research and teaching (universities). Less than 20% of the population resides in rural areas. In 2002 the population was estimated to be 1 126 000, with 301 000 people under age 20, 622 000 aged 20–59 years and 203 000 over age 60.

Cancer care facilities
In 2001, the density of specialised and general practitioners was 206 per 100 000 inhabitants. In December 1999, there were 3586 physicians in charge of the population's health in Isère. There are two specialist cancer hospitals, and diagnosis and treatment are also undertaken in general hospitals and private clinics.



Registry structure and methods
Of the registry's budget, 70% comes from the Isère General Council (Conseil Général) and from InVS (Institut de la Veille Sanitaire) and INSERM (Institut National de la Santé et de la Recherche Médicale). The bulk of the research work is funded by the French League against Cancer and by foundations or by contracts with industrial companies. The registry staff, both for registration and research work, consists of two clerks (part-time), two registrars (part-time), 1.6 medical epidemiologists, one statistician and one secretary. For some studies, extra medical interviewers are hired.

Among the sources of information, in Isère and in three contiguous areas, there are 34 laboratories providing pathological reports. The registry also obtains information from two hospitals specialising in cancer, 13 general hospitals, the network of hospitals in the city of Lyon, six private clinics and the medical files of two Health Insurance Companies. Since 1997, abstracts of the medical files from the hospital patient-disease information systems are received for most patients treated for cancer, at least for hospitals in the public domain. All of the information received is carefully checked and when judged insufficient, registry staff visit the sources where they scrutinise the records kept in the medical records departments. As death certificates are anonymous, they are of no use for case-finding. There is no active follow-up of the registered cases, except for specific survival studies.

Interpreting the results
An active screening programme (breast, colon and cervix) and well-implemented habits of PSA testing for prostate cancer may explain rather high incidence rates for these tumours, as compared with French standards. In operation since 1985 (PSA) and 1990 (screening), these activities probably no longer have an effect on trends, but some research has shown an increase in the proportion of localised compared to distant tumours, which supports a beneficial effect of those programmes for the population's health.

Systematic sending of medical record abstracts by hospitals may improve coverage in coming years.

Use of the data
A report for researchers and people in charge of cancer in Isère is published annually. The prevalence of cancer has been estimated. Mapping of disease is carried out by the registry. The screening programmes for breast, colon and cervix cancers are evaluated.

The registry also undertakes surveillance of occupational cohorts. In co-operation with other French Cancer Registries (FRANCIM) and the Institut de la Veille Sanitaire, the registry contributes to the detection of new cancer risks in the French population.

Analyses of different methods of diagnosis and treatment for some cancer sites, including breast, prostate, bladder, kidney and colon cancer, have been carried out as well.

Source of population
INSEE: http://www.insee.fr.

Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C44 not available.

France, Loire-Atlantique and Vendée

Registration area
The registration area is composed of the two *départements* (French administrative districts) of Loire-Atlantique and Vendée, situated in western France, which cover 13 535 km^2 and have a total population of 1 134 493 for Loire-Atlantique and 539 806 for Vendée according to the 1999 census. The population density figures were 172 and 84 inhabitants per km^2 in Loire-Altantique and in Vendée respectively. About 54% of the Loire-Atlantique population and 25% of the Vendée population live in urban areas (≥10 000 inhabitants).

Cancer care facilities
There are 23 public and 37 private hospitals in the two départements, including one university hospital and two anticancer centres. Most radiotherapy and chemotherapy structures are present in the 3 main towns (Nantes, Saint Nazaire, La Roche-sur-Yon). The two départements have 2613 general practitioners and 2520 specialists (respectively, 108 and 62 per 100 000 inhabitants).

Registry structure and methods
The Loire-Atlantique and Vendée Cancer Registry is a general population-based registry. Created in 1998, it is one of the biggest French Registry, affiliated with the association of French Cancer Registries (FRANCIM) and recognized by the National Committee of Registries (CNR). It is administered by an association according to the French association law of 1901. It is entirely financed by the General Council, the Regional Council, the Departmental League Against Cancer, the Loire-Atlantique private anticancer centre, the National Institute for Medical Research (INSERM) and the Health Watch Institute (InVS).

The registry is located within the university hospital of Loire-Atlantique (CHU Nantes) and the departmental public hospital of Vendée (CHD La Roche-sur-Yon). The registry is staffed by a medical epidemiologist, a part-time anatomopathologist and 10.5 full-time equivalent persons.

Cancer cases are found by an active search in the medical records from several sources of data. The three main sources are pathologists, medical information systems in the hospitals and clinics, and health insurance notifications. The registry staff visits these sources, where they scrutinise the records kept in medical records departments, to identify and abstract information on cases of cancer (diagnosis and treatment of cancers) among residents of the registry départements. Until now, death certificates have been forbidden by law to be used as data sources for registries in France.

Although cancer is not a notifiable disease, a few registration forms are received from private practitioners. Arrangements have been made with the hospitals outside the registration area to notify the registry of any resident cancer cases that they diagnose and treat.

Quality in the registry is monitored every four years by the National Committee of Registries (CNR). The Registry is monitored by the National Commission of Data Processing and Freedom (CNIL) for confidentiality.

Interpreting the results
Organised breast cancer screening of the population aged 50-74 has been carried out since 1996 in Loire-Atlantique and since 2002 in Vendée.

Uses of the data
The Loire-Atlantique and Vendée Cancer Registry has produced basic descriptive data and participated in collaborative studies at a national level. It prepares an annual report of cancer incidence, highlighting trends and changes. Some special studies have been carried out (including evaluation of clinical care for breast cancer or colon cancer, and survival).

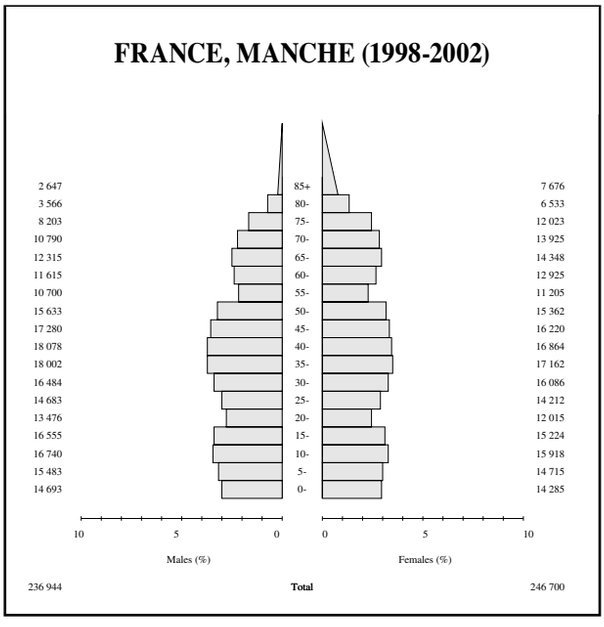
C44 not available.

France, Manche

Registration area
Situates in the area of Basse Normandie, the *département* (French administrative region) of the Manche covers 5938 km² and has 330km of coastline. It is a part of the Armorican massif and consists of three different zones: in the north the Cotentin peninsula; in the centre a formerly swampy zone, now meadows; in the south the hills of the Norman bocage, which reach 368m. The climate is of the oceanic type. The department contains 602 communes, 86% of which have fewer than 1000 inhabitants. The population is slightly older than the national average. It is mainly rural, with only 48% living in the five urban areas (of which half are in the only urban zone, Cherbourg, in the North) and density is low (81 habitants per km²).

The working population represents 43.2% of the total population. Among those employed, 47.5% are in the service sector, 19.9% in industry (predominantly farm produce), 14.4% in agriculture, 10.4% in commerce and 7.8% in building and public works. In 1999 the unemployment rate was 11.5%. The département has a low proportion of foreigners (0.8%). The economy is mainly agricultural, breeding representing 90% of this production. Fishing and tourism are developed in the coastal zones. There is an industrial area in the north, mainly the nuclear industry (nuclear waste reprocessing plant, surface storage facility for nuclear waste, power station) and shipyards.



Cancer care facilities
With 611 general practitioners and 511 specialists in 2002, the department has a low medical coverage. There are seven beds per 1000 inhabitants. The department possesses 11 public hospitals, general and local, and seven private care structures. There is no specialised cancer centre, but there are two radiotherapy units, one private in the south of the department, one public in the north which is a delocalised structure associated with the regional cancer care centre of the neighbouring department (Calvados).

Registry structure and methods
The Cancer Registry of Manche began its activities in 1994. The registry is based in Cherbourg, in the general hospital, and was created by an association of practitioners of the department. It is supported by the Ministry of Health, the Regional Council of Basse Normandie, the General Council of Manche, the local League against Cancer, communes, local associations, and industries. It is affiliated with the association of French Cancer Registries (FRANCIM).

Data collection is active in Manche and the surrounding departments. The registration of cases covers the resident population of the department of the Manche. The sources of information are regional, including 12 pathology and cytology laboratories, services of oncology, radiotherapy, paediatrics and haematology, and medical records departments of hospitals. After first notification of cases, every medical file is checked in regional, private and public, medical facilities, and then coded to ICD-O by the physician. All invasive and *in situ* cancers are registered except basal cell skin cancers. Death certificates are not used as a source of data. The registry carries out active follow-up of all cases from the municipal registry office.

The industrial characteristics of the north of the department led to the implementation of a specialised collection system for haematopoietic cancers. It consists of collection of reports from the medical biology laboratories of the department, validation by a haematologist, and records of immunophenotypic, conventional cytogenetic and molecular data, and the tumour cells are cryopreserved.

Use of the data
The Manche Cancer Registry produces basic descriptive data and participates in collaborative studies at a national and international level.

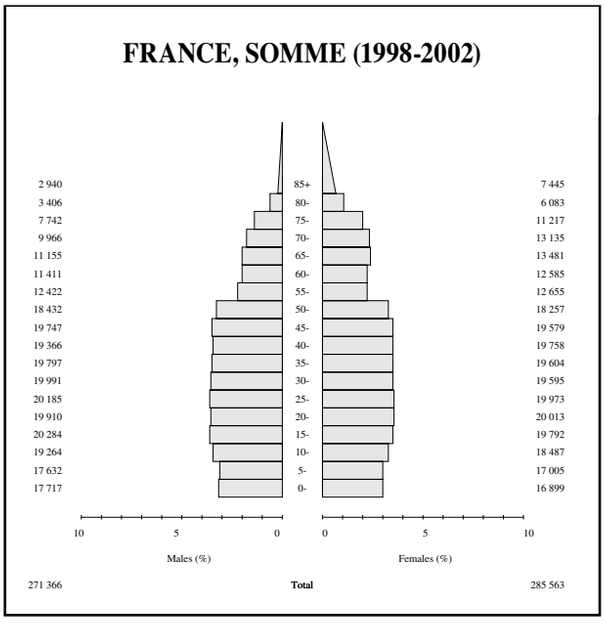
France, Somme

Registration area
Situated 140km from Paris, the Somme registry covers 6170 km^2, includes 60km of coastline and is composed of three main types of landscapes: Bocage in the West, Picardy plateau at the centre, and Santerre in the East, occupied by extensive cultures. The river Somme passes through and is bordered by ponds and marshes attracting many anglers and hunters. Tourism is developed. The Bay of Somme is a natural reserve and a landing zone for migratory birds.

The population is 41.5% rural. The West of the county is traditionally both rural and industrial, with factories producing taps and locks. There is also a large industrial area around Amiens.

The Somme Registry is the only general registry north of Paris. The population census in 2000 counted 557 121 inhabitants. Amiens is the principal town with 136 000 inhabitants; the other towns count less than 30 000 inhabitants.

The natural population increase by birthrate is +2.6% (INSEE 2003).



Cancer care facilities
There's no specialised cancer care centre in the département. Cancer care is shared by the University Regional Hospital and the general hospitals and clinics located in six towns of Somme. Ten percent of patients are treated outside the registration area in cancer care centres in Paris or Lille (to the north), or in a general hospital or clinic in Saint-Quentin and Chauny (Aisne département). Chemotherapy and radiotherapy are dispensed privately or publicly. Since about 1998 physicians groups have organised multidisciplinary examinations of patient records to improve quality of treatment and more consistently apply national consensus standards of care.

Since 1997 the regional health authority has recognised cancer as one of the priorities of the county. The registry is acknowledged to be the best tool to monitor cancer in the community.

Registry structure and methods
Somme cancer registry is managed by the "1901 law" and funded by Institut de Veille Sanitaire, Inserm, County committee of National League against Cancer and General Council. It forms part of FRANCIM network.

The registry is presided over by a Public Health Professor and counselled by another Public Health Professor; there are also an epidemiologist doctor (DM, PhD), a technical director (MSc), two inquirers/registrars and a secretary.

Cancer cases are collected by active search from listings and in medical records of about 90 sources of data. The two main sources are pathologists and medical information offices of public and private hospitals, but also registers of chemotherapy and radiotherapy in two clinics, The Regional Factory Inspectorate, Parisian hospitals administration, and regional cancer centres contribute to collection. Every year the registrars contact the outside sources and consult their records.

Cancer is not a notifiable disease in France. Identifying data are known only by registry staff. The Registry refers its work to "Commission Nationale Informatique et Libertés". Every four years the registry undergoes a quality audit by Registries National Committee.

Interpreting the results
A written agreement was signed with private pathologists and a public one in 1998, so the incidence has increased since then. There have been no changes in case definition and coding.

A screening programme for breast cancer has existed since 1990. In 1996 PSA testing was introduced, and we have likewise improved monitoring of prostate cancers.

There are no known unusual environmental, occupational exposures that may influence incidence.

Melanomas and squamous cell carcinomas of skin are not likely to be exhaustive, for many are diagnosed by non-corresponding pathologists in Paris.

Use of the data
Tables of incidence are carried out every year, and trends are produced for physicians on request. Area oncologists also receive the results of any specific studies.

Somme is a participating registry in the Eurocare project, Europreval and European Rare Cancers studies, Epilymph, and Eurodeucatam.

The Somme registry has been part of the Regional Schedule of Care organization since 1994, and a member of the Oncopic network.

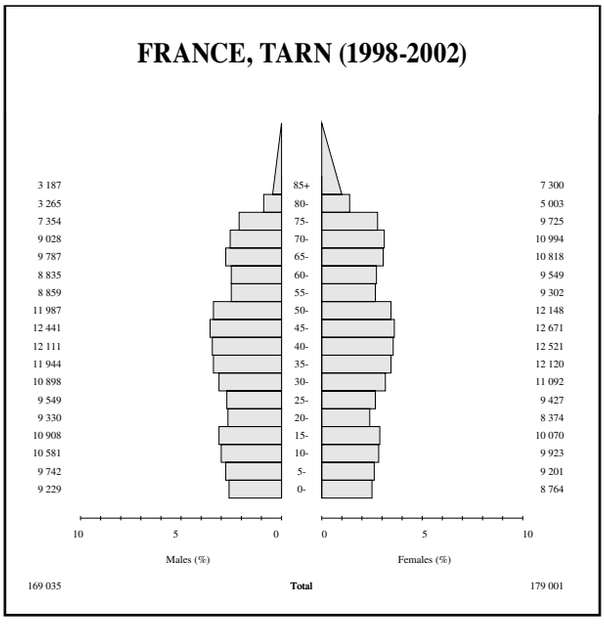
Notes on the data
C44 not available.

France, Tarn

Registration area
The department of Tarn is part of the Midi-Pyrenean region, situated in the southwest of France. It covers an area of 5758 km^2, mostly situated south of latitude 44°N and on longitude 2°E. In 1999, the population was composed of 343 402 inhabitants, with an urban/rural ratio of 1.65, and a ratio of French citizens to foreigners of 22.8. The population overall is slowly increasing (344 620 at mid-year 2000), but certain areas are undergoing quite a rapid increase while others are in recession.

The Tarn Cancer Registry was created in 1981. The arguments favouring the creation of a Registry in this department included the insufficient development of population-based cancer registries in France at this time and their absence in the Southwest, and certain characteristics of the department of Tarn such as the age-structure of its population and its relative stability with little migration, the large size of its rural population and some longstanding industries such as tanning, textiles and minerals.



Cancer care facilities
The department of Tarn is fairly autonomous in its provision of cancer care facilities. These are complemented by a cancer care network. Medical coverage is high, with 118 general practitioners and 118 specialists per 100 000 inhabitants, including four pathologists, two medical oncologists and two radiotherapists. There are four public hospitals and four private clinics in the department of Tarn. However, a few types of cancer (haematological, paediatric) are sent to the specialised services of the University Hospital or to the Regional Cancer Control Centre, both situated in Toulouse, the capital of the region.

In the department of Tarn, a programme of organised breast cancer screening has existed since 2003, and a colorectal cancer screening programme is underway. However these elements do not affect the data published here, given that the period of study is 1998-2002.

Registry structure and methods
The Tarn Cancer Registry operates as a French Law 1901 Association and is constituted by representatives of the medical and university sectors, and of the elected officials of the department and the Midi-Pyrenean region. Funding for registration activities comes from the General Council of Tarn, the departmental committee of the National League Against Cancer and the Ministry of Health. Research is funded through grants.

The staff, composed of 11 people (8.8 full-time equivalents) carries out both registration activities and research.

The search for the cases is active, and four investigators of the registry staff visit the data sources. The different laboratory, private and public hospital departments, administrative services and medical specialists in Tarn are regularly visited, with a frequency varying according to case-load in the different sources. The staff also visit Toulouse University Hospital and the Regional Cancer Control Centre. In recent years, the search for cases in public hospitals has been simplified by the existence of Medical Information Departments, which provide computerised lists of the cancer cases treated in those establishments. Name-specific death certificates are not used as a source of information, according to French law.

For each case, a notification form is completed with the medical and administrative information from the medical file. The names of the doctors involved in the diagnosis and the treatment of the patient, including primary physician, are systematically noted in order to contact them if necessary.

When the forms arrive in the registry, the secretaries first check the computing database to avoid duplicate registrations. The cases are then systematically checked in a second source by the investigators. If information is not sufficient, a questionnaire is sent to the regular doctor. These procedures allow missing information to be completed and patients with metastasis from or recurrence of a cancer diagnosed prior to 1982, or not resident in the area, to be excluded.

The medical information on the remaining cases is coded by the Medical Director of the registry, assisted by specially trained coders. The administrative data are coded by two secretaries. The data are then entered onto the computer of the registry, creating a computing file which can be updated when additional information from other sources reaches the registry. This file has been declared to the National Commission on Information and Liberty (CNIL).

Active follow-up by writing to the town halls where the patients were born and writing to the regular doctor is only carried out for cases that are the object of special studies.

Use of the data
In addition to basic descriptive epidemiology, the Tarn Cancer Registry carries out several studies, alone or in collaboration with other registries (the Association of French Cancer Registries FRANCIM and the European Network). These include estimates of the incidence and prevalence of cancer in France, the study of time trends, case–control studies and evaluation of diagnostic and therapeutic regimes for selected sites.

Germany, Federal States of Berlin, Brandenburg, Mecklenburg-Western Pomerania, Saxony-Anhalt and the Free States of Saxony and Thuringia

Registration area

The Common Cancer Registry (CCR) covers the population of the federal states Berlin, Brandenburg, Mecklenburg-Western Pomerania, Saxony-Anhalt and of the Free States of Saxony and Thuringia, all located in the east part of Germany and constituting the territory of the former German Democratic Republic (GDR), except for West Berlin. Thus, the CCR is the only cancer registry in Germany that covers several states. The population in the catchment area of the CCR is about 17.1 million inhabitants, 48.9% males and 51.1% females (2002), almost all of them being of Caucasian origin. About 59% live in urban areas (defined as population >5000 and population density >400 inhabitants per km^2).

Cancer care facilities

The territory covered by the CCR has 339 hospitals (Berlin 71, Brandenburg 47, Mecklenburg-Western Pomerania 34, Saxony-Anhalt 51, Saxony 86, Thuringia 50), most of them affiliated with a regional tumour centre. Although there are some hospitals specialising in oncology services, most of the other hospitals are involved in cancer care as well (e.g. offering special diagnostic or treatment methods). The tumour centres, however, are the focal point in cancer care. Tumour centres are specific hospitals and university hospitals specialising in diagnostics, treatment, and aftercare of cancer patients and the documentation of pertinent information. Also, general practitioners, radiotherapy departments and other specialists are involved in cancer care on an outpatient basis.

Registry structure and methods

The CCR is located in Berlin and is associated with the Senate Department for Health, the Environment and Consumer Protection (Senatsverwaltung für Gesundheit, Umwelt und Verbraucherschutz) in Berlin. The registry is funded by the contributing states according to their population size and is staffed with 1 physician, 3 mathematicians/statisticians/computer experts, 2 epidemiologists, 15 documentation or coding employees and 2 administration secretaries.

In Germany, cancer is a reportable disease. Cancer notification became mandatory in all states of the CCR (Saxony 1993, Mecklenburg-Western Pomerania 1998, Saxony-Anhalt 2000, Thuringia 2003, Berlin 2004, Brandenburg 2006). Patients are informed about the notification to the registry by the diagnosing physician.

The major sources of notification in the CCR are the regionally organised tumour centres (Tumorzentren). Tumour centres cooperate with the population-based registry in that they abstract all pertinent information from medical records of cancer cases seen in a hospital or special clinic affiliated with a tumour centre and report them to the CCR. There are about 30 tumour centres reporting to the CCR, providing >90% of all notifications per year. The remaining 10% the registry receives directly from the physician via the traditional reporting by means of notification forms. Additionally, all death certificates have been made available to the registry by local health authorities. Data of German non-residents of the CCR are exchanged with neighbouring cancer registries.

The cancer registration law from 1995 requires, for reasons of confidentiality, that all population-based registries have two independent units (in terms of space, organisation and personnel): one unit handling incoming (person identifying) notification ("Vertrauensstelle") and one unit holding the epidemiological data set and conducting the statistical analysis with the anonymised data ("Registerstelle").

Registration and quality control are performed according to the ENCR and IACR guidelines. Accuracy of the information is checked in an automated manner, in that implausible or questionable information will be identified and corrected if necessary. Annually, our data are formally evaluated on completeness by the Robert-Koch-Institute, the National Cancer Reporting Unit.

Interpreting the results

After 1989 the notification rate declined sharply due to political changes in the former GDR and the resulting lack of a legal framework for cancer registration. With the cancer registration law taking effect in 1995, the legal basis was re-established for the CCR and cancer cases were again reported to the registry. The availability of death certificates as a principal source of information on cancer cases was regulated by the cancer registration law. Since 1995, the number of reported cancer cases has steadily increased, while the percentage of DCO cases is decreasing. Note that although cancer is a reportable disease, it became mandatory only recently for some of the states of the CCR (see above).

There are opportunistic screening programmes for colorectal, prostate, cervical and female breast cancer and for skin melanoma. Data on testing for PSA are not available, but it is increasing in this population.

In the past there were some unusual occupational exposures of radon for employees in the Wismut mining area (West Saxony and East Thuringia), as well as unusual environmental exposures of radon in houses which might still be a problem in parts of this area today.

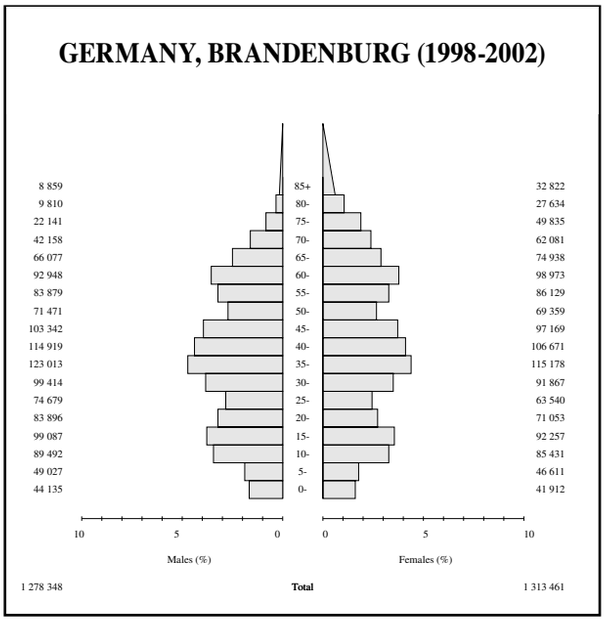
Use of the data

CCR data have been used for health services planning and for epidemiological research. Linkage with the CCR was performed for case–control and cohort studies. Annual reports on cancer incidence and mortality are published for the entire population of the CCR. In addition, state-specific reports are prepared on request. In cooperation with the association of population based cancer registries in Germany (GEKID) and the Robert-Koch-Institute, the data are pooled for nation-wide analyses.

Germany, Brandenburg

Registration area
The state of Brandenburg is one of the six states covered by the Common Cancer Registry (CCR) and is located in the North-East of Germany. The population of Brandenburg is about 2.6 million inhabitants, 49.4% males and 50.6% females (2002), almost all of them being of Caucasian origin. About 48% live in urban areas (defined as population >5000 and population density >400 inhabitants per km^2).

Cancer care facilities
In Brandenburg there are 47 hospitals, most of them affiliated with one of the regional tumour centres (see below). The state of Brandenburg has five tumour centres, located in the cities of Cottbus, Frankfurt/Oder, Neuruppin, Potsdam and Schwedt. Although there are some hospitals specialising in oncology services, most of the other hospitals are involved in cancer care as well (e.g. by offering special diagnostic or treatment methods). The tumour centres, however, are the focal point in cancer care. Tumour centres are specific hospitals and university hospitals specialising in diagnostics, treatment, and aftercare of cancer patients and the documentation of pertinent information. Also, general practitioners, radiotherapy departments and other specialists are involved in cancer care as they see cancer patients in an outpatient setting.



Registry structure and methods
For a description of the structure of the registry, please refer to the general narrative for the CCR.

In Brandenburg, cancer is a reportable disease. However, cancer notification became mandatory only recently (2006). Patients are informed about the notification to the registry by the diagnosing physician.

The major sources of notification in Brandenburg are the regionally organised tumour centres (Tumorzentren). The tumour centres abstract all pertinent information from medical records of cancer cases residing in the state of Brandenburg seen in a hospital or special clinic affiliated with a tumour centre and report them to the CCR. The tumour centres provide 99% of all notifications per year. Thus, the registry receives only 1% of the notifications directly from the physician via traditional reporting by means of notification forms. Additionally, all death certificates have been made available to the registry by local health authorities. Data on German non-residents of the CCR are exchanged with neighbouring cancer registries.

Interpreting the results
After 1989 the notification rate in Brandenburg declined sharply due to political changes in the former GDR and the resulting lack of a legal framework for cancer registration. With the cancer registration law taking effect in 1995, the legal basis for cancer registration was re-established and cancer cases were again reported to the registry. The availability of death certificates as a principal source of information on cancer cases was regulated by the cancer registration law. Since 1995, reported cancer cases from Brandenburg have been steadily increasing, while the percentage of DCO cases is decreasing. Note that although cancer is a reportable disease, it became mandatory only recently for the state of Brandenburg (see above).

There are opportunistic screening programmes for colorectal, prostate, cervical and female breast cancer and for skin melanoma. Data on testing for PSA are not available, but it is increasing in this population.

We are aware of no unusual environmental and/or occupational exposures in Brandenburg.

Use of the data
Brandenburg cancer data have been used for health services planning and for epidemiological research. Linkage with the CCR was performed for case-control and cohort studies. Annual reports on cancer incidence and mortality are prepared. In cooperation with the association of population based cancer registries in Germany (GEKID) and the Robert-Koch-Institute, the data are pooled for nation-wide analyses.

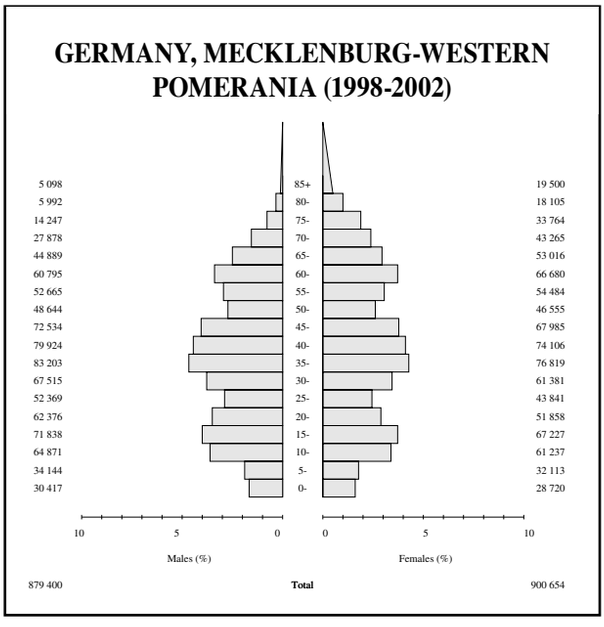
Germany, Mecklenburg-Western Pomerania

Registration area
The state of Mecklenburg-Western Pomerania is one of the six states covered by the Common Cancer Registry (CCR) and is located in the North-East of Germany. The population of Mecklenburg-Western Pomerania is about 1.8 million inhabitants, 49.5% males and 50.5% females (2002), almost all of them being of Caucasian origin. About 36% live in urban areas (defined as population >5000 and population density >400 inhabitants per km^2).

Cancer care facilities
In Mecklenburg-Western Pomerania there are 34 hospitals, most of them affiliated with one of the regional tumour centres (see below). The state of Mecklenburg-Western Pomerania has four tumour centres, located in the cities of Greifswald, Neubrandenburg, Rostock and Schwerin. Although there are some hospitals specialising in oncology services, most of the other hospitals are involved in cancer care as well (e.g. by offering special diagnostic or treatment methods). The tumour centres, however, provide a focal point in cancer care. Tumour centres are specific hospitals and university hospitals specialising in diagnostics, treatment, and aftercare of cancer patients and the documentation of pertinent information. Also, general practitioners, radiotherapy departments and other specialists are involved in cancer care, as they see cancer patients in an outpatient setting.



Registry structure and methods
For a description of the structure of the registry, please refer to the general narrative for the CCR.

In Mecklenburg-Western Pomerania, cancer is a reportable disease. In 1998, cancer notification became mandatory in this state. Patients are informed about the notification to the registry by the diagnosing physician.

The major sources of notification in Mecklenburg-Western Pomerania are the regionally organised tumour centres (Tumorzentren). The tumour centres abstract all pertinent information from medical records of cancer cases residing in the state of Mecklenburg-Western Pomerania seen in a hospital or special clinic being affiliated with a tumour centre, and report them to the CCR. The tumour centres provide 95% of all notifications per year. The remaining 5% the registry receives directly from the physician via the traditional way of reporting by means of notification forms. Additionally, all death certificates have been made available to the registry by local health authorities. Data of non-residents of the CCR are exchanged with German neighbour cancer registries.

Interpreting the results
After 1989 the notification rate in Mecklenburg-Western Pomerania declined sharply due to political changes in the former GDR and the resulting lack of a legal framework for cancer registration. With the cancer registration law taking effect in 1995, the legal basis for cancer registration was re-established and cancer cases were again reported to the registry. The availability of death certificates as a principal source of information on cancer cases was regulated by the cancer registration law. Since 1995, the number of reported cancer cases from Mecklenburg-Western Pomerania has been steadily increasing, while the percentage of DCO cases is decreasing.

There are opportunistic screening programmes for colorectal, prostate, cervical and female breast cancer and skin melanoma. Data on testing for PSA are not available but it is increasing in this population.

We are not aware of any unusual environmental and/or occupational exposures in Mecklenburg-Western Pomerania.

Use of the data
Mecklenburg-Western Pomerania cancer data have been used for health services planning and for epidemiological research. Linkage with the CCR was performed for case-control and cohort studies. Annual reports on cancer incidence and mortality are prepared. In cooperation with the association of population based cancer registries in Germany (GEKID) and the Robert-Koch-Institute, the data are pooled for nation-wide analyses.

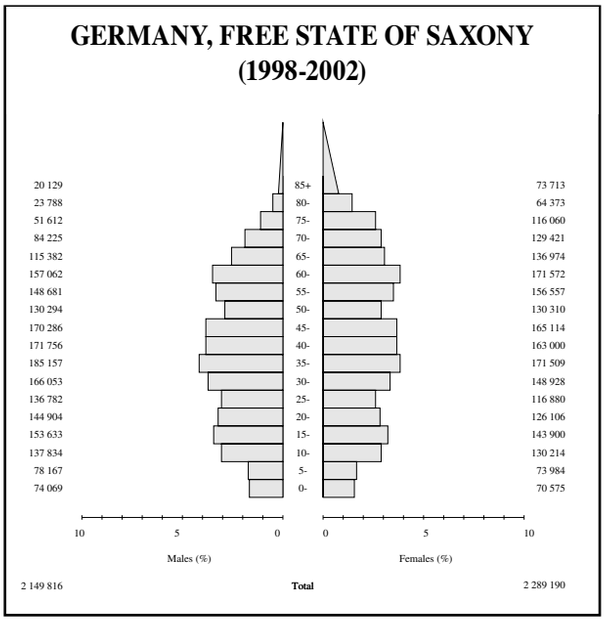
IACR rules (2004) on CI5 IX period.

Germany, Free State of Saxony

Registration area
The state of Saxony is one of the six states covered by the Common Cancer Registry (CCR) and is located in the East of Germany. The population of Saxony is about 4.4 million inhabitants, 48.5% males and 51.5% females (2002), almost all of them being of Caucasian origin. About 57% live in urban areas (defined as population >5000 and population density >400 inhabitants per km^2).

Cancer care facilities
In Saxony there are 86 hospitals, most of them affiliated with one of the regional tumour centres. The state of Saxony has five tumour centres, located in the cities of Chemnitz, Dresden, Görlitz, Leipzig, and Zwickau. Although there are some hospitals specialising in oncology services, most of the other hospitals are involved in cancer care as well (e.g. by offering special diagnostic or treatment methods). The tumour centres, however, are the focal point in cancer care. Tumour centres are specific hospitals and university hospitals specialising in diagnostics, treatment and aftercare of cancer patients and the documentation of pertinent information. Also, general practitioners, radiotherapy departments and other specialists are involved in cancer care, as they see cancer patients in an outpatient setting.



Registry structure and methods
For a description of the structure of the registry, please refer to the general narrative for the CCR.

In Saxony, cancer is a reportable disease. In 1993, cancer notification became mandatory in this state. Patients are informed about the notification to the registry by the diagnosing physician.

The major sources of notification in Saxony are the regionally organised tumour centres (Tumorzentren). The tumour centres abstract all pertinent information from medical records of cancer cases residing in the state of Saxony seen in a hospital or special clinic affiliated with a tumour centre and report them to the CCR. The tumour centres provide 93% of all notifications per year. The remaining 7% the registry receives directly from the physician via the traditional reporting by means of notification forms. Additionally, all death certificates have been made available to the registry by local health authorities. Data of German non-residents of the CCR are exchanged with neighbouring cancer registries.

Interpreting the results
After 1989 the notification rate in Saxony declined sharply due to political changes in the former GDR and the resulting lack of a legal framework for cancer registration. With the cancer registration law taking effect in 1995, the legal basis for cancer registration was re-established and cancer cases were again reported to the registry. Multiple primary rules used
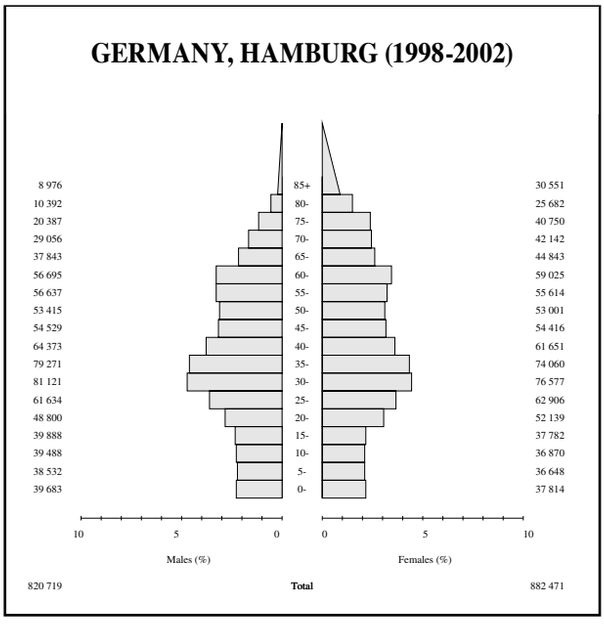
IACR rules (2004) on CI5 IX period

Germany, Hamburg

Registration area
With 1.7 million inhabitants, the Free and Hanseatic City of Hamburg is the second-largest city in Germany and one of the 16 federal states. The city area comprises 755 km², 14% of which are covered by green spaces, water and recreational areas. Hamburg is one of the world's major trade centres. Its port is the central hub for trade with Eastern and Northern Europe, supplemented by important rail and motorway connections. The predominantly urban area shows highly specialised industries, particularly medical devices, biotechnology and aircraft industry. With 11 universities, higher education is a main focus.

Cancer care facilities
Being a metropolitan area, the medical infrastructure in the city of Hamburg is above-average. Medical care is provided by a complex healthcare system including 3600 general practitioners and specialists, and 53 hospitals including a university hospital. The main institutions of specialised cancer care are about 10 hospital departments and 8 oncological practices, the latter including in- and outpatient settings. These are supplemented by numerous diagnostic, therapeutic and supporting facilities, such as laboratories, pathology units, radiology and radiotherapy institutions and psychosocial services. Up to 25% of oncological patients reside outside of Hamburg.



Registry structure and methods
Having started between 1926 and 1929, the Hamburg Cancer Registry (HCR) is one of the oldest population-based cancer registries of the world. During the Second World War the reporting process stopped, and again paused in the 1980s because of a general controversy on data protection in Germany. Since 1985 the HCR has been based on a specific law with two essential elements: the principle of informed consent from the patient and voluntary cooperation on the physician's side. Since 1991 notifications are remunerated.

The state health authority, staffed with four scientists, two computer experts and six documentation and coding employees, runs the HCR. Additional project equipment is provided by the Hamburg cancer society.

Traditionally the physicians in hospitals report by means of notification forms. Pathologists provide a partly filled notification form to be completed by the attending physician. Electronic data transmission is now realised by providing purpose-developed software to the cooperating practitioners. This software transfers data from the surgery's software into an electronic notification form completed on screen by the physician. A rising number of hospitals are supplied with facilities to enable electronic notifications as well.

In addition, all death-certificates are made available to the cancer registry staff for evaluation and trace back. The procedure of matching the HCR-data with information kept in residential registry offices was started in 2004. The step was a one-time check of 75 000 cases without date of death. Since then the update has been done monthly. Many plausibility tests are done, and a "Best-of tumour information" is generated in case of multiple notifications of a single malignancy.

Interpreting the results
Since 1995 the number of notifications to the HCR has doubled while the DCO rate has declined significantly. Completeness is independently reviewed by the Robert Koch Institute based on the M/I index, having been estimated in 2005 as sufficiently complete. Nevertheless quality differs considerably concerning site and year of diagnosis.

Although methods of early detection are used widely (e.g. Pap smear, PSA, mammography) it is impossible to quantify their numbers and to estimate their influence on incidence rates.

Use of the data
Comprehensive reports on cancer incidence and mortality in Hamburg are published every third year. In addition, in 2004 the HCR started publishing data online (www.krebsregister.hamburg.de). Routine reports cover data on incidence and mortality. In 2005 we began including survival analysis for clinical use.

In cooperation with the Association of population-based cancer registries in Germany (GEKID) and the Robert-Koch-Institute (RKI) the data are pooled and documented in *Krebs in Deutschland*.

The HCR both initiates and participates in various research projects, for instance risk factors for breast carcinoma, regional analysis of incidence concerning leukaemia and lymphoma, feedback on long-term survival to notifying institutions, acute and post-traumatic stress disorder in breast cancer patients.

One current project is the multi-centre MARIE- Study (Postmenopausal Hormone Replacement Therapy and breast cancer risk). The HCR also collaborates with the hospital planning unit of the Ministry of Health in Hamburg in the assessment of numbers of cancer cases given from the hospitals, and is involved in the evaluation of mammography screening.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

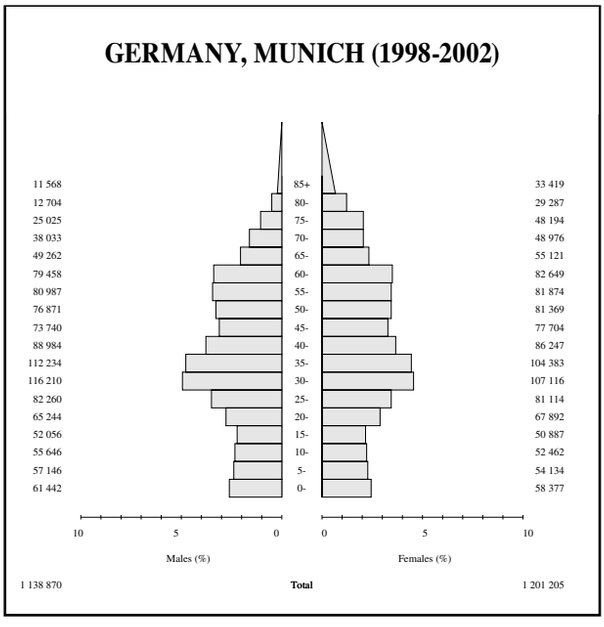
Germany, Munich

Registration area

Munich is the capital of the federal state of Bavaria, one of sixteen states of the Federal Republic of Germany (Munich City: latitude 48°8' N, longitude 11°34' E, 519m above sea level, area 310km^2). With its 1.3 million inhabitants, Munich is Germany's third-largest city, located in the southeast of the country about 50km north of the Alps.

The Munich Cancer Registry (MCR) covers the population of the City of Munich and 7 surrounding districts, in total 2.3m inhabitants, 56% living in Munich City. About 23% of the inhabitants are foreigners, 8.6% from the EU. Most of them come from Turkey (3.4%), and from Croatia, Serbia, Greece, Austria and Italy each with about 1.7%. Most work in the service and trade sector and in growth industries such as media, information and communication technology, the financial industry and biotechnology. Munich is Germany's second-largest university city.

In 1998, legislation was passed authorising population-based cancer registration in Bavaria. The registration system in Bavaria for a total of 12.4m people, based at the Munich Cancer Centre and five other comprehensive cancer centres, has been centralised to further improve the collection and processing of cancer data. Since 2007 the MCR has covered the entirety of Southern Bavaria, with 4.4m inhabitants.



Cancer care facilities

Hospitals and private practitioners provide health care in the region. There are two university hospitals in the city of Munich. All necessary diagnostic and treatment services are available to deliver healthcare according to international standards. The population-based stage distributions and treatment results show international comparability. All hospitals cooperate in the comprehensive Munich Cancer Centre.

The MCR supports networking in oncology by compiling cancer data from all sources. Presentation of individual and aggregated data is offered to the closed community of cooperating doctors.

Registry structure and methods

As part of the comprehensive Munich Cancer Centre, the MCR started registering patients in 1978. In the first years a few departments of the Ludwig-Maximilians-University and the Technical University Munich collaborated. There are now 39 hospitals in Munich, and 11 hospitals from the surrounding districts taking part in the MCR. The number of cooperating institutions and the catchment rate has reached a steady state and guarantees a high coverage rate.

Notification is on a voluntary basis, and no legal duty is imposed upon doctors to report cancer cases. Hospitals send cancer-specific forms with pre-coded data on an individual level, including identifying items for each primary malignancy. Additionally, collaborating hospitals report on local and regional progressions and on the occurrence of metastases. These data are important outcome criteria for clinicians and are used for evaluating therapeutic strategies and for quality control.

Since 1994, the 12 pathological services have been sending copies of the reports for malignant diagnoses to the MCR. The histological verification rate for almost all prognostic favourable types of cancer is 95%.

The Bavarian Cancer Registration Law allows the MCR to process all death certificates in the catchment area. Information from death certificates has been compared with registry data on an individual level since 1998. This has revealed a noteworthy underreporting for prognostically unfavourable cancer sites like pancreas, liver, gallbladder, CNS and lung. Remarkably, the age-standardised mortality rate for lung cancer in Munich is about 30% lower than the overall rate for Germany, corresponding to a high social status and low rate of smoking.

Haematological diseases are underreported. For the other cancer sites, a remarkable incidence rate could be obtained without involvement of DCO-cases and without including follow-back results. The impact on success of motivation to join the MCR can be assessed by analysing the stable incidence rate from 342.5/266.4 in 1998 to 361.7/ 271.0 in 2002 (male/female, world standard, without 174/C44).

In 2002 we handled about 29 000 pathological reports, 36 000 death certificates and 50 000 other forms and reports. Additionally, life status was verified by more than 100 000 requests at Resident's Registration Offices. This paperwork is done by 13 documentation officers. In addition three scientists are responsible for organisation, statistics and computer technology.

In Germany, cancer screening is offered but the participation rate varies widely between men and women, according to their age. Medical examination includes palpation of breast, cervical smear, haemoccult test and palpation of prostate, with a high rate of self-initiated PSA tests at the patients' own expense.

Use of the data

The MCR analyses cancer incidence and mortality concerning secular and regional aspects. Survival rates are calculated for the different cancer sites. Results are used to answer important questions, e.g. concerning quality assurance in health care. Additionally, the MCR releases periodical reports via Internet for all cooperating hospitals

to keep them permanently informed about the medical data they have provided.

Many of the most frequent cancer diagnoses are analysed in detail. Routine statistics show comparisons to the recommendations of guidelines with hints to those patients for whom the standards are not realised. The larger hospitals are informed about their own results, main outcome criteria are compared anonymously with the other hospitals. Some of the data are available for the scientific community on the internet (www.tumorregister-muenchen.de).

Source of population

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Germany, North Rhine-Westphalia: Münster

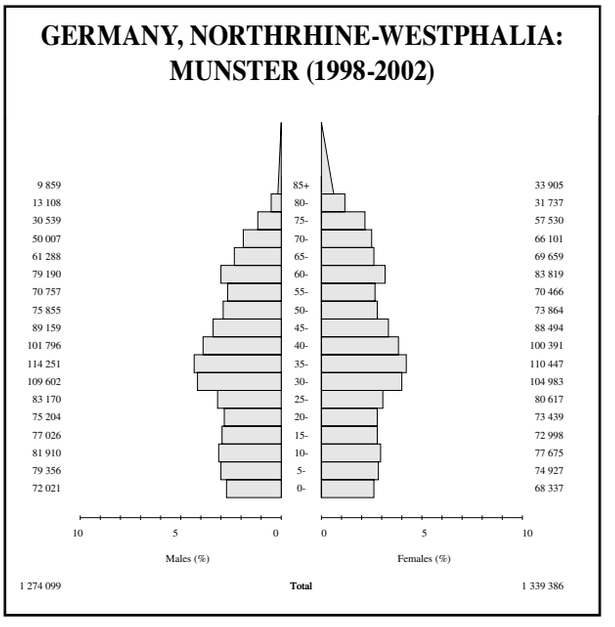
Registration area
The Muenster District (Regierungsbezirk) is a region of the Federal State of North Rhine-Westphalia (NRW). It is located in the north-west of Germany bordering the Netherlands. The population of Regierungsbezirk Muenster was 2 625 637 in 2002, with 48.8% males and 51.2% females and a population density of 379 inhabitants per km^2. The District encompasses rural areas as well as large industrial areas and cities. The great majority of the population are Caucasians. The Muenster Registry was the only cancer registry in NRW until 2005, when it was transferred into the Epidemiologisches Krebsregister Nordrhein-Westfalen, a new epidemiological cancer registry now covering the entire state of North Rhine-Westphalia.

Cancer care facilities
Cancer diagnosis and treatment in Regierungsbezirk Muenster are carried out by hospitals and specialists. There are 63 hospitals with more than 20 000 beds in the registration area. Morphological examinations and diagnoses are performed in 14 pathological institutes, one specialising in neuropathology and five in dermatohistology. Radiology services are provided by departments in numerous hospitals.

Registry structure and methods
The registry was established in 1985 and was completely funded by the State Ministry of Health. Full-time personnel comprise two senior scientists for data management and analysis, one epidemiologist, and four medical records clerks. A consultant from the Institute of Epidemiology and Social Medicine of the University of Muenster accompanies the registry.

Cancer notification requires the signed consent of patients. The sources of notification for the Muenster registry include hospitals, outpatient departments and private practitioners. Since 1998 the registry has included reports from pathologists with anonymised personal identifiers. Follow-up of patients is largely passive. Annually, the register database is linked with death certificates from the district. Follow-back is pursued if patients were initially identified in the register by death certificate.

Interpreting the results
The catchment area has remained unchanged over the reporting period. Likewise, the diagnostic and therapeutic facilities developed in line with the general medical progress in Germany. Coding has been performed according to ICD-10 and the ICD-O-3 guidelines throughout the period. No organised population-wide cancer screening programmes have been established, although opportunistic mammography, colonoscopy, skin inspection and PSA testing are rather common.



Use of the data
The registry prepares regular annual reports of cancer incidence and mortality. More detailed reports of trends and survival are prepared infrequently for specific entities (e.g. breast, leukaemia, malignant melanoma and prostate cancer). Data are also provided by an interactive database via Internet. The registry contributes frequently to the official Health Report System in North Rhine-Westphalia.

Source of population
Census.

IACR rules (2004) on CI5 IX period.

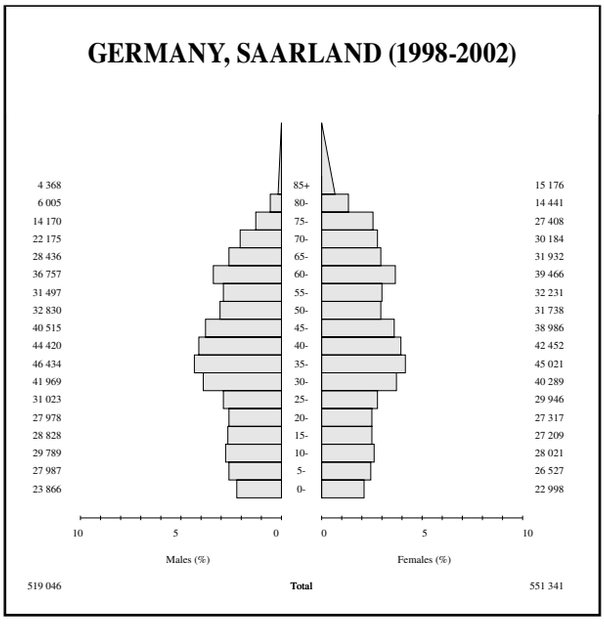
Germany, Saarland

Registration area

The Saarland Cancer Registry covers the population of the Federal State of Saarland. Located in the south-west of Germany between latitudes $49^0$38' and $49^0$07' and longitudes $6^0$21' and $7^0$24', bordering France and Luxembourg, Saarland is the second-smallest state in Germany. The area amounts to 2569 km^2 of hilly country with altitudes ranging from 150 to 695m above sea level. Saarland lies in the cooler part of the temperate zone, occupying an intermediate position between the oceanic climate in the west and the continental climate of the east. The average annual temperature is about 10^0 C. Average annual rainfall is about 1050 L/m^2.

The administrative structure consists of five counties and one metropolitan area, comprising 52 communities altogether.

The population of the Saarland is 1 070 102 (in 2000); 48.5% are males and 51.5% females, at a density of 417 inhabitants/km^2. Some 52.9% live in 13 conurbations of more than 20 000 inhabitants. Life expectancy for males is 75.0 years and 80.5 years for females. The overwhelming majority (72.7%) are Roman Catholic, with 21.7% Protestants and 5.6% with other/no religious affiliation. Of the total population, 92.5% are German and 7.5% possess foreign nationality. About 47.8% of Saarland residents are married, 36.8% unmarried and 15.4% widowed or divorced. The economically active population, 46.1% of the total, is employed in production industries (32.7%), distribution, transport and communications (23.6%), agriculture, forestry and fisheries (1.0%) and other sectors/ services (42.7%).



Cancer care facilities

Cancer treatment is carried out by both hospitals and private physicians. Treatment at the hospital level in Germany has been coordinated under a governmental programme structured on several levels. The 'Tumorzentren' (tumour centres involved in both research and treatment) cover large regions and are connected with big university hospitals. In the Saarland area there is one Tumorzentrum and one big university clinic. A series of regional hospitals dedicate considerable personnel and funds to cancer treatment. A small number of private oncological practices provide diagnostic and aftercare structures.

There are 27 hospitals with 8060 beds in the registration area. Hospitals comprise 144 special medical departments including four radiotherapeutic units. Morphological examinations and diagnoses are performed in eight pathological institutes, one specialising in neuropathology.

Registry structure and methods

The registry was established in 1967 in the State Statistical Office and is based on the Saarland Law on Cancer Registration, whose first edition came into force in 1979. A new, completely revised Saarland Law on Cancer Registration regulating and improving the use of personal data for epidemiological research, came into force in April 2002. Since April 2000 the registry has been an integrated unit of the Ministry of Public Health. Until 1999, it was financed by the Government of Saarland and by regular subsidies from the Federal Ministry of Health. Since 2000, it has been completely funded by Saarland State. Two full-time officers of health holding a university degree, two full-time registrars and three half-time clerks are affiliated with the registry.

The basic system of registration is centralised collecting of individual records including personal identifiers, which do not require the written formal consent of the registered patients. Notification is compulsory since 2002. Hospitals, physicians and persons acting on their behalf are obliged to report all newly diagnosed and treated cancer cases. In principle physicians must inform patients on the reporting to the registry, but there are some derogations. Patients have a right to withdraw from registration, but in practice withdrawal is extremely rare. Sources of information are hospitals, outpatient departments, pathology and radiotherapy departments and private practitioners. Death certificates are also used, and traced back when necessary.

Due to restrictive legal regulations, follow-up of patients is largely passive. Though all physicians treating cancer patients are generally requested to report any serious change in a patient's health status, the registry is not allowed to conduct further enquiries. The files of the registered cases are linked annually with all death certificates.

Interpreting the results

Early detection and population screening activities in Germany started in 1971. Since programme restructuring in 1982, the population has been screened for cervix, breast, rectal and skin cancer. All tests are offered annually to eligible population groups, but there was no individually organised invitation by letter with location and time of testing. To date (September 2006) there is no regular PSA testing for men in Germany. Organised mammography screening for women from 50 to 69 years of age is currently to be established in all federal states of Germany.

Use of the data

The registry prepares annual reports of cancer incidence and mortality, and provides an interactive database (www.krebsregister.saarland.de) on the Internet. The registry carries out descriptive and analytical epidemiological studies, independently and in national and international collaborations.

Source of population

Estimate based on the 1987 census, making allowance for births and deaths, as well as for migration into and out of the registration area.

Multiple primary rules used

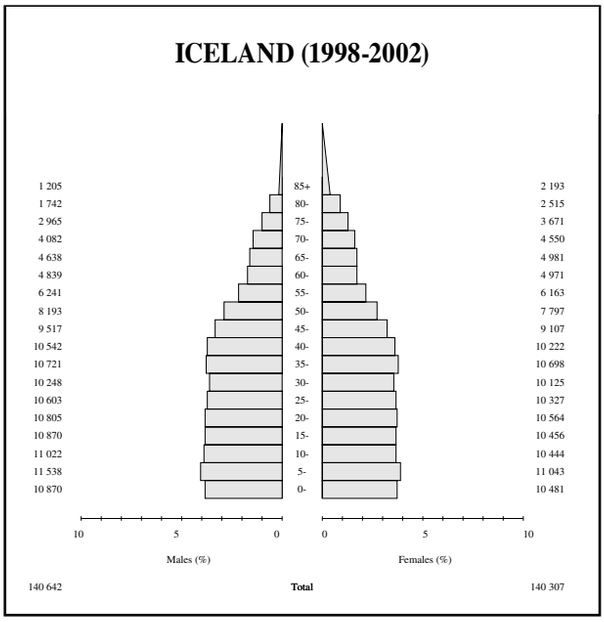
IACR rules (2004) on CI5 IX period.

Iceland

Registration area
The Icelandic Cancer Registry is a population-based nationwide cancer registry covering the whole of the Icelandic population. Iceland is located in the middle of the North Atlantic Ocean between 64°–68°N and 14°–24°W. The geographical size of the country is 103 000 km^2. The Icelandic population is around 300 000 inhabitants.

Around 80% of the population is urban, and the urban population is mostly located in the southwest part of Iceland. The population ethnicity is northern European, and the religion is Christian Protestantism for the vast majority of the population.

Cancer care facilities
Patients in Iceland have easy access to physicians, whether in primary health care or consulting in a specific field of medicine. The healthcare system is a socialised system and the proportion of the cost of the healthcare burden laid on the individual or his private insurance is minimal.



Imaging facilities are available with highly sophisticated techniques both in the major hospitals and in private practice. There are four pathology laboratories in the country, one of which is purely for dermatopathology, and all of those provide the Cancer Registry with their valuable information. There are also well-equipped haematology and biochemical laboratories as well as a cytogenetic laboratory available for various investigations of patients. Cancer surgery in Iceland is for the most part limited to two hospitals, although minor surgical operations are performed both in private offices and in smaller hospitals. Specialised work on cancer treatment like neurosurgery and radiation treatment of cancer is centralised at Landspitalinn–University Hospital in Reykjavik.

A nationwide screening programme for cervical cancer has been operating since 1964 and for breast cancer since 1987. It has been decided that Iceland shall take up nationwide colorectal cancer screening in the near future. It is quite common for men above the age of 50 to have their PSA levels measured.

Registry structure and methods
At the request of the Director General of Health the Icelandic Cancer Society undertook in 1954 to establish and run a cancer registry. It has ever since been located at and run by the Icelandic Cancer Society. In recent years the Society has received a subsidy towards the cost of running the registry from the Icelandic government. A new law was enacted in 2007 which makes cancer registration in Iceland compulsory.

The core staff consists of a medical director, a managing director, two registrars, a computer technician, a data manager and a statistician. In addition there are part-time positions for 1–2 researchers.

The sources of data for the cancer registration are the pathology and haematology laboratories, all hospital departments and healthcare facilities. Registrations are also received from private-practicing consultants. Incomplete information is followed up by contact with the aforementioned institutions and individuals. The majority of the data is received in electronic form.

The first information on cancer cases in most instances (>95%) comes from pathology laboratories. Further information is then requested from all those who are likely to give additional details if needed.

The Icelandic Cancer Registry receives information from all death certificates from Statistics Iceland, where there is a mention of a malignant disease. The registry further checks this information and additional information called for if needed.

Periodically, all registration for each site is checked and discrepancies are further investigated. The IARC check program is used.

Use of the data
Figures on incidence, prevalence and survival are published every year in the yearbook of the Icelandic Cancer Society as well as on the home page of the Icelandic Cancer Registry (www.cancerregistry.is). The registry staff is actively engaged in epidemiological research on cancer, and the registry is also the source of data for such research conducted by others. The Icelandic Cancer Registry in addition provides information to assist public health officials in planning for both the prevention and treatment of cancer.

Source of population
The population–at–risk derives from the Icelandic National Roster, in operation since 1952 and regularly updated for births, deaths and migration.

Multiple primary rules used
IACR rules (2004) on historical data.

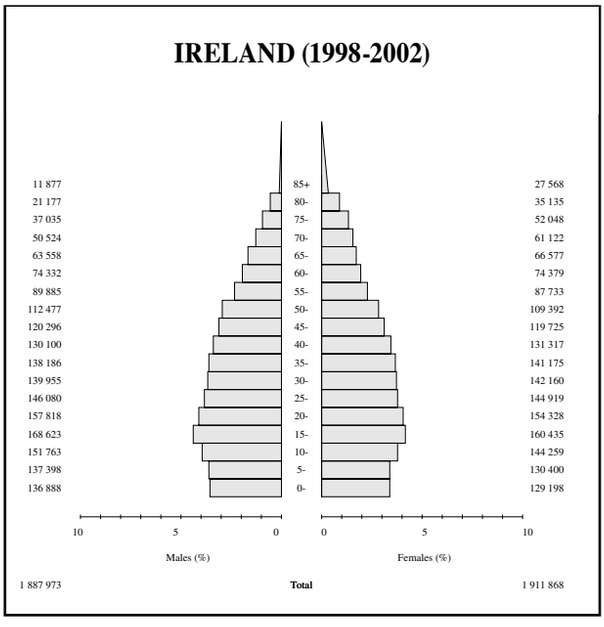
Notes on the data
C44 does not include basal cell carcinoma.

Ireland

Registration area
The catchment area of the National Cancer Registry is the Republic of Ireland. A separate registry covers Northern Ireland.

The Republic of Ireland is situated between 51°30' and 55°30' N and between 6°0' and 10°40' W. The total land area is 70 282 km^2, comprising 83% of the island of Ireland, with a long indented coastline of 3169km. The highlands are mainly coastal, with a central limestone plain, and the country does not rise above 1040m at any point. The climate is temperate and oceanic, with average winter temperatures between 4°C and 7°C, and summer temperatures between 14°C and 16°C. Yearly rainfall is highest on the mountains of the west and lowest in the east midlands.

The population at the 2002 census was 3 917 203 (1 946 164 males and 1 971 039 females). The population is predominantly native-born and Caucasian, but information on ethnicity is not collected either at census or by the Registry. Most of the population (88% at the 2002 census) are Roman Catholic. In 2002, 40% of the population lived in rural areas (centres with fewer than 1500 inhabitants).



Cancer care facilities
Cancer patients in Ireland can avail of either private or public health care. All public and private hospitals allow the Registry full access to case information. The majority of cancer patients (about 84% of incident cases) attend public hospitals. There are two main publicly-funded radiotherapy centres in Ireland, located in Dublin and Cork, and two smaller private centres both in Dublin. Almost all cancer treatment is provided within the country.

No co-ordinated screening programmes existed in Ireland in the period 1994–2000, but breast screening began in 2000 and by the end of 2002 covered approximately 50% of the population. It is hoped to have full population cover by the end of 2007. Opportunistic but unorganised cervical screening has existed for many years, but it is not possible to estimate the proportion of the population covered. In October 2000 the first phase of a national cervical screening program was established in one region of the country. PSA testing is common in the population.

Registry structure and methods
The National Cancer Registry was founded in 1991 and began collecting population-based cancer incidence data for the entire country in 1994. In 1991 it took over the functions of the Southern Tumour Registry, which had provided population-based registration for about one sixth of the country since 1975.

The Registry is administered by the National Cancer Registry Board, whose members are mainly medical practitioners, and is fully funded by the Department of Health and Children. The Registry has a staff of 42, 22 of whom are engaged in active data collection.

Reporting of cancer cases is not obligatory, and the Registry collects most of its information through active casefinding and data abstraction. Most notifications come from pathology departments, with a smaller number from other hospital sources, death certificates and GPs.

The Registry has full access to all death certificates issued in Ireland since 1994, and uses these for case-finding and follow-up. Death certificates are followed up with the hospital of death or the certifying doctor if the cancer is not already registered. Unconfirmed death certificates are registered as death certificate only (DCO). At present the Registry does not carry out active follow-up.

All data is extracted directly onto laptop computers and no paper forms are generated. The ICD-O-2 coding system is used for both topography and morphology. All malignant, *in situ* and uncertain cancers are registered, as well as benign intracranial and intraspinal cancers. CIN III of cervix is not registered on the basis of cytology, but only if confirmed by biopsy.

We have recently carried out a formal evaluation of completeness, using statistical methodology, in collaboration with Dr David Robinson of Thames Cancer Registry. Periodic checks for completeness are carried out against other cancer databases. We plan to carry out a reabstraction of a 2% sample of records next year.

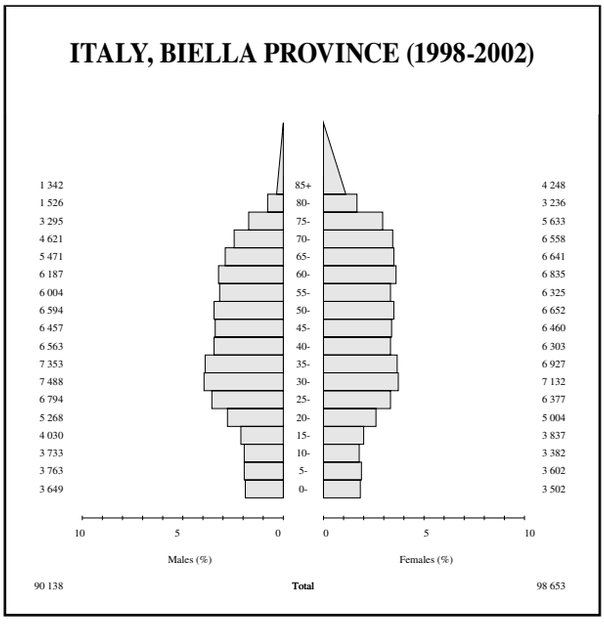
Use of the data
Annual reports, with information on incidence, mortality, treatment and survival are produced. The Registry has also published a number of scientific papers and special reports on a number of different topics, a list of which is available on the website (www.ncri.ie/pubs/pubs.shtml). The data are also widely used in the Irish health services for service planning and needs assessment.

Source of population
For 1997–2001: Population and migration estimates (Each year the Central Statistics Office (CSO) publishes an estimate of the population at April of that year. This is based on the natural increase and on estimates of the gross annual migration flows). For 2002: Census 2002.

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Biella Province

Registration Area
The Cancer Registry covers an area with 82 municipalities: 22 have fewer than 500 inhabitants and 15 have a population between 500 and 1000 inhabitants. Most of the population (187 041 inhabitants in the 2001 census) resides in urban areas (24.3%). The textile industry had always been the main activity in the area; however, during the last 20 years other electronic and metal-mechanical industries have arisen. Due to its industrial background dating back to the 19th century, this area has always been a place of immigration. In the 1950s people arrived from the Northeast of Italy (about 20% of population now aged 60–80) while in the 1970s people migrated from the south of Italy. Migrations from other countries are only recent and limited to young people (<5% of population). The birth rate is rather low (7.36 in 2001) and the elderly index high (198.95 in 2004). Nowadays, there is relative demographic stability, especially in the valleys where the communities are more isolated.



Cancer care facilities
The registry area is served by one public hospital of about 500 beds with the main surgical and medical specialities, radiotherapy, oncology and a palliative care unit, and two private clinics. Population-based screening programmes have been active since 1997 for cervical cancer, and since 1995 for breast cancer, while in the previous years screening practice was rather diffuse although opportunistic. A multi-centre evaluation trial has been carried out for colorectal cancer screening using FOBT and endoscopy since 1997. Opportunistic screenings with PSA for prostate and with clinical skin examination for melanoma were carried out with the support of the local cancer foundations for the past few years.

Registry structure and methods
The registry is part of the Centre for Cancer Prevention (CPO) of the Piedmont Region, located in the Epidemiology Unit of the Local Health Authority (ASL 12), staffed by a director, a part-time public health doctor and a registrar nurse. The registry actively searches for cases in all clinical records of local hospitals and pathology laboratories. It also actively searches for patients who migrated towards other centres, mainly in Piedmont and Lombardy, as indicated by the reports originating from the regional hospital discharge records. The registry also double-checks data with other repositories of cancer data: the Piedmont Childhood Cancer Registry, the National Malignant Bone Tumour Registry and the Mesothelioma Piedmont Cancer Registry. If case confirmation or prevalence checks are needed, the registry's staff looks up other specific files of hospital departments (radiology, radiotherapy, oncology), laboratories, the palliative care unit (active since 2000) or the hospital cancer registry (active 1959–1997). Finally, the registry regularly receives records from the local official mortality registry and has access to original documents for further checks. Completeness and accuracy of the information are formally evaluated in several ways. After data verification with the IARC-Check tools, we analyse short-term trends in number of cases, percentage contributions of each information sources, cases with poor site or histological specification, microscopic verification, prevalence of multiple primary cases, mortality incidence ratio, and proportion of DCI and DCO.

Interpreting the results
Cancer incidence in the Province of Biella is influenced by its social and industrial history, with a high incidence of larynx, lung, oesophagus and stomach cancers in men. Recently, screening programmes have made an important impact, with increasing incidence rates for breast, prostate, and rectum cancers. Clusters of cases in a particular area (mainly thyroid cancer) are presently under study.

Use of the data
The Registry reports on incidence, mortality, survival and their trends to the local and regional authorities. In addition, it reports on hospital cancer patient migration and quality of hospital records. The Registry collaborates to the evaluation of cancer care quality and to the preparation of cancer treatment guidelines. It also provides a follow-up service for clinical and epidemiological researches, and is actively involved in the following studies: the Colon-rectal screening evaluation trial (SCORE), the evaluation of prostate screening, the evaluation of implementation of colon-rectal cancer treatment (TRIPPs) in collaboration with CPO, and the prevalence of anaemia in the elderly (ANGEM) in collaboration with the Mario Negri Institute. The Registry contributes its own data to the National Database of the Italian Association of Cancer Registry (AIRTum).

Source of population
Census 2001 and Intercensual estimates: Intercensual estimates with population as of 31.12 of every year are provided by the statistical office of the Piedmont region (BBDE). The registry provides the annual median population.

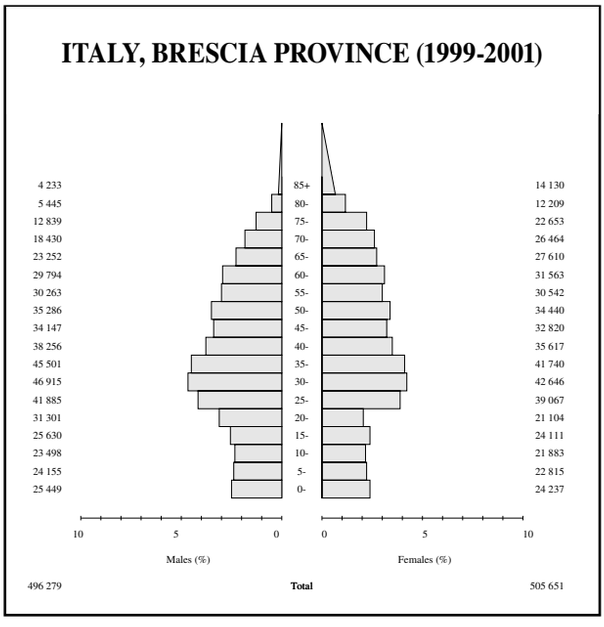
Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Brescia Province

Registration area

Brescia is one of the most densely populated provinces in the Lombardy region of northern Italy. The Brescia Health Unit Cancer Registry covers about 91% of the population of the province. Registry data are available for 1993–1995 and for 1999–2001. The Brescia Health Unit Cancer Registry started in 1994 using manual methods, and covered a smaller area with about 390 000 inhabitants, consisting of the town of Brescia and 23 surrounding municipalities. The Registry currently uses an automated population-based cancer registration system. It covers an area of 3460 km^2 at 45°N latitude. It covers Brescia (population 195 000) and 163 other smaller towns, 55 with more than 5000 inhabitants (33.7%) and 108 with fewer than 5000 inhabitants (66.3%). The population was 1 004 980 inhabitants, 51% females, at the October 2001 census. The population density is 290/km^2.

In 2001 about 8% of the population were foreigners: 30% came from East Europe and 70% from non-European countries (25% from Asia, 20% from North Africa, 20% from Sub-Saharan Africa, and 5% from South America).



Cancer care facilities

In the Registry area there are 12 public and 9 private hospitals; the largest, located in Brescia, has medical and surgical specialists and a Radiotherapy Department. The Oncology Department covers the Brescia province. In 2001 there were 3822 beds in public hospitals and 2365 in private hospitals (6.1/1000 inhabitants), and is 846 general practitioners (84.2/100 000 inhabitants). Brescia has had mammographic screening for women aged 50–69 years since the late 1980s.

Registry structure and methods

The Brescia Cancer Registry is located in the Brescia Local Health Unit (Azienda Sanitaria Locale, ASL), which provides financial support. The Registry is also funded by the non-profit Lega Italiana per la Lotta Contro i Tumori, Sezione di Brescia (Italian League Against Cancer, Brescia Division), and ASM S.p.A. (Public Utility Company). The ASL provides all the equipment and some of the human resources (4 nurses and a secretary); the two other founders support the activity of 1 medical doctor and 1 computer programmer. A medical doctor and university researcher also provide scientific support.

The Registry uses three computerised data sources: hospital discharge records provided by the Lombardy Region, pathology reports from 9 public and private laboratories, and death certificates provided by the Local Health Unit death registration office. All Italian hospitals must report each admission using a standardised form in order to receive payment. As the Regional Hospital Discharge Diagnosis Office collects all hospital discharge data from Lombardy and bordering regions, the proportion of cases missed is likely to be very small. Most pathological records are uncoded, and Registry staff code about 80% of them to ICD-O-2.

Computerised records containing all the collected data (hospital discharge records, pathological records and death certificates) are automatically linked to the Social Security System to assign a patient code to each record, and all records with that code are linked with prevalence files. Concordant incident malignant cases are assigned to the Registry. For discordant and incomplete cases, the Registry staff review the computerised information, and if any remain unresolved, they scrutinise hospital records and abstract information on cancer cases directly. For cases with death certificate notification, they trace-back and ultimately reister those that do not link with another source as death certificate only (DCO).

Completeness and accuracy of ascertainment of cases are provided through comprehensive computerised data sources and also through checking and comparison of incidence rates in previous years and with other registries in northern Italy.

Interpreting the results

Two findings from the Brescia data are high frequencies of liver cancer among men and breast cancer among women. A comparison with 1993–1995 data confirms these findings. In the last decade, epidemiological studies have been carried out to investigate the causes of liver cancer, mainly hepatocellular carcinoma, in the area; the role of hepatitis B and C viruses and of heavy alcohol intake have been elucidated. The breast cancer rate among women may be partially due to population-based mammographic screening in the area in recent years. Non-organized PSA testing concerns 12.56% of the male population (38.7% aged ≥50 years).

The Brescia province is a highly industrialised area, with one of the highest concentrations of steel and metalworking industries in Europe. Working in these factories has been associated with possible exposure to IARC class 1 and 2A carcinogens. Air pollution has been observed in the area, especially on the plain: the mean annual PM10 concentration ranged from 30–42 μ/m^3 and most daily values in the winter of 2004-2005 exceeded 75 μ/m^3.

Use of the data

The aim of the Registry is to produce and analyse incidence, mortality, prevalence and survival data according to demographic, topographic, morphological and behavioural characteristics. The Registry works alongside Regional and other Italian Cancer Registries in research projects and on publications of incidence, prevalence and survival data. A

multi-centre national study coordinated by the Director of the Brescia Health Unit Cancer Registry and funded by the Italian Ministry of Research is being conducted on the prevention of liver cancer through improved control of hepatitis B and C. A programme for the prevention and control of liver disease by general practitioners is also underway. Registry data are used routinely for monitoring population-based cancer screening programmes in the Brescia Local Health Unit.

Source of population
The resident population is estimated annually on the basis of the 1991 and 2001 censuses, taking into account births, deaths and migrations, by the National Institute of Statistics (Istituto Nazionale di Statistica – ISTAT).

Multiple primary rules used
IACR rules (1990).

Italy, Ferrara Province

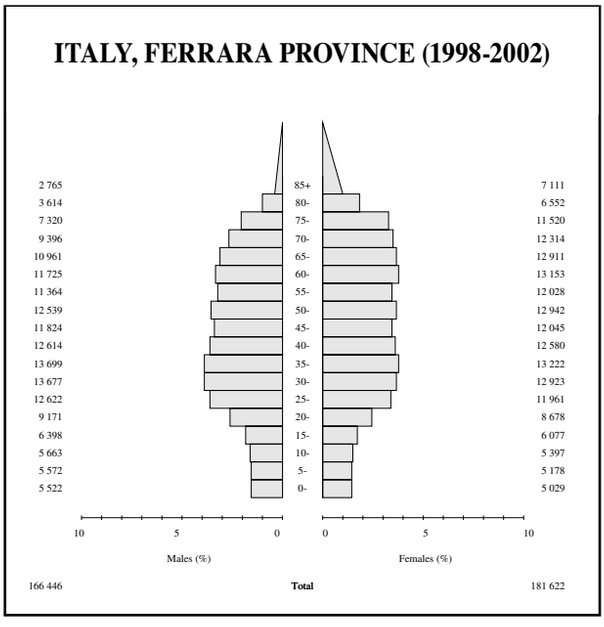
Registration area

The province of Ferrara is located in the northwest of Emilia-Romagna Region and is mainly agricultural. It lies close to sea level (maximum altitude 22m) and is bordered to the north by the Po River, to the east by the Adriatic Sea, to the south by the provinces of Bologna and Ravenna and to the west by those of Modena and Mantova.

The population (348 651 in 2000) is fairly stable, characterised by elevated aging (24% over 65 years) with a crude annual birth rate at the lowest levels in Italy (6.1/1000 inhabitants in 2000). Among the 26 municipalities of the province, the only one with a population >100 000 is Ferrara (132 085 inhabitants in 2000).

The prevalence of non-Caucasians is low, and the most widespread religion is Christian Catholic. The number of immigrants is lower than in other regional provinces, but the proportion increased in size from the late 1990s (from 0.52% in 1995 to 2.43% in 2004). A majority (54.5%) of them come from five countries (Morocco, Ukraine, Albania, Romania and Pakistan), and the female/male ratio is 1.23.

The level of employment was 47.8% (35.6% industry, 9.4% agriculture, 55.0% trade and services). Mechanical and chemical industries are present in the province, and they represent the main sources of water and air pollution, together with animal breeding, traffic, heating plants and agriculture chemical treatments. In 2000 the average temperature was 13.3°C (monthly average from –0.5°C in January to 23.8°C in August) and the overall rainfall was 443mm. In the period 1998–2002 the population showed a progressive decrease due to a fall in births and low migration rates from other areas.



Cancer care facilities

In 2000 the province had a network of three care districts with 5 general hospitals (1851 beds). These provided cancer surgery units, haematology, radiotherapy and chemotherapy services. Cervix uteri and breast cancer organised screening programmes started in 1996 and 1997 respectively as a part of a regional project. Colorectal cancer screening started in 2005. PSA testing is widespread among the adult male population, especially in recent years. In 2003, 14.6% of patients were treated outside the Registry area.

Registry structure and methods

The Registry is supported by the Emilia-Romagna regional Health Care Service since 1994, and it has also been funded by the Health Care Units of Ferrara province. Its staff of three clerks and a director is located in the Pathology Department of Ferrara University.

The main sources of information are discharge diagnoses from all national hospitals and the database of the Pathology Department (covering all pathological diagnostic activity in the province). Additional information is provided by direct contact with care services (medical records) and general practitioners. Mortality data for all causes are provided by public health services to identify DCN and DCO cases and for follow-up purposes.

Data collection is performed both actively and passively. Personal identifying data are protected in compliance with current Italian law. Regular maintenance is carried out on the computerised database. Checks for duplicates, errors and consistency are performed using the IARCcrg and DEPedits tools. Completeness and accuracy evaluations are performed using death certificates, record-linkage with pathological archives and checking of site-specific changes in incidence over time.

Interpreting the results

The high prevalence of old-aged population has a great effect on crude incidence rates of many sites. In the area covered by the Registry, lung cancer is traditionally the most common male malignant tumour. The rate of cigarette smoking in the Province (32.6% over 14 years old in 1996) is the highest in the Region (average 26.3%) and one of the highest in Italy. About 42% of children have at least one smoker parent. Air pollution from the aforementioned sources and fog also add further risk for lung cancer. Dietary risks are also remarkable, due to high meat, cold cuts and saturated fats intake, compared with low vegetable consumption. The province shows also high incidence rates for colorectal, gallbladder, soft tissue and endometrial cancers, brain tumours and multiple myeloma.

The very high incidence of breast and cervix cancer is explained by the population-based screenings started in 1996–97. Prostate and thyroid cancers also increased in the period, the former as a result of PSA diffusion, the latter of diagnostic echography improvement. DCN and "final" DCO were 1.1% and 1% respectively. The proportion of cancer deaths necropsied in 1998–2002 was low (<1%).

Use of the data

The Registry is involved in local and regional cancer care networks and it publishes periodic reports on cancer incidence, prevalence and survival. Determining the impact of screening on incidence, mortality and therapy and cancer care needs in the covered population are its main purposes. It is also involved in several studies on multiple tumours, the prognostic and predictive power of biological assessment in breast cancer, social inequalities and cancer care access.

The Registry is part of the Italian Association of Tumor Registries (AIRTum). Several studies on cancer descriptive epidemiology and breast cancer screening in Italy are now

in progress. Further activities on registration and coding techniques are also being carried out.

Source of population
1998–2002: Census and municipalities' residents files. Official regional resident population based on municipalities' files. Source: Statistics Department Regione Emilia–Romagna, Italy (http://rersas.regione.emilia–romagna.it/statexe/popol1.htm).

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Florence and Prato

Registration area
The territory of the Tuscany Cancer Registry (RTT) corresponds to two of the ten provinces of the Tuscany region, the provinces of Florence and Prato. It is situated at 44°N and 11°E. The registry covers an area of 3879 km^2, with a population of 1 162 273 inhabitants according to the 2001 census (density 300 inhabitants/km^2). The territory is divided into 52 municipalities (the municipality of Fucecchio, 21 105 inhabitants at the 2001 census, is included since 1997) collected in 3 local health units.

The only two municipalities with a population larger than 100 000 in 2001 were Prato (population 172 499) and Florence (population 356 118).

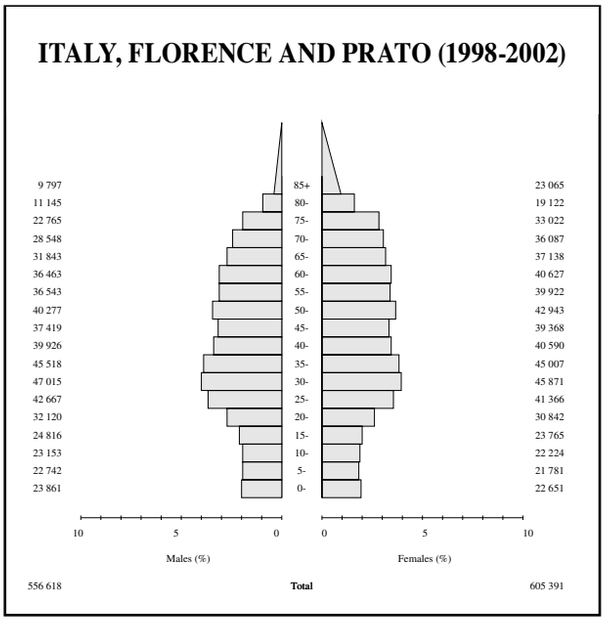
Catholicism is the prevalent religion in the area. About 4.1% of the residents (at 2001) in the area are foreign, mainly coming from Europe and Asia.

In 2001, 74.1% of the residents aged 15–64 years were employed. Industry in the provinces is concentrated mainly in the surroundings of the cities of Florence and Prato.

Since 2006 the RTT has been embedded within the regional oncological network, and the coverage of all the resident population of Tuscany (about 3 500 000 inhabitants) is ongoing.

Cancer care facilities
The registry is part of the Tuscany Cancer Institute, a network of all health services active in the Tuscany region aimed at cancer research, prevention and care.

In 2002, in the whole Tuscany region there were 14 956 beds in public hospitals and 2353 beds in private hospitals. There were 4.9 beds for every 1,000 inhabitants.



Registry structure and methods
The Tuscany Cancer Registry is associated with the Unit of Clinical and Descriptive Epidemiology of the Centre for the Study and Prevention of Cancer (CSPO) in Florence. The registry, which is commissioned and funded by the Tuscany Region Department of Health, collects, registers and analyses information related to cases of cancer in residents of the provinces of Florence and Prato. The Registry started its activity on 1 January 1985 after a one-year experimental phase to evaluate feasibility and to collect prevalent cases.

While instituted by regional law, notification is compulsory by an administrative order.

The registry receives from the Regional Health Authority copies of the official files of hospital admissions in Italian public or private hospitals (provided the latter are funded by the Public Health system), which have been abstracted from pre-coded electronic media since 1995. Copies of the autopsies and cyto-histology referrals are received from the pathology departments of the whole Tuscany region. Since 1998 pathological data have been received on computerised files.

The RTT used ICD-O-1 and ICD-O-2; all case series have now been automatically recoded into ICD-O-3. The information concerning each tumour, including personal identification and full clinic details, is coded and registered into the computer. Specific procedures and key words protect the access to the RTT files; names and other personal data and clinical information are stored on different files and, when necessary, are linked each other by an identification number.

Death certificates with personal identifiers are received from the Regional Mortality Registry, which collects and analyses for all inhabitants in the region a copy of the National Institute of Statistics mortality form. Mortality data are periodically checked against the cancer registry records to identify cases not otherwise notified.

The current staff of the registry comprises clinical epidemiologists, nurses specialising in tumour registration, biologist, statisticians and data managers.

Interpreting the results
The completeness in case collection was estimated at 97.4% during a formal evaluation carried out in 2001. Data are periodically verified according to IARC tools and specific software developed by the Italian Network of Cancer Registries (AIRTum).

Since the late 1990s screening for female breast, cervix and colorectal cancer has been active in all areas covered by the RTT. From the regional report on screening activity, the average compliance was 67% for mammographic breast cancer, 45% for cervix uteri screening and 51% for colorectal cancer screening.

In the district of Florence a cohort of more than 6800 males aged 60–74 years were included during 1991–1994 in the European Randomized Study of Screening for Prostate Cancer (ERSPC). Moreover, widespread spontaneous PSA testing is worth noting; the regional archive of diagnostic examinations in 2004 estimated that about 25% of resident men over 50 had undergone a PSA test.

In the RTT area a pilot study of lung cancer screening with low-dose computed tomography has been performed, and a randomised clinical trial named Italung-CT is ongoing.

Use of the data
The registry routinely publishes incidence and survival data and participates in clinical and analytical epidemiological studies. RTT is improving the collection of relevant clinical data for the evaluation of the diagnostic and clinical pattern. It is participating in national and international projects on cancer incidence, prevalence and survival (e.g. the Eurocare project).

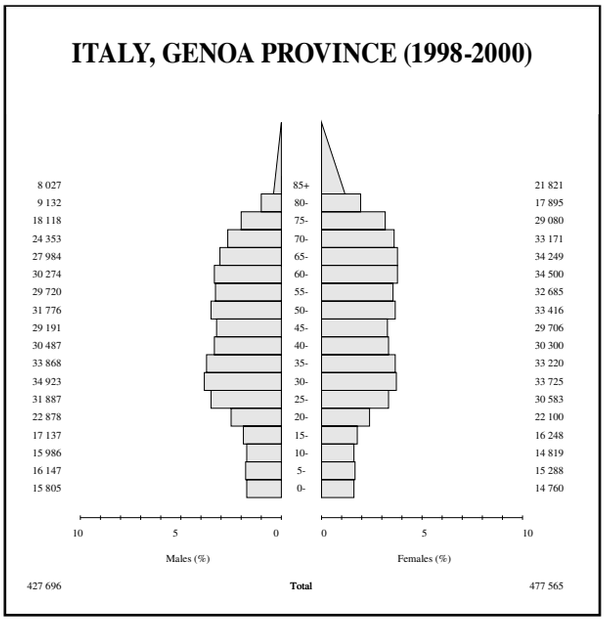
Source of population
1998–2002: Census 2001 and official intercensal estimates (ISTAT).

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Genoa Province

Registration area
The Liguria Region Cancer Registry (LRCR) covers the population of Genoa Province (1834.3 km^2) within the Liguria Region in northwestern Italy. The population (67 municipalities) at 30 June 2000 was 900 736 inhabitants (Statistical Office of the Region of Liguria). About 70% of the population lives in the urban area of Genova (632 366 inhabitants). In 2002 the Liguria Region age-adjusted death rate per 100 000 inhabitants was 1370.1, among the highest in Italy, due to the ageing of the population, the oldest in Italy; the birth rate is among the lowest, 7.3.

Cancer care facilities
Healthcare services are provided by hospitals and centres located predominantly in the city of Genoa. They consist of 17 public and 4 private hospitals providing radiotherapy, cancer surgery and chemotherapy services, and microscopic verifications supplied by five pathology services. Among the public hospitals there is also a comprehensive cancer centre, the National Cancer Research Institute (NCRI)



Registry structure and methods
The LRCR is property of the Health Councillorship of the Liguria Region and is located at the Descriptive Epidemiology Service of NCRI, which is also houses the Liguria Region Registry of Cause of Death (LRDCR). The LRCR is staffed by eight full-time researchers and one clerk: two are coders; two manage the electronic records provided by the Ligurian Health Informative System (hospital discharge records, registers of population) and the pathological records, and perform the quality control and statistical analyses; four are registrars; the clerk is mostly engaged in following the cancer cases for vital status. They are also supported by a full-time researcher and two clerks from the LRDCR, who select the certificates of causes of death of each registered case.

The LRCR registry uses active case finding from various sources of data consisting of cancer hospitals (NCRI), general hospitals (13), teaching hospitals (St. Martino and University Clinics) and pathology laboratories. The registry staff visit these sources, where they scrutinise the records kept in medical records departments, and registers of individual departments concerned with diagnosis and treatment of cancers, to identify and abstract information on cases of cancer, diagnosed by all methods, among residents of the registry region. Arrangements have been made with the hospitals outside the registration area to collect the resident cancer cases they diagnose and treat; they are consulted once a year to ask for the clinical records of these cases. As regards as the mortality data, in addition to the LRDCR source, the registry also uses official mortality data obtained through the regional organs officially connected with the National Statistics Service (ISTAT).

Interpreting the results
The LRCR collects and records data on all malignant tumours and on *in situ* carcinomas and other tumours of benign and uncertain nature of the urinary tract, brain and central nervous system; multiple primary cancers (multiple skin cancers excluded) are included as independent primary tumours. The Registry uses the IARC/IACR CHECK Program to test the validation of dataset. To conform to the Italian law regarding the care of personal data, the Registry follows an Ethical Code of Behaviour (published in their Web site and sent to all collaborating institutions and to the National Authority for Individual Data Protection), created to describe the data collection and managing procedures and the physical and electronic measures adopted to protect the Cancer Registry data bank.

A screening programme for breast cancer has been operating since 1998, organised by the NCRI on the behalf of the Region Health Councillorship and collaborating with all hospitals, pathology departments and territorial health services of the region.

Use of the data
The LRCR is involved in the planning and evaluation of health programmes in the Ligurian Region. It also collaborates with the Italian Association of Cancer Registries on joint research efforts and publication programmes devoted to describe cancer incidence, mortality, and prevalence and survival data. With the same purposes, it actively contributes to many European projects (e.g. EUROCARE, EUROPREVAL, etc) aimed at analysing data on incidence, mortality, survival and prevalence (or their determinants) in Italy and in Europe. In these latter projects, the LRCR is interested in some specific research fields: the socio-economic determinants of cancer survival, cancer in the elderly, and the equity in care resources allocation. Recently, LRCR work has aimed at producing regional and national estimates of survival in the European population by using the demographic, socio-economic and clinical (Health System organisation) characteristics of each area.

Source of population
1993–2000: ISTAT for the Province

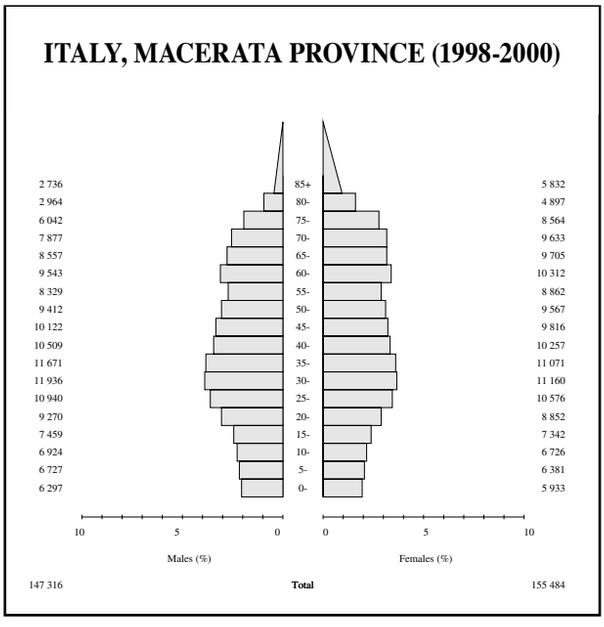
Multiple primary rules used
IACR rules (2004) on historical data

Italy, Macerata Province

Registration area
The Macerata province registry covers the population of the whole province (57 municipalities) ranging from a mountainous zone in the west to the Adriatic Sea on the east within the Marches Region, in central Italy.

The population at the recent cancer registry census (2000) was 304 443. Around 32% of the municipalities are located in the mountainous areas and have a low population density with a high proportion of people engaged in services. The 5% of municipalities situated in the coastal areas bordering the Adriatic Sea have a high number of people engaged in the industrial sector, and few in agriculture. Some 63% are located in the hill zone and can be characterised as intermediate between the other two zones.

Practically 100% of the population covered by the registry is white, with a small percentage of immigrants from China, India, Pakistan and Africa. The predominant religion is Catholic, but there are now also Muslim minorities.



Cancer care facilities
General health care in the province is provided predominantly by the three Local Health Districts (LHUs), through the district hospitals, a network of primary health centres and two pathology laboratories. This is supplemented by private practitioners and regional oncology hospitals. Each province in the region provides one radiotherapy centre. Many patients suspected to have cancer in the primary and secondary care facilities in the registry area are referred to Ancona regional hospital (40–90km distant), to Perugia regional hospital (80–130km, Umbria Region) or, occasionally to one of the cancer hospitals in northern Italy (e.g. Milano, Aviano).

Registry structure and methods
The registry (cancer and mortality) is located within the Department of Experimental Medicine and Public Health of Camerino University, and is funded partly by the Regional Health Agency. The registry is staffed by two epidemiologists and a registrar full-time; a doctor, a medical oncologist and a pathologist as consultants. The Macerata Cancer registry uses active case finding from different sources of data consisting of public and private general hospitals, pathology laboratories, radiotherapy centres, the Italian cancer registry and the death certificates from Mortality Registry of Macerata Province. This mortality registry receives copies of death certificates for all inhabitants from LHUs and a list of all deaths from the municipalities. The registry staff visit these sources and record diagnosis and treatments for every resident patient in the province. Cancer is not a notifiable disease; registration forms are not received from private practitioners. The information concerning each tumour, including personal identification and full clinical details, is coded and entered using the CanReg 4 computer program.

The accuracy of age, residential status and other demographic data are verified before records are included. The registry collects data not only on cancer incidence but also on diagnostic procedures, cancer characteristics (including stage and grade), treatment and survival. Follow-up is performed to obtain complete registration information and documentation on all cases.

Interpreting the results
Screening for breast and cervical cancer has been implemented in the province by the Sanitary Service, but the magnitude of these practices is as yet unknown. PSA is used frequently, but it is not possible to determine the proportion of the male adult population screened.

Use of the data
Information on incidence, prevalence, survival and mortality are produced and used in the LHUs and in the Regional Health Agency for service planning and needs assessment. The data are also sent to the Italian Cancer Registries' databank. The registry collaborates with some other registries in research projects and publications. Registry data are used to monitor cancer incidence and mortality in the province, as well as for health service planning and epidemiological research.

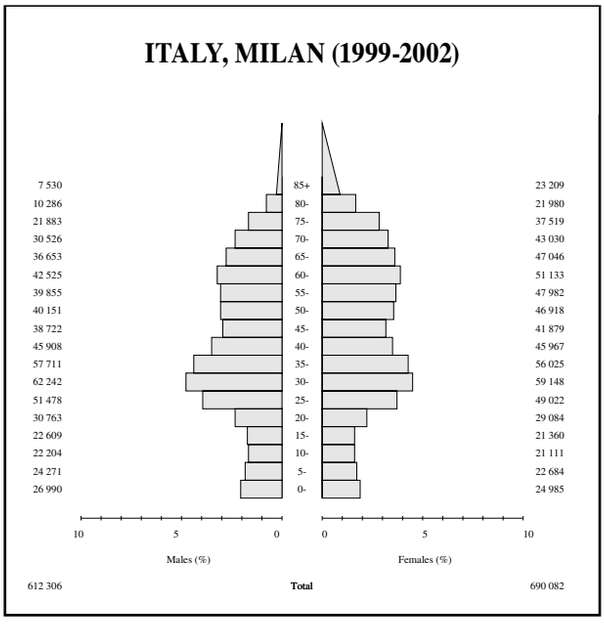
Source of population
1991 and 2000 censuses. Cancer registry personnel census the population as of 31 December of every year through the Municipalities.

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Milan

Registration area
The Milano Cancer Registry refers to the resident population of Milano, the largest metropolitan town in northern Italy (Lat. 45° 27' N; Long. 9° 10' E), covering a total area of 182 km^2. The population at the last 2001 census was 1 263 158 inhabitants with a population density of 6940/Km^2. At the last census 87 590 subjects (6.7%; 42 146 males and 45 444 females) were immigrants originating from Asia (30 116), Africa (19 481), South America (17 873) and Europe (19 950).

Cancer care facilities
A single Local Health Authority serves the population area. In the registration area there are 29 hospitals, which allow full access to case information. Among them, two research hospitals (National Cancer Institute of Milan and European Institute for Oncology) admit only oncological cases. A very small proportion of cancer cases are treated outside the Lombardy region.



Registry structure and methods
The cancer registry is located in the Epidemiology Unit of the Local Health Authority of Milano; it was established in May 2002 in adherence to the Regional Health Plan and funded by the Lombardy Region Department of Health. The registry employs three medical epidemiologists and four nurses as cancer registrars.

The registry is based on the automated cancer registration procedure (ACR) first adopted in Italy by the Venetian Tumour Registry and by the North East Cancer Surveillance Network. Accordingly, the resident population roster, death certificates, hospital/day-hospital discharges and pathology records archives are fed into the information system of the cancer registry.

The underlying cause of death and hospital admission diagnoses are coded in ICD-9. Pathology records are coded in SNOMED, and *ad hoc* transcoding algorithms from SNOMED to ICD-9 were developed and implemented. A total of 524 722 hospital/day-hospital discharges (1990–2003), 289 980 pathology records (1976–2003) and 18 295 death certificates (1999–2002), corresponding to 281 635 subjects, were considered in estimating the population incidence of cancer in the period 1999–2002.

Overall the automated procedure identified 165 614 prevalent cancer cases, 66 485 in situ/benign neoplasm; accepted 24 841 invasive cancer cases and temporarily rejected 24 695 cases. After manually resolving rejected cases, 39 404 incident cases were identified. Manually resolved cases, as well as all automatically detected genitourinary, haematological and soft tissue neoplasms, were coded with ICD-10 for topography and with ICD-O-3 for morphology. For selected cancers (including breast cancer) stage was systematically recorded.

Interpreting the results
Population-based breast cancer screening was initiated in Milano in November 1999. Furthermore, opportunistic PSA screening for prostate cancer was extensively adopted in the same period: 26.9% of male population aged 40 or older with no history of prostate cancer have received at least one PSA test in 2 years; the same rate rises to 34% for subjects older than 50 (*J Med Screen. 2002;9(4):179-80*).

Use of the data
The Milano Cancer Registry will be used to evaluate breast and colorectal cancer screening programmes. Furthermore, policymakers use registry data to evaluate healthcare and cancer treatment policies and to plan prevention activities. Considering the high proportion of immigrants, registry data will be also used to study differential cancer risks within the resident population and to plan differential preventive actions.

The registry supports etiological research. Cases are followed annually to determine survival, taking advantage of a consolidated record linkage between the registry database and the Municipal Census Office.

Source of population
Annual estimates based on the 2001 census, taking into account births, deaths and migration, were produced by the Ufficio Sistemi Statistici del Comune di Milano (Municipal Office of the National Institute of Statistics – ISTAT).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Italy, Modena Province

Registration area
The Modena Cancer Registry (MCR) covers the population of the province of Modena, which is one of the nine provinces of the Emilia-Romagna region in northern Italy. Modena borders the provinces of Bologna to the east, Lucca and Pistoia to the south, Reggio Emilia to the west and Mantua and Ferrara to the north.

The population according to the 2001 census was about 634 000 (growing by about 1% every year). Approximately 7% of all residents had emigrated from other countries (34% from northern Africa, 19% from Asia, 18% from Eastern Europe, 14% from the European Union and 11% from West Africa).

The province is divided into 47 municipalities. The only municipality with a population greater than 100 000 is Modena (about 175 000 inhabitants in 2001).

Cancer care facilities
With respect to health services, the province of Modena shows the features typical of most western countries. The area is served by 9 public general hospitals, including one university teaching hospital, and by 5 private clinics.

The university hospital also includes a Comprehensive Cancer Centre (Centro Oncologico Modenese).

Registry structure and methods
The MCR, established in 1988, is located in the Cancer Centre of the University of Modena and Reggio Emilia. It is recognised and supported by the Emilia-Romagna region, the Azienda USL of Modena and the "Angela Serra" Association for Research on Cancer.

Registry staff comprises a medical director and coordinator, a research manager, a statistician, a system manager, two registrars and a secretary.

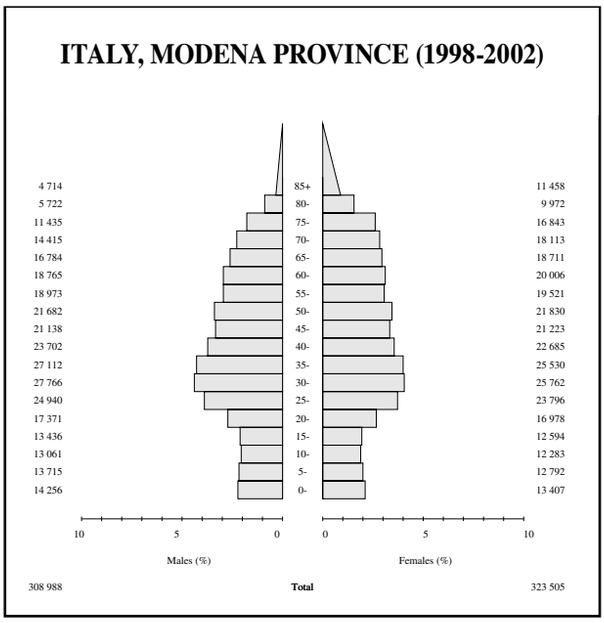
The principal data sources are the reports from the three pathology laboratories located in Modena (including one haematological laboratory), hospital discharge files and death certificates. These files are periodically sent to the registry and processed by specific software. All cases are identified and pre-coded by the computer system, and then the trained registry staff manually reviews them. Several validation checks are performed by the computer system at the time of data entry, and periodically over the whole archive.

The registry mostly carries out follow-up by matching registrations with notifications of death and with public health databases. Only non-matched patients (less than 1%) are actively followed-up by obtaining information directly from the registry offices.

All data are evaluated for completeness using IARC software and a tool developed by Modena Cancer Registry and distributed among Italian Cancer Registries that consists of more than one thousand internal checks.

Interpreting the results
Since 1994, two organised screening programmes have been offered to all women aged 24–64 and 50–69 respectively for early detection of cervical and breast cancer. The impact of cervical screening seems to be less marked because it was carried out many years earlier, but not on population basis.

It should be underlined that the increasing use of PSA testing has resulted in an increase in prostate cancer incidence rates, while the advances in diagnostic medical practices and new histological criteria seems to be related to an increasing incidence of thyroid cancer in the province of Modena.



Use of the data
The MCR produces annual reports on cancer incidence, mortality and survival, including trends and predictions of cancer incidence and survival for the coming years. The MCR is involved in many collaborative studies, such as EUROCARE studies. The registry also participates in the evaluation of breast, cervix and the recently organised colorectal screening programmes. Other areas of interest are: the investigation of local clustering of disease, estimations of future cancer incidence and survival, high-resolution studies on lymphoma and myeloma, and quality control techniques.

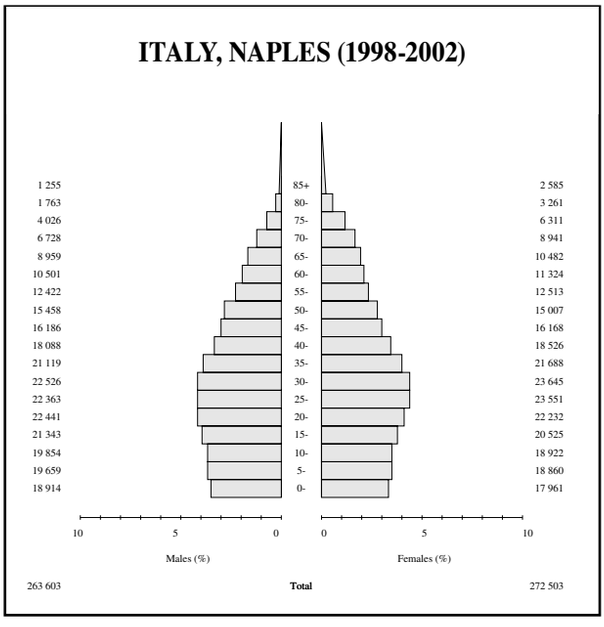
Source of population
Census 2001 and population estimates for 1998–2000 and 2002 (ISTAT).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Italy, Naples

Registration area

The Population Cancer Registry of Campania Region c/o Local Health Unit Napoli 4 (R.T.P.-A.S.L. NA4) covers an area of 499 km^2 in the northeast part of the province of Naples, in the Campania region of southern Italy (latitude 40° 47' N; longitude 14° 23'). According to the national census of 31 October 2001, the population covered by the Registry is 537 860 inhabitants (264 472 males and 273 388 females) distributed in 35 towns. In the last ten years the area covered by the Registry has been characterised by significant migration from Naples, which is the largest and most important city in the region. In fact, between the national census years of 1991 and 2001 the population of the area covered by the Registry increased by 45 000 inhabitants. In the area, which is economically depressed and characterised by high unemployment, there are a vast rural zone, an industrial pole with large and middle-sized factories, and also small-sized disorderly distributed factories.



Cancer care facilities

In the area covered by the Registry there are two public general hospitals with two chemotherapy services, one pathology laboratory and one private radiotherapy service having an agreement with the Public Health Service. The majority of resident patients who are affected by oncological diseases (about 80%) seek care in Naples, about 10km away, at the National Cancer Institute, at the two University Faculties of Medicine and at the oncology departments of other hospitals in the city. Though it is decreasing, there is still migration from the area to health services located in Northern Italy for the treatment of oncological diseases. In the same area, and over the whole Campania Region, there are also many private hospitals having an agreement with Public Health Service, in which patients affected by cancer are admitted. All patients affected by oncological diseases are exempted from bearing health participation expenses, and all patients who are admitted to hospitals abroad are previously authorised and registered by the A.S.L. NA4 offices.

Since April 1996, screening for uterine cervix carcinoma has been active over the entire Registry area, while breast cancer screening has been active since November 1998 over a limited part of the area covered by the Registry.

Registry structure and methods

The Registry is a structure of Campania Region and A.S.L. NA4; The Registry personnel is composed of a physician, specialising in oncology and epidemiology, one informatics technician and four social workers. Data collection method is active, and the sources of information are:

- Case sheets, clinical records and pathology laboratories' data, supplied by: a) National Cancer Institute of Naples, b) the two University General Hospitals, c) the Campania Region hospitals; d) the biggest private hospitals in the region;
- Regional Centre of Hospital Discharging Forms (SDO), which also provides data referring to patients who are admitted in other Italian regions;
- A.S.L. NA4 registries referring to patients who are exempted from bearing health participation expenses because of oncological diseases;
- A.S.L. NA4 records referring to admissions abroad;
- General practitioners of the area covered by the Registry (about 480) consulted for DCN cases; and
- Mortality data coded by the ASL NA4 epidemiology office.

Registry personnel have access to both the official mortality statistics and to individual death certificates mentioning cancer. Incidence cases are coded by Registry personnel. Malignant tumours included in incidence figures are defined as those for which the ICD-O-3 behaviour code is 3, and according to the IARC-IACR rules. Mortality data are coded and provided by the A.S.L. NA4 epidemiology service; they are defined as those coded in sections 140–208 of ICD-9. The software used for the registration of incidence data is CANREG-4, which is provided by IARC.

The Registry prepares periodical reports of cancer incidence, mortality and survival; moreover, it collaborates with public health services in the planning and evaluation of cancer services.

Source of population

Intercensal estimate for 1997–2000 (ISTAT), national census for 2001 and postcensal estimates for 2002 (ISTAT).

Multiple primary rules used

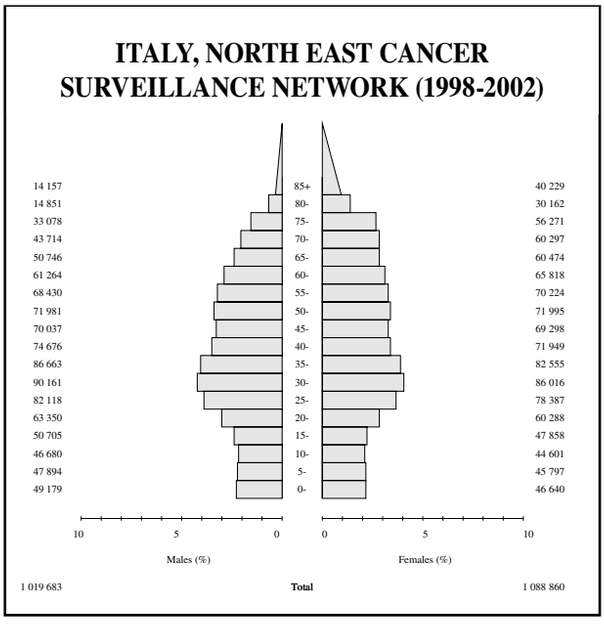
IACR rules (2000).

Italy, North East Cancer Surveillance Network

Registration area

The area covered by the North East Cancer Surveillance Network (NEICSAN) is located in northeast Italy, and is made up of three parts: the provinces of Bolzano (46°03'N, 13°14'E; 7400 km^2; 485 042 inhabitants; 65.5 inhabitants/km^2) and Trento (46°04'N, 11°08'E; 6202 km^2; 499 321 inhabitants; 80.5 inhabitants/km^2), and the whole of the Friuli Venezia Giulia region (46°03'N, 13°14'E; 6845 km^2; 1 184 000 inhabitants; 173.0 inhabitants/km^2).

The provinces of Trento and Bolzano are mostly mountainous areas, while the Friuli Venezia Giulia is a largely industrialised region bordered by the Adriatic Sea and the Padanian Valley (South), Slovenia (East) and Austria (East, North-East). Approximately 50% of the population of Trento and Bolzano and 80% of population of Friuli Venezia Giulia lives in urban areas (largest cities are Trento with 112 142 inhabitants, Bolzano with 98 657 and Trieste with 242 235). In addition to industry in the Friuli Venezia Giulia region, agriculture and tourism represent the main economical activities of the whole area, with low unemployment rates by Italian standards (between 2.7% and 6%). In the Bolzano province, 68% of the population is German-speaking.



Cancer care facilities

The territory is divided into 11 local health units of variable size, being smaller in the mountainous area. Hospital services are provided by 35 public hospitals (including one National Cancer Institute in Aviano, Friuli Venezia Giulia) and 16 private clinics. Cancer patients are generally treated at the National Cancer Institute, and in the oncology and radiotherapy departments uniformly distributed throughout the territory. A small proportion of cancer patients are also treated outside the region, including Innsbruck (Austria) for some patients from the province of Bolzano.

Registry structure and methods

The NEICSAN is a collaborative network of cancer registration in three administrative units: Azienda Sanitaria di Bolzano, Registro tumori dell'Alto Adige-Tumorregister Sud Tirol (1 director, 1 pathologist, 1 statistician/IT manager, 1 data collection officer and 5 collaborators); Agenzia Regionale della Sanità, Udine, Friuli Venezia Giulia (1 director, 1 pathologist, 1 data manager, 2 statisticians, 2 data collection officers and 5 collaborators); Azienda Provinciale per i Servizi Sanitari, Osservatorio Epidemiologico, Trento (1 director, 1 pathologist, 2 statistician/it manager, 1 data collection officer). In the Friuli Venezia Giulia region, cancer registration began in 1984 in the province of Trieste, and it has been expanded to the whole region since 1995.

The objective was to produce comparable cancer incidence estimates in a large population (about 2 150 000 inhabitants). Incidence data have been collected using the automated cancer registration (ACR) methodology, which implies availability of computerised and coded (ICD and SNOMED) diagnoses of cancer from the pathology departments, hospital archives and population offices (for population files and death certificates). The process is carried out through record linkage procedures that include analyses of computerised records, ascertainment of prevalent cases, case consolidation and quality control. Traditional cancer registration techniques based on collection of cancer forms prepared by pathologists, medical personnel in the hospitals and general practitioners are still used in the Province of Bolzano, where the ACR process has been carried out in parallel to the existing system.

For the period 1998–2002, a total of 9 461 762 records were treated by the automated process. Approximately 20% of these records concerned cancer cases, and the automated process registered nearly two thirds of incident cases. Quality controls are based on the IARC Check software: quality indicators such as the percentage of microscopically verified cases (histology and cytology), the percentage of cases known from the death certificate only (DCO) and the mortality/incidence ratio are also verified.

Interpreting the results

Several analytical studies conducted in the Friuli Venezia Giulia region have shown cancer excesses associated with personal habits and occupational exposures (namely exposure to asbestos in the shipbuilding industry). Incidence rates for the period 1998–2002 well reflect these previous findings. Changes in smoking habits in recent decades are a likely explanation for diverging trends in lung cancer rates seen in the two sexes, with a decline observed in men (from 56.3 in 1995–1997 to 49.1 in the most recent period) and a slight increase in women (from 11.3 to 12.0). PSA testing has been widely used in men for voluntary testing. Accordingly, prostate cancer turned out to be by far the most frequently diagnosed cancer in men (69.3/100.000; it was 51.6 in 1995–1997).

Use of the data

The main task of the NEICSAN is to help plan careful surveillance and preventive programmes. In addition, the registry data are used to implement population-based intervention studies (e.g. Pap smear and cervical cancer) and investigations on the causes of cancer (e.g. alcohol consumption and risk of liver cancer).

Source of population

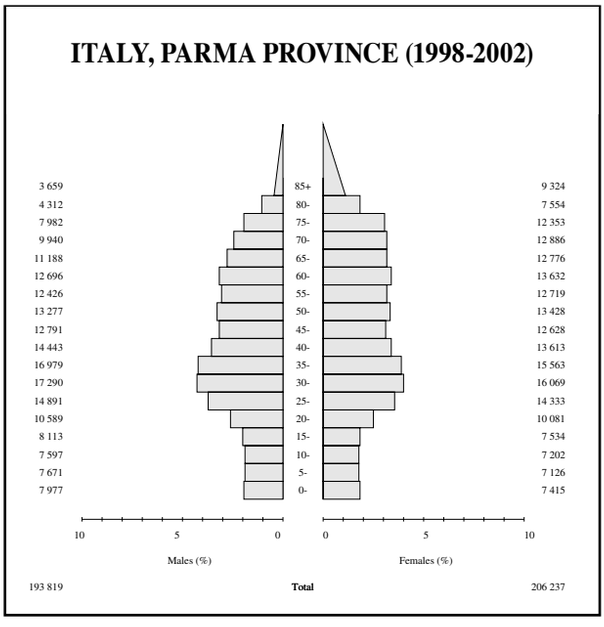
Annual estimates based on the 1991 and 2001 censuses, taking into account births, deaths and migration, produced by the Ufficio Sistemi Statistici (National Institute of Statistics, ISTAT).

Multiple primary rules used

IACR rules (2004) on historical data.

Italy, Parma Province

Registration area
On 1 January 1998 the population of the registry area was 393 963; five years later it was 404 722. This increasing trend is mainly related to foreign immigration; overall foreigners, most from North Africa, currently represent 5% of Parma residents. About 80% of the population lives in urban areas, 43% in the principal town. Local migration from the mountainous municipalities towards the city has been steady since the 1970s. In 2001 the employment rate was 74% for men and 55% for women, while unemployment was respectively 2% and 4%. The main occupational group is tertiary (59.4% of the total employed population), followed by industry (37.4) and agriculture (3.2%). The industrial sector employs workers primarily in the agro-alimentary branch (45%), followed by manufacturing (15%) and building (15%).



Cancer care facilities
The area is served by one main general university hospital, two small public hospitals and three private ones; the hospital of Parma houses a division of Medical Oncology, including a section for cytopathological diagnosis, and a radiotherapy Service.

Registry structure and methods
The PCR is located at the Medical Oncology Division of the local hospital; the staff is made up of a medical doctor as Director, a statistician as data manager, and a full-time biologist for collecting and decoding data. Information regarding new cases is obtained through examination of discharge forms from public and private hospitals (representing the first level of information for each case, independent from the hospital where each patient was treated), oncological outpatient clinics, day hospitals, death certificates, and from the two archives of pathology services. The staff has direct access to the public pathology archive; the private hospitals annually provide the registry with electronic data. For extra-provincial hospital discharges, diagnoses are detected through an official inquiry to the department's director, or consulting the patient's family doctor by written request. Patient vital status is easily updatable, since PCR has access to the computerised registry database of the Local Health Service.

Data are regularly submitted to IARC Check program. Complementary evaluations have been made to compare our data (incidence trends and crude rates, percentage of MV/Dco, relative and observed survival rates) with those of neighbouring registries, and to examine the main features of special sub-areas of Parma Province (urban/rural area, altimetric zone, health service districts, etc.).

Interpreting the results
Two screening services began to operate in the area of registration: the population aged 50–69 has been screened for breast cancer since 1997 and the population aged 24–67 for cervical cancer since 1998. Some recent, increasing trends of incidence—breast and prostate cancer—reflect the diffusion of early diagnosis due to voluntary screening and asymptomatic forms through PSA testing. Trends in melanoma can be interpreted as being related to previous underestimation. M/I ratio offers an encouraging sign of the level of completeness obtained for each site. PCR continues to integrate and correct data previously collected.

Use of the data
Study data are aimed on one hand to promote the comparison of data and collaborative studies with other Cancer Registries, and on the other to support Health Services programming by estimating and quantifying the cancer burden.

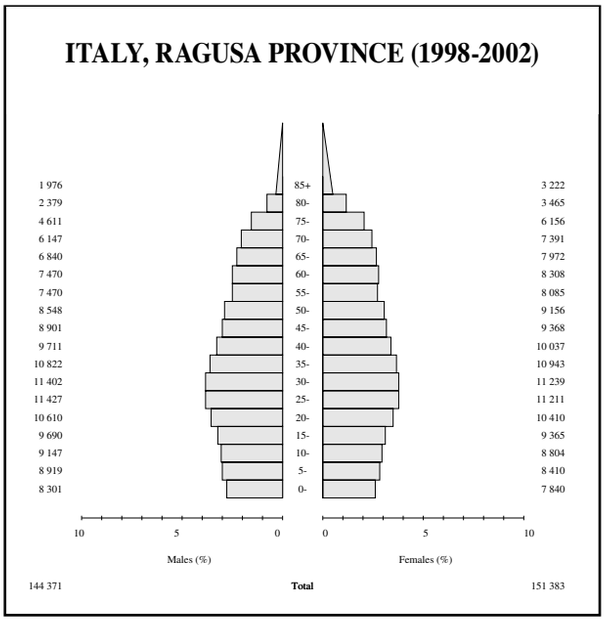
Source of population
Estimates (ISTAT http://www.istat.it).

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Ragusa Province

Registration area
The Ragusa Cancer Registry (RCR) covers the population of the province of Ragusa in southeast Sicily (Italy). At the 2001 census the population was 295 264 (5650 of whom were migrants, mainly from North Africa) living in small to medium-sized municipalities: the largest is Ragusa city, with 68 000 inhabitants; 9 cities consist of 8000 to 50 000 inhabitants, and in two villages the population accounts for 3000 people. Almost all people are white and Catholic; about 20% of the working population is involved in agricultural occupations (mainly farming and cattle).

Cancer care facilities
The local health system is arranged in one Main Hospital (Azienda Ospedaliera "Civile M.P.Arezzo", Ragusa), one Local Health Authority (AUSL 7) that includes one private and 4 small public hospitals, and 350 general practitioners. There are two histopathological units, one oncological department and one radiotherapy unit; all of the public radiological departments have CT facilities, and the main public hospital provides MRI exams. All of the 7 surgical units of the local hospitals provide cancer surgery. A district-based breast cancer screening programme was established in 1995, covering half of the province's female population aged 50–69 years.



Registry structure and methods
RCR is part of the Oncological department of the main hospital (Azienda Ospedaliera "Civile M.P.Arezzo", Ragusa). It is funded by the hospital itself and the Sicilian Government. The staff consists of a half-time medical doctor pathologist (director), two full-time social workers, and 12 part-time collaborators. Cancer registration is essentially an active process by means of field workers who abstract the required information from hospital admission/discharge files and clinical notes; case finding is also performed at pathology laboratories, radiotherapy units, oncological outpatient clinics and the local private TC centre (CITC srl Ragusa); a notable source of cases are the administrative offices that deal with cancer patients' needs (i.e. exemption from cancer care and diagnostic charges). The local vital statistics and death registration offices provide RCR with all death certificates where cancer is mentioned. Municipal registers are involved for validation of the identity and residential data of each registered case, and checking vital status.

Ragusa Cancer Registry is carrying on a linkage study in order to evaluate the completeness of registration by comparing the records already detected from clinical notes with the Sicilian computerised hospital discharge recording system; the latter is an independent source of data that includes all hospital discharges of all of the patients resident in Ragusa province who were admitted in any Italian hospital.

Interpreting the results
Cancer occurrence in Ragusa province has been slightly increasing in the last ten years, but this area is still at a lower cancer risk in comparison to other registries from western countries. This is mainly attributable to Mediterranean dietary habits and to a lesser extent to the un-polluted environment. Despite this low risk, the 5-year relative survival ranks among the lowest in comparison to North European cancer registries; this low survival seems to be related to an advanced stage of the tumour at diagnosis.

The main change in the period 1998–2002 that may have affected cancer registration was the settlement of the radiotherapy unit and public CT facilities: this has made it possible to retrieve core cancer data like anatomic site, histological reports and stage at a more detailed level.

PSA testing has become more common since 2000, and prostate needle-biopsies have been increasing from year 2001 according to the data of the local surgical pathological laboratories; these practices may have slightly affected the local prostate cancer occurrence in the period 1998–2002.

Use of the data
Data are sent to the Italian Association of Cancer Registry, which publishes periodical national reports including specific tables of RCR. RCR is a collaborating centre for the European Prospective Investigation into Cancer and Nutrition (the EPIC study), and a partner and member of the EUROCARE and EUROCHIP studies and the EU-funded research EPIC-ELDERLY, the EU integrated project INTERACT and EU-coordinated action HECTOR. RCR data have been used for evaluation of the local breast cancer screening programme (the Italian IMPACT study).

Source of population
Intercensus estimate by Italian Institute of statistics (ISTAT) for 1992–2000, census for 2001, intercensus estimate by Italian Institute of Statistics for 2002.

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Reggio Emilia Province

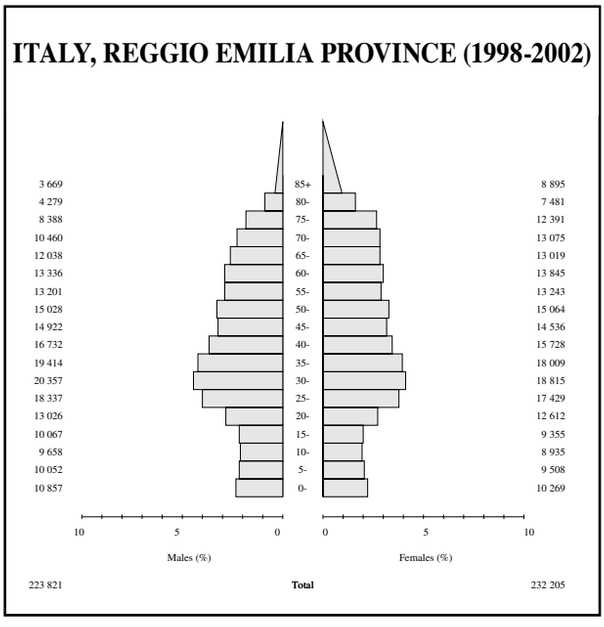
Registration area
The Reggio Emilia Cancer Registry (RECR) covers the population of Reggio Emilia Province in the centre of the Emilia-Romagna Region, in north Italy. Reggio Emilia is characterised by an interesting and varied landscape that ranges from the vast plain in the North, where the main Italian river (Po) flows, to the Apennine Mountains in the South, which reach a height of 2150 meters.

The territory is divided into 45 municipalities, the principal one being Reggio Emilia, which accounts for more than 142 000 inhabitants.

The total population at the end of 2003 was 477 534; foreign residents represented 6.4%. The most common foreign groups came from North Africa, Eastern Europe and Central-South Asia.

Reggio Emilia is a highly industrialised area: the principal industries are mechanical and ceramics production, although agriculture is also present.

Until the late 1980s, some of the most important Italian asbestos cement factories were in this province, although the number of workers employed there was limited.



Cancer care facilities
Public healthcare is provided by the territorial-based Azienda USL and the Arcispedale Santa Maria Nuova (ASMN) hospital. The Azienda USL is divided into 6 healthcare districts, each with its own hospital. The ASMN includes several healthcare facilities: oncology and radiotherapy departments (both since the 1970s), digestive endoscopy, dermatology and pathology departments. In each healthcare district there is a medical oncology unit.

At present, there are three working screening programmes in the province of Reggio Emilia: for breast and cervix cancers (since 1994) and for colorectal cancer (since 2005).

Registry structure and methods
The RECR is recognised and financed by the Emilia-Romagna Region.

The registry is physically located at the Unit of Epidemiology of the Department of Public Health.

The staff is composed of an oncologist as director, three biologists as data collectors, one statistician and one healthcare planning administrator.

The purpose of the registry, since its founding in 2001, has been to collect cancer incidence and survival for the target population, to promote 'ad hoc' studies and to collaborate with studies organised by other institutions. These activities contribute both to producing scientific reports and publication and to improving cancer prevention and control in the province of Reggio Emilia.

The main sources of information are: the files of the two pathology services, hospital discharge records and death certificates. Site-specific cancer registry information (i.e. mesothelioma, melanoma, breast and cervix) is also used to improve the accuracy of RECR data.

At the end of each incidence year, data are checked using IARCcrgTools. Other checks are also performed to evaluate data completeness and validity (mortality incidence ratio, the proportions of DCO, cases with morphological confirmation, and unknown cases). When data have been processed, incidence trends are analysed.

Interpreting the results
Population-based breast and cervical cancer screening programmes might influence the incidence rates. It should also be underlined that increasing use of PSA testing most likely caused an artificial rise in the incidence of prostate cancer.

Use of the data
The registry publishes data periodically on incidence, mortality and survival. The RECR is involved in several in-house and collaborative studies. These cover many fields: from epidemiological studies to clinical research, public health surveillance and social inequality studies.

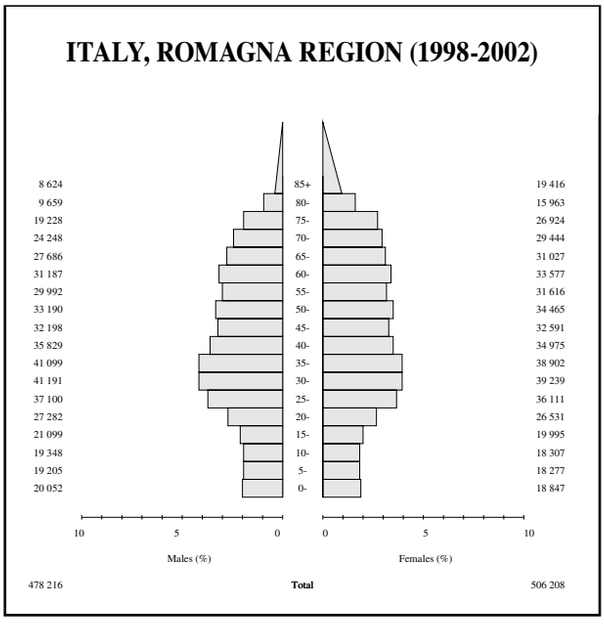
Source of population
Census 2001 and population estimates for 1998–2000 and 2002 (National Institute of Statistics, ISTAT).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Italy, Romagna Region

Registration area

The area covered by the Romagna Cancer Registry is part of the Emilia-Romagna region situated in the northeast of Italy. The Romagna region extends from the Adriatic Sea in the east to the borders of the provinces of Bologna in the west, Ferrara in the north, Florence and Pesaro in the south. The population is fairly stable. Among residents, the prevalence of non-Caucasians as well as of foreigners is low. The Romagna region amounts to 4769 km². The south of the region (48% of the total surface) is hilly and sparsely populated. The area is subdivided into three provinces (Ravenna, Forlì-Cesena and Rimini) with a total of 68 municipalities. The population density is 158/km² in the Province of Forlì-Cesena, 199/km² in the Province of Ravenna and 544/km² in the Province of Rimini. The area is socioeconomically homogeneous. The proportion of adults employed is 59.9–60.5% for men and 40.5–42.9% for women. The industrial and agricultural sectors employ 29.6% and 7.5% of the active population, respectively.



Cancer care facilities

The Romagna region has 13 public (National Health Service) hospitals and 15 certified private hospitals. The total number of hospital beds is 5163 (or 5.2 per 1000 residents) with 221 821 annual discharges. The number of general practitioners is 836 (0.84 per 1000 adult residents). Cancer care facilities in the area include medical oncology departments and centres for early detection of cancer at the hospitals of Ravenna, Forlì, Faenza, Lugo, Cesena, Rimini and Riccione. The hospital-based oncology departments in the three provinces of Romagna (Forlì-Cesena, Ravenna and Rimini), offering a total of 168 beds (87 inpatient and 81 outpatient), have long been working towards a greater understanding of all aspects of the cancer problem, with the final aim of improving the quality of health care and patient management. The Cancer Institute of Romagna (*Istituto Scientifico Romagnolo per lo Studio e la Cura dei Tumori* [IRST]) has recently been established to further enhance the already high-quality health care for cancer patients of the region and to become a cancer centre of excellence for central Italy. Part of the institute's mission is to take in hand the fundamental research programmes and activities that the public health sector cannot cope with.

Registry structure and methods

The Romagna Cancer Registry was funded by the Istituto Oncologico Romagnolo until 1995, and has been supported by the Government of the Emilia-Romagna Region since 1995. The major information sources for the Romagna Cancer Registry are the archives of histology and cytology reports, hospital discharge forms, outpatient records of the medical oncology departments, the archives of private clinics, and death certificates obtained from the departments of public health of local health care districts. The registry is staffed by an epidemiologist, two statisticians, and 12 data managers.

Interpreting the results

Between 1996 and 1997, population-based screening programmes for breast cancer and cervical cancer were progressively implemented in each of the four health care districts of Romagna. In 2005, a screening programme for colorectal cancer was also launched.

Use of the data

Incidence data from the Romagna Cancer Registry are published through the IARC, the Health Department of the Emilia-Romagna Region, and the Italian Association of Cancer Registry (AIRTum). The registry participates in many research projects coordinated by the AIRTum. The active contribution of the registry to local cancer control strategies includes situation analyses (studies of the patterns of stage, diagnosis and treatment of major malignancies) as well as cervical and breast cancer screening monitoring. The registry database has been used for several cohort and case–control studies. Most of these have addressed the relationship between diet and digestive tumours, diet and breast cancer, pesticides and haematopoietic malignancies. Others have evaluated the risk of breast cancer for women bearing breast cysts and the risk of colorectal cancer for subjects undergoing polypectomy. The registry participates in the planning, conduct and analysis of numerous studies aimed at validation of diagnostic techniques and evaluation of health services.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Italy, Salerno Province

Registration area
The Salerno Cancer Registry (SCR) covers the population of the whole Province of Salerno. It is the largest province in the Campania Region, consisting of 158 municipalities. The province of Salerno extends from the Tyrrhenian Sea in the west, to the borders of the provinces of Napoli and Avellino in the north and Potenza in the southeast. The vast area of Salerno has a varied territory, divided into inland hills (that cover 45% of its total area), mountains (29%) and coastal hills (15%), while only 11% is covered by plains.

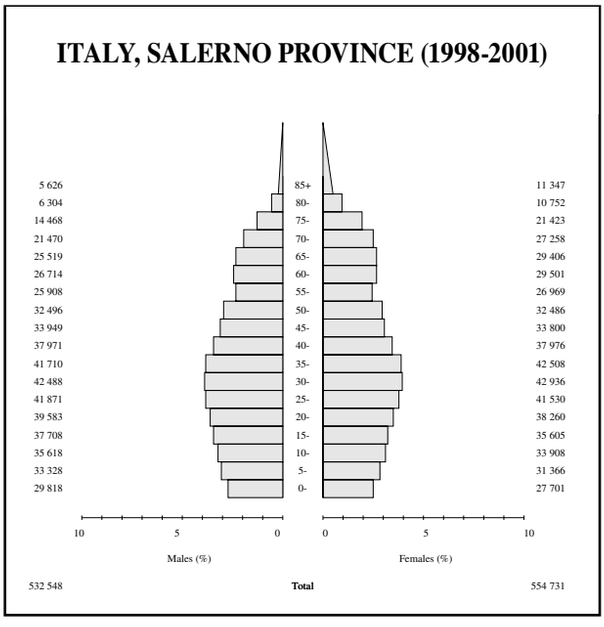
Salerno is characterised by a densely populated urban area with a number of industrial activities in the north and by a wide rural area in the south. Coastal settlements and mountain villages are found in the west and in the east respectively.

Registry structure and methods
The registry is supported by the local administration (Provincia di Salerno) and is staffed by a Director, a data collection coordinator, an IT manager, two full-time registrars and five part-time workers.

Almost all sources of information (pathology reports, hospital discharge forms and death certificates) come from electronic media, but they are processed by registry personnel without any automated coding. Compared with the cancer registries of northern Italy, a higher proportion of patients are likely to be diagnosed and treated in hospitals located outside the province of Salerno. In order to assure the completeness of the data, the staff of SCR actively collects hospital discharges and pathology files from these hospitals.

A huge population data file allows us to prevent double registrations. Follow-up status is periodically updated, and this procedure consists of annual linkage with the mortality registry and by active research for vital status in the registry offices.

Interpreting the results
Incidence rates are influenced by a probable risk gradient between the urban north and the rural south. In the north some areas are also potentially affected by water pollution due to past industrial contaminations. A population-based screening programme for breast cancer was implemented only few years ago; we expect that it will affect breast cancer incidence and mortality rates only in the future.



Use of the data
Reports on incidence, mortality and survival are periodically provided by the Salerno Cancer Registry to general practitioners, public health professionals and epidemiologists. Specific and collaborative studies on survival, dietary and other risk factors are in progress.

Source of population
Census 2001 and population estimates for 1998–2000 (Istituto Nazionale di Statistica – ISTAT).

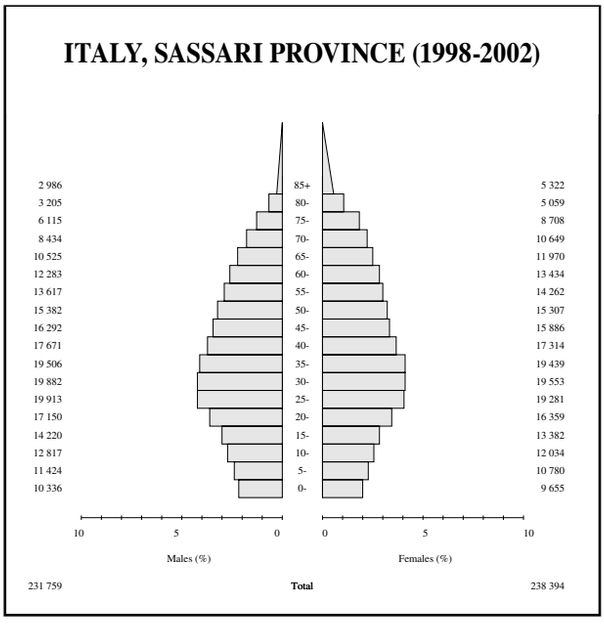
Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Sassari Province

Registration area
The Sassari cancer registry covers the population of Sassari province in the Mediterranean island of Sardinia (Italy). The population at the most recent census (2001) was 453 628. Between 1991 and 2001 there was a small population decrease of about 0.3% (1276 persons); nevertheless in the previous decade there was an increase of about 4.5% (20 286 persons).

The province covers 7520 km^2 and has a population density of 60 persons/km^2, nearly 1/3 of the national population density. The population is not evenly distributed across the land; the provincial chief town has 128 000 inhabitants; three towns have 30 000–40 000 inhabitants, three towns have 10 000 inhabitants and all the other people live in 83 small villages.

With few exceptions, the population is of the same race and the same culture. The economic activities are mostly agriculture and tourism. In the north of the area there are also two harbours for trade and one cracking plant.



Cancer care facilities
The National Health Service provides general health care through 1 regional and 4 district hospitals and primary health centres. Private practitioners supplement this.

The oncology department is located in the regional hospital in Sassari, and provides facilities for diagnosis, PSA testing as a routine procedure for elderly people, cancer surgery, and chemotherapy services.

Patients suspected to have cancer in the primary and secondary care facilities are mostly referred to district or regional hospitals. Usually patients are referred to district hospitals, but can also use hospitals in other provinces or outside of the island.

Registry structure and methods
The registry is a result of the work in partnership between the Epidemiology Service of Azienda Sanitaria of Sassari and the Anatomy and Histopathology Institute of Sassari University. It is funded by Azienda Sanitaria and is located in the Epidemiology Service. Four epidemiologists and two health workers staff the registry.

The registry collaborates in research with the institute of Anatomy and Histopathology Institute of Sassari University and the genetics OU of the CNR in order to define the prevalence of some genetic markers (BRCA, BRAF) and their influence on the prognosis of tumours.

The Sassari Cancer Registry (SCR) has collected, starting from 1 January 1992, all cases of malignant tumours occurring in the Sassari province. Particularly, all tumours listed in sections 140-208 of the ICD-9 and in sections C00–C97 of the ICD-10; intracranial and spinal neoplasms, malignant and benign; *in situ* carcinomas are normally collected but not utilised to calculate incidence, except urinary bladder carcinoma. The cases with insufficient detail are considered just when evidence is clear or when a tumour diagnosis is found on the death certificate.

The variables collected are: health unit to which patients belong, name, place and date of birth, sex, marital status, address, occupation or social class, attending physician, hospital and department of admission, site of tumour, presence of tumour in other family member, basis of diagnosis, grading, extension (or TNM) of neoplasm, leading treatment, causes of death, and place and date of death.

The registry receives the list of all persons admitted to Sassari Hospital and the list of biopsies. In addition, we use active casefinding in two regional hospitals (Sassari and Nuoro), in five district hospitals, in all medical offices for oncology and in the death registration offices.

Registry staff visit these sources periodically, and scrutinise the medical records of departments concerned with diagnosis and treatment of cancer, to identify and abstract information on cases of cancer, diagnosed by all methods, among residents of the registry area. Cancer is not a reportable disease, and the registry does not receive information about cancer cases from private practitioners. Arrangements have been made with the hospitals outside the region to notify the cancer cases in Sassari residents that are diagnosed or treated in their area.

In order to verify the completeness of the registry, the mortality/incidence ratio and DCO percentage are calculated annually, and the list is linked with that of the hospital's inpatient records and biopsies.

Interpreting the results
In the registry area, hospitals and diagnostic facilities are adequate in number and well distributed in the territory, so that it is unlikely that cases referred will be missed. Also, ASL operates a screening service for breast cancer and cervical cancer.

Use of the data
The registry prepares an annual report of cancer incidence highlighting changes and peculiar tumours (e.g. Kaposi sarcoma, chronic myeloid leukaemia, chronic lymphatic leukaemia), and points out the registered cancer cases survival after five years from registration.

The data of the registry have been used from the regional government to define cancer-control plans.

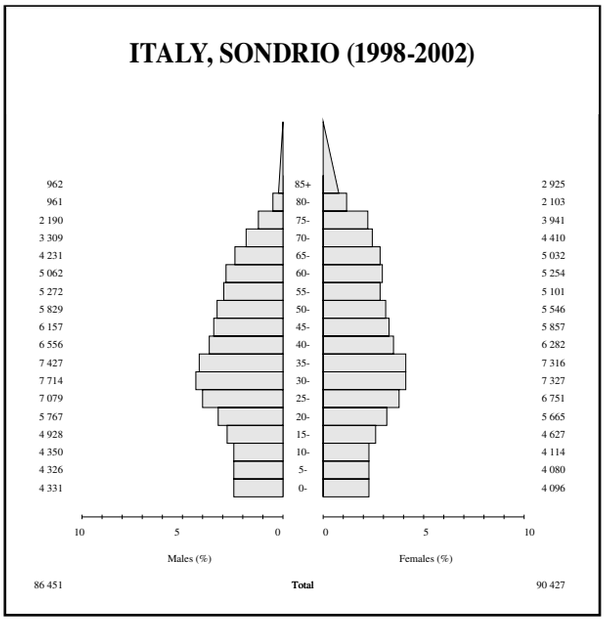
Source of population
1992–2002: Intercensal estimates (based on the 1991 and 2001 census data, making allowance for births, deaths and migration into and out of the province).

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Sondrio

Registration area
The Sondrio Registry covers the population of the district of Sondrio in Northern Italy. It is a predominantly mountainous district, but about 68% of the population lives under 600m above sea level, 18% from 600–1000m and the remainder over 1000m. The main city is Sondrio, with 23 000 inhabitants. The greater part of the population lives in rural areas or small towns with <5000 inhabitants. The population is Caucasian (99.8%), and predominantly Christian. Women (51.1%) have longer life expectancy (median age of death for males is 74 years; for females, 84 years). In the district of Sondrio a small proportion of immigrants (1.4%) were registered in the national census of 2001.

Cancer care facilities
The public health services department, through 4 public hospitals and a network of primary health centres, provides general health care in the region. Hospitals provide cancer surgery, thoracic surgery, neurosurgery, haematology, radiotherapy and chemotherapy services and imaging services (4 CAT scan, 2 NMR). About 15% of patients with cancer are referred to secondary care in hospitals in Milano (120km distant).



Registry structure and methods
The registry is located within the Public Health Department, which provides physical and financial support. The registry is staffed by a full-time medical doctor (epidemiological specialist), a full-time nurse (registrar), and a part-time informatics specialist. The Istituto Nazionale per la cura dei Tumori of Milano (INT) provides technical and epidemiological support.

The registry receives all Italian Hospital Discharge Data of inhabitants in the area of the registry, databases of pathology laboratories in Sondrio and Milano area and mortality databases (pre-coded data). The registry scrutinises the records with cancer diagnosis or treatment and recodes all cancer cases. The staff scrutinises registers of radiotherapy and chemotherapy services and of hospitals when cases are uncertain.

If DCO (Death Certificate Only) cases are detected, the registry interviews the practitioner. Quality control, i.e. evaluation of DCO, of percentage of microscopically verified cases, of mortality/incidence ratio, of time trends, external comparison with Italian Registries, and capture-recapture analysis with independent databases (the Registry of Mesotheliomas, Italian Association of Paediatric Oncologists), are carried out with INT. The registry began the registration of incident cases in 1998 and has collected 6600 prevalent cases (with incidence date before 1998).

Interpreting the results
The population within the area is stable, and there have been no changes in the availability of diagnostic and treatment services or in definition and coding.

Screening for breast cancer by mammography has been active since 2000; screening for melanoma has been offered since 1999. The number of PSA tests is increasing; in 2004 there were 16 000. In the past many workers have been exposed to siliceous powder, and in 2004, the prevalence of silicosis was 800 cases.

Use of the data
The registry prepares an annual report of cancer incidence and survival. The data are used for evaluation of health services (for example migration of patients, terminal care). Some special studies on therapy for breast cancer have been carried out.

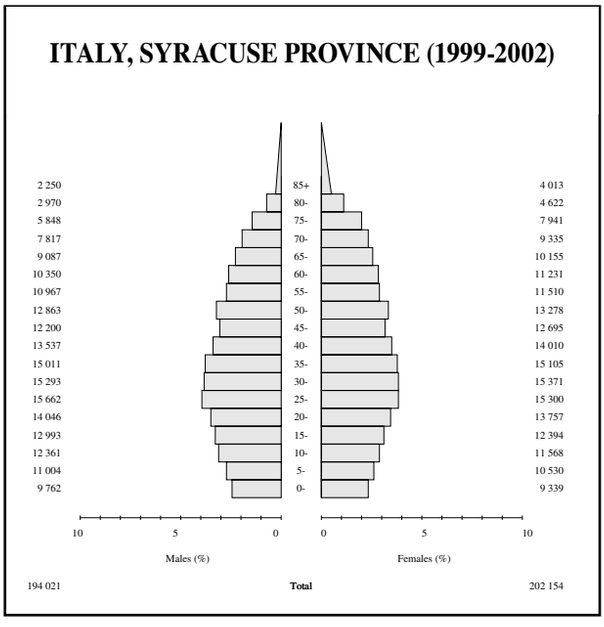
Source of population
Census 2001 and population estimates for 1998–2000 (National Institute of Statistics, ISTAT).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Italy, Syracuse Province

Registration area

The Syracuse Cancer Registry inhabits the Territorial Registry of Pathology (RTP) of the Local Health Authority of Syracuse. The Registry covers 21 municipalities within the province of Syracuse in southeast Sicily. The area consists of a western highland with altitudes ranging from 450–865m, and an eastern coastal plan facing the Mediterranean Sea. The province borders the province of Catania in the north and the province of Ragusa in the south. The population density is 193 inhabitants/km^2. The province has about 400 000 inhabitants; the principal town, Syracuse, has about 123 000. People over age 65 comprise 15.5% of the population; those under age 14 comprise 17%. The area is socioeconomically heterogeneous, with an industrial economy in the cities of Augusta, Priolo and Melilli, and an agricultural economy in the north (District of Lentini) and south (District of Noto). The great majority of Syracuse's population is employed in tertiary activities, especially tourism. With a few exceptions, the population is of the same race and the same culture.



Cancer care facilities

In the area covered by RTP there is a main hospital (A.O. Umberto I) in Syracuse and four other public municipal hospitals (in Lentini, Augusta, Avola and Noto), five certified private hospitals and 396 general practitioners. The Syracuse and Avola hospitals have medical oncology units with chemotherapy services. There are no radiotherapy services. The province has few cancer care facilities; many patients are admitted to hospitals and specialised institutes outside the RTP area at the University of Catania. Many cases are diagnosed and treated in extra-regional hospitals with comprehensive cancer services (esp. in northern Italy).

Registry structure and methods

The registry is sited within and supported by the Healthcare District of Syracuse. RTP was established in 1997 by the Sicilian Government with the partnership of Department of Hygiene of the University of Catania and the Syracuse Local Health Authority. In 2005 it joined the new Integrated Cancer Registry (RTI) of the Province of Catania, Messina and Syracuse. Two full-time epidemiologists, one part-time epidemiologist, two full-time health nurses and one full-time registrar staff the registry, with MDs and undergraduates (epidemiologist and pathologist) of the University of Catania. RTP started on 1 January 1999, after a one-year experimental phase to evaluate feasibility and to collect prevalent cases. Registration is voluntary and based on active casefinding.

The major information sources for the Syracuse Cancer Registry are histology and cytology reports, the regional archive of hospital discharge forms, hospital clinical records, the archives of private clinics, clinical and administrative records of local healthcare districts, and death certificates obtained from the department of public health. The registry checks municipality rosters for vital status.

Since 1996 the Registry has received from the Regional Department of Epidemiological Observatory the records of all residents admitted to any regional or extra-regional hospital. Active casefinding is undertaken in hospitals, pathology laboratories, and local healthcare districts. The department of public health provides copies of death certificates for all causes. Arrangements have been made with hospitals outside the region to notify the Syracuse residents diagnosed and treated in their area. A traceback is performed for undefined malignity, unknown primary site, with outpatient record as the only source or other missing information as well as death certificate notifications. Traceback includes contacting the general practitioner and rescreening the sources.

Data collection and registration is done in three steps: a) checking data quality and linkage with the other information; b) evaluating and coding all cases by two epidemiologists; c) computer entry with IARC CanReg software. Follow-up procedures include periodic record linkage with mortality data. Specific procedures and keywords restrict file access.

Interpreting the results

The insufficient cancer care facilities and the number of cancer patients hospitalised outside the province create many problems for casefinding. Differential distribution of environmental and occupational exposure can lead to different incidence rates. In the registry area some suspected etiological factors have been investigated. Chemical industries in Augusta, for example, represent the main source of water and air pollution that influence the high incidence rates of several tumours, especially of lung cancer.

Since 2001 there have been population-based screening programmes for breast cancer and cervical cancer in Syracuse city (although breast cancer screening was interrupted in 2004). PSA testing is commonly used as a diagnostic technique, but not in organised screening programmes.

Use of the data

The Registry aims to identify cancer incidence in an area (southern Italy) formerly covered only by the Ragusa Cancer Registry, that has low incidence rates, probably related to Mediterranean dietary habits and lifestyle. The registry seeks to establish these incidence rates to evaluate future needs and to target prevention activities appropriately. The registry contributes to local cancer control strategies via monitoring cervical cancer screening and evaluating health

services. The registry prepares an annual report of cancer mortality and, more recently, of incidence as well. The Registry is not currently involved in national or international epidemiological research, but data are provided to the Local Health Unit and the Regional Government for planning health services. Survival studies will be possible after five years of recording.

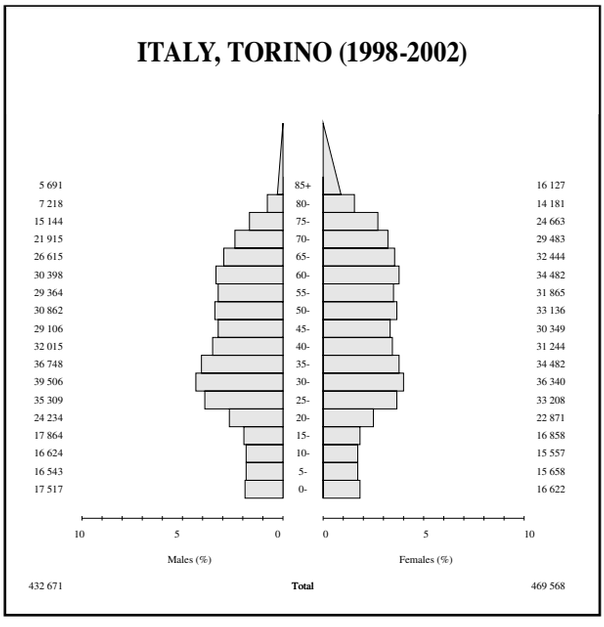
Source of population
Source of population is the 2001 census, taking into account birth, deaths and migration, produced by the National institute of Statistics (ISTAT).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Italy, Torino

Registration area
The area covered by the Piedmont Cancer Registry corresponds to the city of Torino, which is the main city of the Piedmont Region, in the northwest of Italy. At the year 2001 census the population was 902 235 inhabitants. The present population structure is still influenced by significant internal migration: 4.4% of the population was born in the northeast of Italy, 4.5% in the centre and 26.6 in the south. This composition may influence incidence figures, as people born in southern Italy have lower risk profiles than people born in northern regions.

Cancer care facilities
In Turin and its surroundings there are 14 public hospitals and 12 private clinics: all these hospitals and clinics offer cancer treatments in varying proportions. Recently the Piedmont Region has developed a regional network for cancer services with four sub-areas serving the city of Turin. Since 1992, two screening programmes have been set up in the Turin area: mammographic screening for women aged 50–69 years and cytological screening for women 25–64 years of age. In 1998 a screening program for colon cancer was implemented, based on sigmoidoscopy for men and women aged 58 years or faecal occult blood test for men and women between 59 and 69 who refused the sigmoidoscopy.



Registry structure and methods
The Registry is a part of Centre for Cancer Prevention (CPO). The registry is staffed by a director, two epidemiologists, two full time registrars and six part-time registrars. Sources of information and methods of registration remained unchanged in recent years.

The principal sources of information for the Registry are: a) the hospital archive of clinical records; b) the regional archive of hospital discharge forms; c) pathology reports; d) the archives of Day Hospitals and Radiotherapy Services; e) health insurance files for those cases treated outside the region; and f) death certificates. The Registry has access to the municipality roster in order to check personal data for vital status. Registration is carried out in an almost completely active manner. The collection of data comes about in two steps: a) a provisional input into a portable computer, carried out at hospital archives after reading clinical records and histological reports; b) a definitive input, after checks for data quality and linkage with other information. Follow-up procedures include periodical record linkage with the mortality Registry and the active follow-up in the municipality rosters.

Interpreting the results
During recent years, the incidence trend slowed its increase. Tobacco- and alcohol-related cancers are clearly decreasing in both sexes, with the only exception being lung cancer in women.

Breast, colorectal and prostate cancers are increasing, mainly due to the screening programs (for breast and colon) or the increasing use of opportunistic PSA testing.

For more than a century, Torino has been the Italian capital of automotive industry (cars, trains, trucks, planes). In recent decades, automation of the production processes had importantly cut the proportion of manpower, as well as had improved the working conditions and put occupational hazards under strict control. However, due to the latency of cancer induction, a consistent occupational etiological fraction is still present in the Turin cancer incidence of mesothelioma, lung and bladder cancers. Furthermore, this heavy industrial environment, together with road traffic, has also induced significant air pollution, responsible for a further fraction of respiratory cancers.

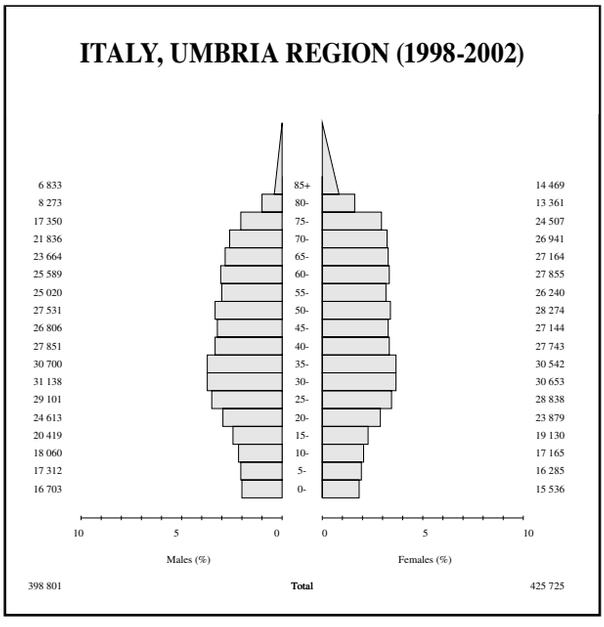
Use of the data
The registry provides periodical reports on cancer incidence, prevalence, mortality and survival, published and updated on the web (www.cpo.it). The data are used by local heath authorities for planning for the regional network of cancer services. The data are also sent to the Italian Cancer Registries Association database. The Torino branch of the EPIC cohort study is annually linked with the Piedmont Cancer Registry in order to check the occurrence of cancers. A follow-up facility is also provided on demand for clinical epidemiological studies.

Source of population
Municipality rosters (balance of resident population recorded by the municipality roster at the end of each year).

Multiple primary rules used
IACR rules (2004) on historical data.

Italy, Umbria Region

Registration area
The Umbrian population-based Cancer Registry covers the population of the Umbria Region. Umbria is a small Region in central Italy, divided into two Provinces. The regional population was 825 826 inhabitants (426 664 females) at the last census (2001). The region's area is 8456 km^2, and population density is about 96 inhabitants per km^2. The population is older than the Italian average: the ratio of people >65 years old to all residents is over 23%. The population is stable, growing slowly due to migration while natural balance is negative. Foreigners, most of them coming from Eastern Europe and North Africa, form about 2% of the resident population. Nearly 70% of people live in centres of >5000 inhabitants. The great majority of Umbria's population is employed in services and industry (agriculture 6% both sexes). The unemployment rate is at 8.9%.



Cancer care facilities
Health care is provided mostly in public hospitals and districts of the 4 Local Health Services. There are 2 main teaching hospitals and 18 public hospitals in the region with 3949 beds overall, as well as 5 private clinics.

The main specialised oncology centres (including clinical oncology, surgical oncology, paediatric oncology, radiotherapy and haematology specialties) are located in the two larger cities, Perugia and Terni (maximum distance within the region 55km). As an overall technology investment indicator 18 TC, 7 RMN, and 2 PET are available in the regional centres (data from Osservatorio Regionale Tecnologie).

Registry structure and methods
The Cancer Registry is managed at the Department of Hygiene of the University of Perugia. The registry is funded by the Regional Health Authority while staff and equipment are supplied by the University. All the staff is yet part-time. Sources used for casefinding include public and private clinics/hospitals outpatient records, pathology reports, radiotherapy outpatient records, and death certificates.

Relevant information for eligible cases (i.e. residents) is abstracted from medical records of 20 public and 5 private hospitals. Other sources of data are cytology centres for cervical cancer screening, personal case histories and independent studies, reimbursement requests for patient treated outside the region, and other cancer registries.

A traceback is performed for cases of undefined malignity, of unknown primary site, with outpatient record as the only source or with other missing information besides death certificate incident cases. The traceback procedure includes contacting the family doctor and re-abstracting or re-screening of acquired sources.

Interpreting the results
Opportunistic screening for cervical cancer was introduced long ago. More recently, the opportunistic screening was supplanted by an organised programme, and an organised screening programme for beast cancer was also introduced (1999). Opportunistic screening activities for prostate cancer and melanoma do exist, but are perhaps less widespread than in most other northern Italian regions. Invitation letters for the first round of the large bowel screening program are now being distributed. Historically, there has been an area of high risk for gastric cancer in the north of the region.

Use of the data
Annual incidence and survival reports are produced and distributed. A survival study by prognostic factor for breast and large bowel cancer is ongoing. The registry participates in various multicenter researches (e.g. the EUROCARE study on patient survival, the OCCAM study on occupational cancer monitoring, and the IMPACT study on breast cancer screening effectiveness). Policymakers also use registry data for planning and evaluation of health services.

Source of population
Census 2001 and population estimates for 1998–2000 and 2002 (ISTAT).

Multiple primary rules used
IACR rules based on ICD–O–1.

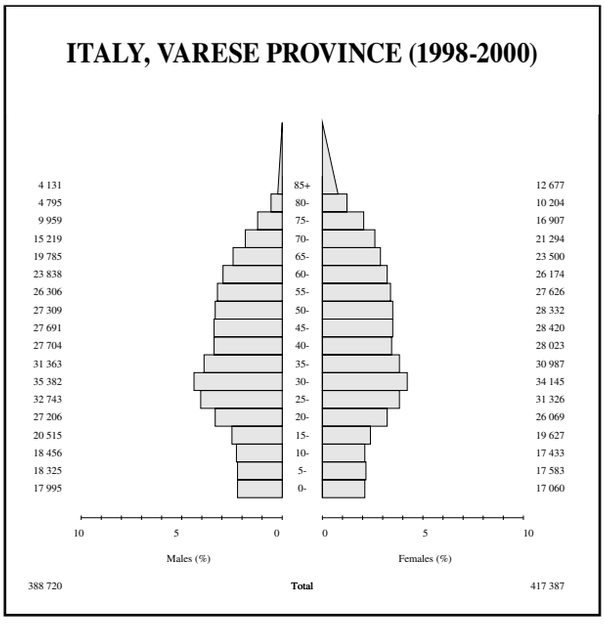
Italy, Varese Province

Registration area

The Province of Varese is in northern Italy. It is bordered to the north by Switzerland, to the west by Lake Verbano and the river Ticino, which mark the border with the Region of Piedmont, and to south and east by two other Provinces of the Region of Lombardy, to which Varese Province also belongs. The northern part of the Province is mountainous; the southern part encompasses part of the Lombardy plain and is flat. The Province has an area of 1198 km^2.

The population has increased considerably since the 1960s (581 526 in 1961; 807 579 in 2000). In these years considerable numbers of people have moved into the Province from eastern and southern Italy. Those who settled tended to retain the distinctive dietary and cultural habits of their origins, which differ considerably from those of the indigenous population. These differences have made it possible to conduct descriptive studies on differences in cancer risk by place of birth and also to perform analytical studies on diet and cancer.

The population density is 695.6 inhabitants per km^2. The ratio of elderly to children (over 64 years/less than 15 years) was 132.8 in 2000. Currently about 43% of the working population are employed in industry—a considerable decline compared to 1971—and about 2% are employed in agriculture; it is not possible to partition the Province into urban and rural areas.



Cancer care facilities

The Province of Varese is served by 11 general hospitals, including one university teaching hospital with modern facilities for the diagnosis and treatment of cancer. There are also five private clinics. There are 3950 hospital beds; the hospitalization rate is 161/1000 per year.

Registry structure and methods

The Lombardy Cancer Registry, which serves the Province of Varese, was established in 1974; is it now called the Varese Cancer Registry. The Registry is supported by the Lombardy Regional Health Authority and is run by the Cancer Registry and Environmental Epidemiology Unit of the Milan National Cancer Institute. The professional registry staff consists of three epidemiologists, two data managers/statisticians, three case ascertainers and three clerks concerned with record linkage and the checking of data.

The Varese Cancer Registry uses an automated cancer registration system, called Open Registry (Methods of Information in Medicine 2005;44:66-71) developed in-house and based on the Linux operating system and Oracle database. The main electronic information sources are *hospital discharges*, routinely generated by all hospitals in Italy; *surgical pathology reports* from pathology units in the Province and, since 1998, from major pathology units outside the Province, which often examine specimens from persons resident in the Province; and *mortality data* from Local Health Units. Using the Open Registry software and translation tables to cope with the different information coding systems in use, 60% of cases are identified and accepted automatically. For the remaining cases, the clinical records are scrutinised manually. The accuracy of the automated system has been tested by comparison with manual registration and showed a site code concordance between the two systems (automated and manual) of 98.4%. In collaboration with Local Health Units of the Lombardy Provinces of Brescia, Mantova and Sondrio of the Lombardy Region, Open Registry has been exported to the Cancer Registries of these Provinces. The completeness of registration is monitored yearly using capture-recapture methods. Clinical consistency is also checked routinely by re-abstraction and manual recoding of a random sample of cases.

The Varese Cancer Registry participates in major epidemiological studies, including those of EUROCARE, ORDET, EPIC and ACCIS.

Source of population

Estimates (ISTAT http://www.istat.it).

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

Italy, Veneto Region

Registration area

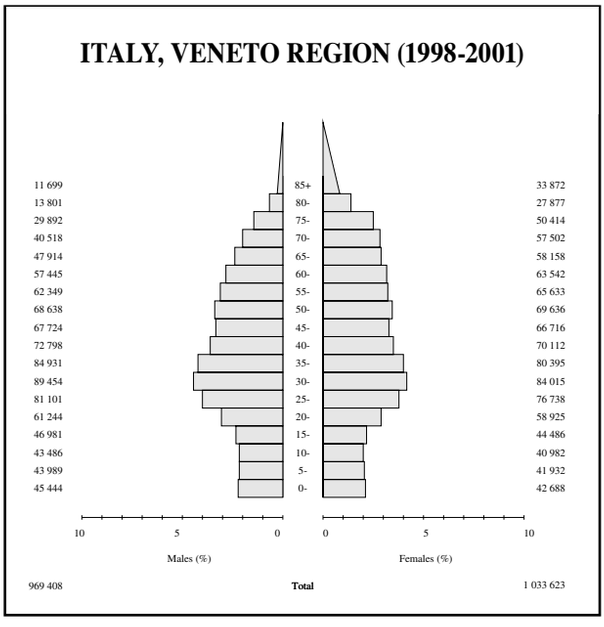
The Veneto Region is the largest region in Northeast Italy, with 4 527 694 inhabitants at the 2001 Census, 44% of whom (2 002 705 inhabitants) reside in the area covered by the Veneto Tumour Registry, which includes six of the seven major urban centres and almost all the mountainous part of the Region.

Immigrants make up 6% of the population covered by the Veneto Tumour Registry (source: Ministry of the Interior). Most of these come from Eastern Europe (47.8%) and from Africa (16.7% from Maghreb and 11% from other Countries); 15% are from Asia (including China).

Most Venetians are Christian Catholics, whereas half of immigrants embrace Christian religions (25% Orthodox Church, 17% Catholic, and 4% Protestant); a third of the foreign population is Muslim.

The Region encompasses many of the leading economic districts in Italy: the unemployment rate in 2001 was only 4.1%, compared to the national average of 11.6%.

At the 2001 Census, employment was distributed as follows: 4% in agriculture, 42% in industry and 54% in other activities (national averages are 5%, 34% and 61%, respectively): industrial activities are distributed throughout the territory rather than being geographically concentrated.



Cancer care facilities

Twenty-one Local Health Units (LHU) are responsible for all public health-related matters, including the management of all the hospitals in the Region (98 in the year 2000). Only the two major hospitals are managed autonomously. Most of the LHUs provide comprehensive services for cancer diagnosis, surgery and chemotherapy: radiotherapy and a few expensive diagnostic tools are available at least at county level (the Region includes seven counties), while patients with rare cancers or particular sites involved (i.e. brain tumours) are mostly referred to a restricted number of departments. Paediatric patients are treated in the two major hospitals.

Registry structure and methods

The Registry is financially supported by the Regional administration. The staff is composed of a physician (director of the registry), three registry operators, three statisticians, a data manager, two computer programmers and two clerks with secretarial and data-entry duties.

The registration system uses medical information, received annually from the following computerised and codified sources:

1. Hospital discharge records from all the hospitals in the region, transmitted by the Regional Department of Social Security and Health;
2. Death certificates relating to all deaths among residents in the region, transmitted by the same Department; and
3. Pathology records transmitted by the fifteen pathology laboratories covering the registered areas.

Furthermore, all the LHUs of the region transmit a copy of the population files, which are merged into a single archive, used as a reference for linking source records: the latter are evaluated using a case resolution programme that accepts: cancer cases where data from two or more sources are identical; histologically confirmed cases in the presence of other compatible hospital diagnoses (e.g. metastases or ill-defined sites); and histologically confirmed skin cancer unless combined with skin melanoma.

The programme rejects diagnoses based on only one source (unless based on histology), multiple primary tumours and discordant or incompatible diagnoses: in these situations manual checking is carried out by the registry operators, who where necessary gather further information from the local information systems of the LHUs and clinical records from the hospitals.

A quality assessment of automatically accepted cases was carried out by a re-abstraction study in the year 2002, with positive results, and a few corrections were consequently made to the programme.

Interpreting the results

The proportion of aged population has markedly increased: ageing index for the whole region, which was 107 in 1991, had become 136 in 2001; in the area covered by the registry it rose from 119 to 145.

A prevention programme for early detection of skin melanoma has existed since 1990. Organised screening for breast and cervix cancer detection started in 1998 in three and five LHUs, respectively, and progressively included further LHUs. PSA testing became a routine practice in the late 1990s.

Use of the data

Incidence figures with LHU details are reported on the Registry website, as well as prevalence and survival figures for the entire Registry area: a report has also been prepared and some small area analyses of incidence and mortality have been carried out.

The Registry collaborates with all other Italian Registries in research projects and publications of incidence, prevalence and survival data.

The Veneto Tumour Registry is currently involved in epidemiological researche (EUROCARE IV, Concord, Haematocare, ACCIS, Eurocim, and others).

Veneto Tumour Registry's data are used for drafting the Oncological Regional Health Plan of the Veneto Region.

Source of population
1997–2000: Municipal registries estimates of population at 31st December (source: National Institute of Statistics, ISTAT). 2001: census, National Institute of Statistics, ISTAT. 2002: Municipal registries estimates of population at 31st December (source: National Institute of Statistics, ISTAT).

Multiple primary rules used
IACR rules (2004) on historical data

Latvia

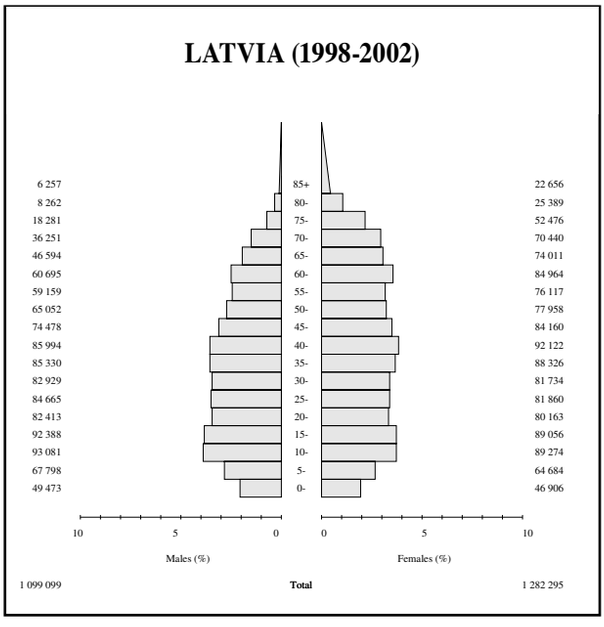
Cancer care facilities
The Latvian Oncology Centre, 2 regional oncology hospitals and the oncology department at the Republics Clinical Hospital provide complete specialized diagnostic and treatment services for the population of Latvia. All of these hospitals have well-equipped radiology departments. Specialised aid for children is provided by the oncology department of the Central Children's Hospital.

Registry structure and methods
The staff of Latvian Cancer Registry (LCR) includes 5 officials: an MD medical statistician, an epidemiologist (biologist), a programmer, a PC operator and the principal of CR (director).

All physicians and practitioners (GP, out-patient department, hospital, pathology and forensic medicine laboratory) have to report new cancer cases to LCR. At least quarterly the persons responsible for oncology at every district central hospital in the republic provide information on cancer in their districts (new cases, deaths, changes of therapy, progress of the disease, etc.).

Additionally, the LCR receives regular information from the Latvian Agency for Medical Statistics concerning the cases identified from death certificates.

The completeness of the data is evaluated by comparison of the CR data with the data of big hospitals. A specific evaluation study is not performed.



Registration area
Since 1965, the cancer registry has covered all the population of the republic, but a separate cancer registry unit (LCR) was organised in 1993, after state independence was re-established. The area covered has not changed, but the population has changed considerably: in 1966–1967 mainly because of the departure of Soviet Army troops and their families; during the reporting period (1998–2002) about 29 000 of the population were lost because of emigration; but mainly—about 71 000—because of the natural decrease in the population (about 14 000 persons per year).

Interpreting the results
The availability of medical services is nearly the same over time, with some difficulties for the less-secure population, but cancer diagnosis and treatment possibilities have increased.

From the beginning of the registry the ICD-7,8,9 revisions were used for coding of malignancies. Now all data are transformed to ICD-10 (topography) and ICD-0 (morphology) codes.

No organised screening programmes have been organised in Latvia, but opportunistic programmes for breast cancer (mammography) and cervical carcinoma (Pap smears) as well as PSA tests are ongoing.

Use of the data
The LCR publishes regular statistical issues. During the 1998–2002 period: *Cancer Incidence in Latvia 1997–1998* (the 4th issue) and *1999–2000* (5th issue); *Cancer Mortality in Latvia, 1980–2000* (2002) and *Cancer Incidence and Mortality in Latvia, 2001–2002* in 2004.

The LCR is not currently involved in epidemiological research, but some projects have been completed recently. The CR data are widely requested and used by policy makers, insurance companies, etc.

Source of population
1998–1999 Central Statistical Bureau of Latvia (estimation allowing for the birth/death levels and migration. Census 2000 (March 31, 2000): Provisional results of the 2000 population census – Statistical bulletin, Riga, 2001, 62p. 2001–2002: Estimated data from the Central Statistical bureau of Latvia.

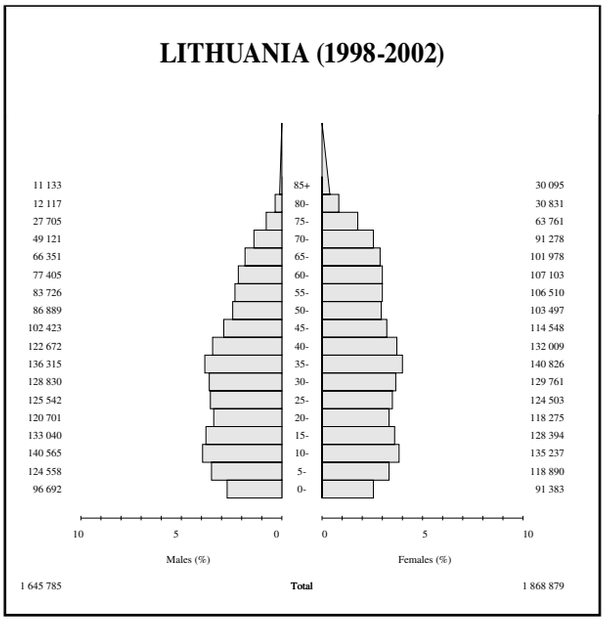
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Lithuania

Registration area
Lithuania is the southernmost of the Baltic States, which were part of the USSR from 1940 through 1990. In 1990, Lithuania gained independence. Lithuania has total land area of 653000 km^2 giving a population density of 53.68 persons per km^2. The resident population in Lithuania in 2001 was 3 483 972 – 1 629 148 males and 1 854 824 females (census data) where 83.45% of inhabitants are Lithuanians, 6.74% Polish, 6.31% Russians, and 3.5% others. Birth rate in Lithuania has been decreasing for the last decade, and it continues to fall. In 2000, the crude birth rate was 8.52 per 1000 population. Average annual rate of natural increase was –1.3%. The infant mortality was 8.52 per 1000 live births.

Cancer care facilities
There were 97.9 hospital beds and 40.3 medical doctors per 100 000 population in 2000. The availability of diagnostic and treatment services is increasing. Modern complex treatment of oncology patients (surgery, radiotherapy, chemotherapy) is provided at Institute of Oncology Vilnius University, Kaunas Medical University Clinics, Klaipeda City Hospital and Siauliai City Hospital. Surgery and chemotherapy are also available at other university hospitals and major treatment centres.

The highly centralised healthcare system has been finally changed to a state insurance-based system in 1997. The changes required the registry to establish new connections with primary healthcare centres (360 in 2006) that became to play a major role in primary cancer assessment and referral of patients to diagnostic services.



Registry structure and methods
The cancer registry operates as a separate department of Institute of Oncology, Vilnius University. The registry staff includes 10 employees: epidemiologist, medical doctor, medical coders, programmer and registry clerks. Support to the registry is provided by the Institute of oncology. The principal sources of information on cancer cases are primary, secondary and tertiary healthcare institutions that are required to complete a notification when cancer is diagnosed.

Lithuania has a compulsory nationwide cancer registration since 1957. Administratively Lithuania was divided to 44 districts ("municipalities") up to the year 2000. The new administrative division is built upon 60 municipalities established within the borders of previous territory units. Some of districts were split in two or three municipalities; some small territories were joined across borders. The cancer registry successfully adopted the new territorial division without loss of information on long-term trends within major units.

The compulsory case notification includes surname, name, sex, date of birth, place of residence, nationality, date of diagnosis, site according to ICD-9 from 1978 through 1997 and according to ICD-10 since 1997, morphology according to ICD-O-2 edition since 1993 and ICD-O-3 since 2003. Before 1993, a local one-digit morphology code was used. The cancer registry file is updated monthly with information on death certificates that are completed according to the international standards. The last update for the analyses presented here was done on 31 March 2005. On average, two notifications from different sources per skin melanoma case were registered since 2000.

There are obstacles to continuing the full-scale activity of the cancer registry due to legislative issues. The first regulations of the registry were signed by the Ministry of Heath in 1984. Discussion continued on cancer registry regulations despite the law on the registries adopted by the Lithuanian Parliament in 1996. The importance of the registry data was recognised by researchers, health care organisers and policymakers. The cancer registry data was used as a basis for the National Cancer Control programme adopted by the government in 2003, establishing cervical and breast cancer screening programmes and numerous local investment projects funded by EU and local sources.

Interpreting the results
During 1998–2002 there were no nation-wide cancer screening programmes. Some small-scale opportunistic activities were established for cervical, breast or colon cancer. PSA testing became widely available around 2000. The cervical cancer screening programme with a 3-year invitation interval started in June 2004. The mammography screening programme started in May 2006 though it is still lacking coverage due to limited mammography services. Despite the opposition of the experts, lobbying activities forced the introduction of nationwide free PSA testing in 2006. The registry is responsible for evaluating the effectiveness of these cancer screening programmes.

Use of the data
Annual registry reports on cancer incidence, extent of disease, microscopic verification of cases, mortality, and prevalence by site and municipality have been published since 1994. Registry publications covering incidence and mortality trends and survival data have been published on some individual sites. The registry is also involved in cancer epidemiology research, and has participated in several descriptive and occupational epidemiology projects including Chernobyl clean-up workers, nuclear workers, radiologists, and asbestos-, cement- and wood dust-exposed workers. The occupational exposure pattern in Lithuania follows that in industrial countries; study of environmental radiation exposure due to Chernobyl is needed in order to evaluate the consequences for the general population. A study of clean-up workers from Lithuania shows no elevated cancer risk.

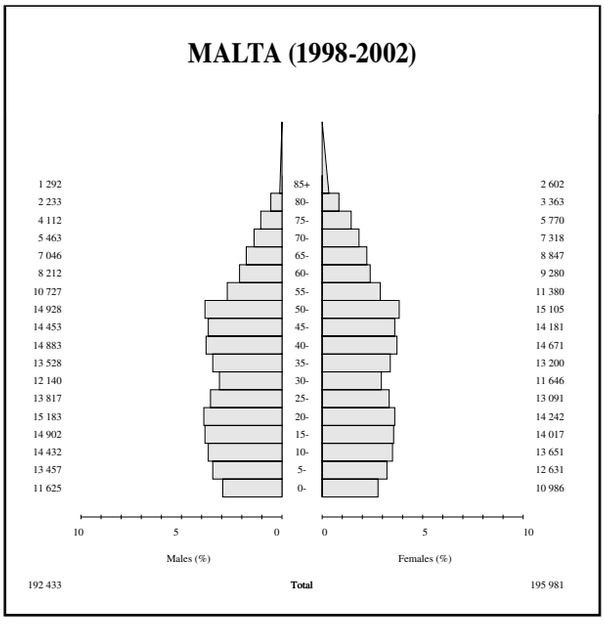
Multiple primary rules used
IACR rules (1990).

Malta

Registration area
The Malta National Cancer Registry covers the population of the Maltese Islands, a small archipelago in the middle of the Mediterranean Sea. The total resident population at the most recent census (2005) was 404 039.

There is no clear distinction on the islands between urban and rural areas. However the harbour area (centred around the capital Valletta) can be considered as the most urban, with much of the rest of Malta being suburban, and most of the northwest part and the whole of Gozo being rural.

The majority of the local population are Roman Catholic. The number of foreigners resident on the Islands is increasing, leading to growing changes in the ethnic compositions of the resident population. The Maltese people are descendents of ancient Carthaginians and Phoenicians, with strong Greco-Roman and Arab influences. European elements, namely Italian, Spanish and French with traces of Anglo-Saxon origins, were assimilated later.



Cancer care facilities
In Malta, there is a comprehensive national health service that is available to all Maltese residents and entirely free at the point of delivery. All residents have access to preventive, diagnostic, therapeutic and rehabilitative services in the Government Health Centres and Hospitals. The public health services are funded from general taxation. There is one major general acute hospital in Malta, a smaller one in Gozo and a number of public health centres scattered all over the islands. Since 1996, three private hospitals have also been operating in Malta. Cancer surgery is carried out in any of the above-mentioned hospitals, whilst radiotherapy and most of the chemotherapy are given at the oncology department in Sir Paul Boffa Hospital, which is the only cancer centre in Malta.

Registry structure and methods
The registry is located near to the major general acute (St. Luke's) hospital in Malta. It is part of the Department of Health Information within the Health Division and is wholly funded by the Government of Malta. A full-time principal medical officer, one full-time and one part-time registrar staff the registry.

The Malta National Cancer Registry uses both active and passive methods from multiple sources for data collection. Active data collection includes review of and extraction from the pathology laboratories' reports databases (histology, cytology and autopsy reports) of cases of cancer, review of the hospital files of known cases and collection of information from the National Mortality Registry (both active and passive). Passive methods include the receipt of notifications of cancer from the clinicians, a monthly report from the Oncology department on the new cases referred to their department and an annual report on the cases of cancer sent abroad for treatment by the state.

The National Mortality Registry is also housed within the Department of Health Information, and linkage between the cancer and mortality databases is routinely performed. The mortality registry is the recognised national source on death statistics.

Interpreting the results
It is estimated that only a small proportion of the cancers diagnosed in Maltese residents remain unregistered. These mainly include cases diagnosed, treated and followed-up abroad. The registry staff actively tries to reduce the proportion of cases that remain registered on the basis of a death certificate only by reviewing all possible medical information on the cases. The staff is permitted access to the hospital files of cases diagnosed and treated at all public and private hospitals and clinics.

To date, no organised cancer screening programme has been implemented in Malta. However, facilities for opportunistic screening for breast, cervical, prostate and colorectal cancers are available locally.

Use of the data
The registry has published cancer incidence and mortality information since 1992. On the registry's web site (http://www.sahha.gov.mt/pages.aspx?page=91) there are files with cancer incidence and mortality data for Maltese residents from 1994–2005/6 as well as other cancer statistics including survival and temporal trends. The registry is the recognised national source of information on cancer incidence. Its staff annually answers several requests for information originating from various sources, including both local and foreign clinicians and other professionals, students, journalists and interested organisations.

Source of population
1998–2002: Post–censal estimates. Census data with addition of births and immigrants and deletion of deaths and emigrants.

Multiple primary rules used
IACR rules (1990).

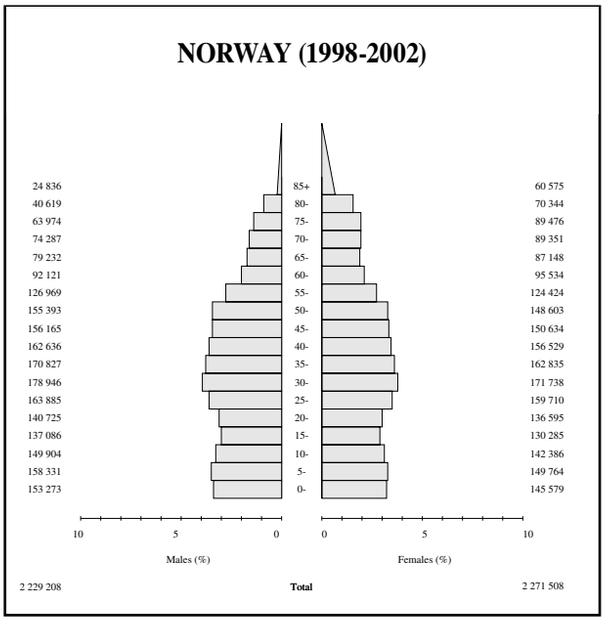
Norway

Registration area

Norway covers 324 000 km^2 between latitudes 57° and 71° N and longitudes 4° and 31° E. The total population is 4 640 219 (1 January 2006), most of whom are Caucasians, but 0.5% are Lapps and 8% are foreign-born (2% western and 6% non-western). At the 2005 census the main occupations for men were: industry 32%, agriculture 5%, community 22% and other services 41%; the corresponding figures for women were: industry 1.5%, agriculture 8%, community 57% and other services 33%.

Cancer care facilities

In 2004 there were approximately 4 hospital beds and 3.5 physicians per 1000 inhabitants. Surgical treatment of cancer is carried out both in general hospitals and at oncological centres. There are about 90 hospitals (both private and public) and a number of private clinics offering diagnostics and treatment of cancer in Norway. Most cancer diagnosis and treatment is, however, carried out at the public hospitals. These hospitals are organised in regions covering different parts of Norway (Eastern Norway Regional Health Authority, Southern Norway Regional Health Authority, Western Norway Regional Health Authority, Central Norway Regional Health Authority and Northern Norway Regional Health Authority). There are 10 radiotherapy departments in Norway, situated at different parts of the country.



Registry structure and methods

The Cancer Registry of Norway was initiated by the Norwegian Cancer Society and established in 1951. Since 1979 the Ministry of Health and Social Affairs has been administratively and financially responsible for the registry.

There are 130 employees in the Norwegian Cancer Registry. The Cancer Registry is organised in 4 departments: an administration (29 employees, including 9 information and 13 IT-staff) and three research departments (environmental and occupational research, screening research and clinical research). The staff consists of, among others, doctors, scientists, statisticians, research assistants, IT staff, economy, personnel and PR.

Site and morphology have been coded according to ICD-O-2 since 1993. Before 1993, site was coded according to ICD-7, while the morphology was coded according to a modified version of SNOMED. Primary tumours in different organs in one individual are classified as independent tumours. If multiple tumours occur within paired organs or other sites within the same ICD code (e.g. kidney, colon), the case is classified in such a way that it can be counted either as one primary cancer only or as the number of primaries that actually exists. For the female breast, two primary cancers may be registered in one individual. A double coding system is also used for lymphomas. Lymphomas in, for instance, the tonsils or the stomach are coded both to the lymphoma site and to the specific organ site.

The registry is based on compulsory reporting of all new cases of cancer in the Norwegian population since 1953. Each year the registry receives more than 100 000 reports which include clinical forms, copies of cytology, biopsy and autopsy reports, and copies of death certificates from Statistics Norway. In recent years the Patient Administrative System has been linked to the Cancer Registry of Norway to ensure completeness and quality. The registry is organised as a multi-user online database. All reports are interpreted and, after coding, updated and processed. At regular intervals, the registry material is matched against all deaths in the country and date and cause of death are recorded. Since the 1960 census, all inhabitants in Norway have had a unique personal identification number, and this number is used to link records from the different data sources.

Interpreting the results

The Norwegian Cancer Registry has both a cervical screening programme and a breast screening programme. PSA testing has become increasingly more common since the first commercial PSA test became available in 1989, and is now very common in the Norwegian population.

Use of the data

The purpose of the Cancer Registry is to:

- collect and, within the scope of the Regulations, process data relating to cases of cancer and cancer studies in Norway in order to document the distribution of cancer in the country and describe changes over time;
- conduct, promote and provide a basis for research to develop new knowledge of the causes, diagnosis, natural course and effects of treatment of cancer in order to improve and enhance the quality of preventive measures and medical assistance that are offered or provided to combat cancer, including the follow-up of individual patients and groups of patients;
- provide advice and counselling on medical assistance to combat cancer; and
- provide advice and information to other public administrative bodies and the population at large on measures that may prevent the development of cancer.

In addition to such purposes data in the Cancer Registry may be processed for the following purposes: management, planning and quality assurance of public health services and the public health administration, for the preparation of statistics and for research.

Main research areas are etiological screening-based and clinical, based on population data and epidemiological methods.

Multiple primary rules used

IACR rules (2004) on historical data.

Poland, Cracow

Registration area
The Cracow Cancer Registry covers the population of the Małopolska Province in southern Poland, an area of 15 144 km^2, with 3 233 799 inhabitants.

In 2000 the City of Cracow, the data for which are presented here, an area 327 km^2, had 741 500 inhabitants (46.8% male, 53.2% female). The population is little differentiated ethnically, and the large majority is Roman Catholic. The city of Cracow is one of the biggest industrial (with metallurgical, electromechanical, chemical and food industries), cultural and educational centres of Poland.

Cancer care facilities
In Cracow, diagnostic and treatment services for cancer are provided by the Centre of Oncology Maria Skłodowska-Curie Memorial Institute (220-bed hospital and an out-patient department for 300 patients daily) as well as 22 clinics of Collegium Medicum Jagiellonian University. Types of treatment include chemotherapy, immunotherapy, surgery and radiotherapy. Patients are also treated at ten hospitals in Cracow.

Registry structure and methods
The registry is a part of the Epidemiology Unit of the Centre of Oncology Maria Skłodowska-Curie Memorial Institute, and receives financial support from the Ministry of Health and Social Welfare. The staff consists of an epidemiologist, four registrars, a statistician and one computer programmer.

Notification of cancer cases or suspected malignant neoplasms has been compulsory in Poland since 1952. All hospitals and outpatient clinics must report all cancer cases on special cards, which are submitted to the registry. In the registry, each new notification is compared and checked with the main database of cases already registered.

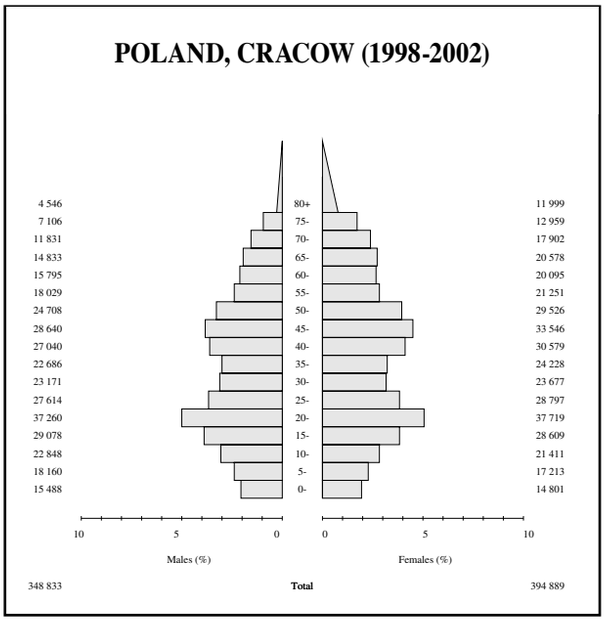
The registry also conducts active registration by checking hospital records, pathology records and death certificates. Patient follow-up is carried out by the registry every year through the checking of medical records and death certificates. If no data about cancer patients are available, information is collected via the Address Office in Cracow.

Quality control of the data is done using the IARC-CHECK programme and other programs developed in the registry.

Use of the data
The registry publishes an annual report of cancer incidence and mortality by sex, age, primary site and place of residence. In addition, the registry prepares survival analyses of cancer patients.

The Cracow Cancer Registry is participating in the EUROCARE international, multicentre studies on survival and care of patients. The registry also participates in studies on childhood cancer incidence and survival.

The registry data serve as a basis for planning of cancer control programmes and epidemiological research as well as for education of clinicians and postgraduate students in the field of cancer prevention.



Source of population
1998–2001: population estimates. 2002: Census.

Multiple primary rules used
IACR rules (2004) on historical data.

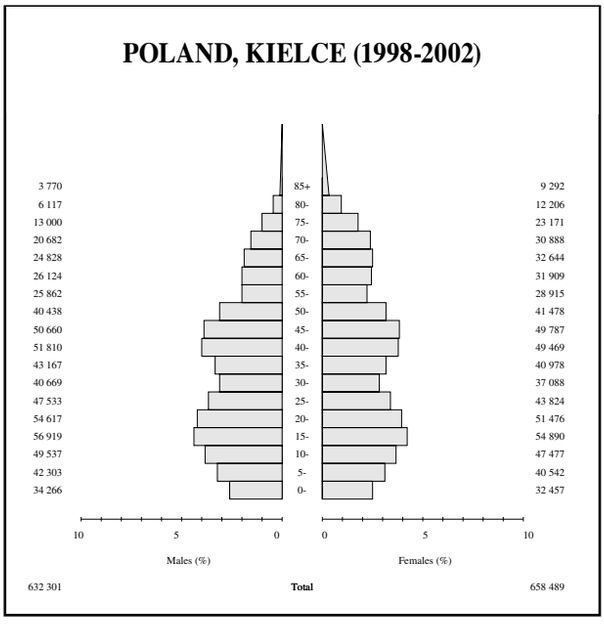
Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation). This registry has the lowest histological verification rate in the monograph.

Poland, Kielce

Registration area
The registry covers the Holycross Province (area 11 691 km^2), one of 16 provinces in Poland. It is located in the south-eastern part of the country between latitudes 50° and 51° N and longitudes 19° and 21° E.

The Holycross Mountains (with mountains about 600m above sea level) are situated in the northern part of the province. In the south there is a fertile agricultural region. The Vistula (Wisła) river forms the province's southeastern border. The annual average temperature is 6.9° C (max. 32.9° C and min.-33.9° C). Annual rainfall amounts to about 565mm.

The population as of the official statistical office estimate (30 June 2000) was 1 325 000 (about 3% of the Polish population), with 49% males and 51% females. Of these, 47% lived in towns and 53% in the country. The population of Holycross province is predominantly white race belonging to the Slavonic group; 95% are Roman Catholic.



Cancer care facilities
The Holycross Cancer Centre is located in Kielce, the capital of the Holycross province, and provides various services in the field of treatment (oncological surgery, chemotherapy, radiotherapy, brachytherapy, hematology, endocrynology, palliative care) and diagnostics (e.g. radiology, nuclear medicine, microbiology).

Registry structure and methods
The Holycross Cancer Registry is a department of the Holycross Cancer Centre; its full name is Department of Epidemiology and Cancer Control, Regional Cancer Registry. It is managed by a physician oncologist, one full-time biologist and four full-time registrars. The Registry closely cooperates with the IT department in data processing and statistical analysis.

All medical centres are obliged to report all cases of cancer on a special notification form that includes basic demographic and diagnostic information. These notification forms are the main sources of information on cancer incidence.

Although cancer reporting is obligatory, it is often neglected, and therefore all the received records are completed and checked by the registry staff against data obtained from local civil departments and hospitals.

The National Cancer Registry of Poland evaluates our incidence data every year. In 2002 the completeness was 100%.

Interpreting the results
In 1999, administration reform took place and the area of our registry was enlarged, and the population increased. In 1999 we changed from ICD-9 to ICD-10, and in 2002 we changed morphology from MOTNAC to ICD-O-3.

There are some organised and opportunistic screening programs for breast cancer, prostate cancer, colon cancer and cervix uteri cancer, and PSA testing is common.

Use of the data
The registry maintains two basic files: a computerised file containing the patients' serial number, sex, name and surname, date of birth, date of the first cancer diagnosis, ICD code and year of death (if applicable), and a file containing cards of first and follow-up registration arranged according to information mentioned above.

The registry prepares an annual report on cancer incidence and mortality for local government as well as sending the incidence data to the National Cancer Registry of Poland. The Registry cooperates with the European Network, IARC and IACR, and is a member of ENCR.

We report regularly on extent of diseases. The Registry is not involved in epidemiology research. Policymakers use our cancer registry data but (in our opinion) not in a sufficient way.

Every two years incidence data are sent to the National Cancer Registry of Poland, which publishes bulletins of cancer incidence in Poland.

Source of population
Central Statistical Office in Poland.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

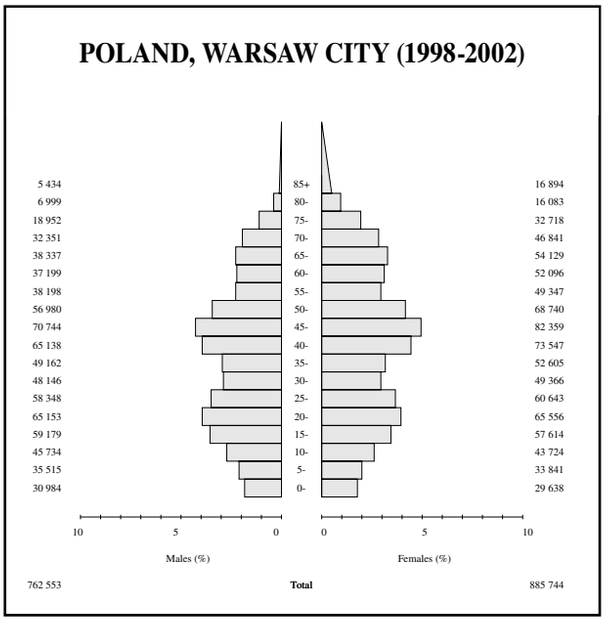
Poland, Warsaw

Registration area

In the years 1963–1988 the Warsaw Cancer Registry collected data on the population living in Warsaw city and selected rural populations in the provinces of Warsaw, Ciechanow, Plock and Siedlce. In 1989–1998 the Registry collected data on the population in Warsaw city and six voivodships (the Province of Warsaw, Ciechanow, Ostroleka, Plock, Radom, and Siedlce). After 1999 this area became one voivodship (Mazovian). The Mazovian Province covers an area of 38 000 km^2, 12.5% of the total Polish territory. The area is inhabited by 5 112 000 people (13.5% of the total Polish population).

Warsaw, the capital of Poland and the largest centre of the Mazovian Province, is a major industrial centre in Poland lying on the river Vistula, in the Mazovian Lowland in eastern central Poland, at 52° 16' N and 20° 59' E. The registration area amounts to 495 km^2, populated by 1 673 000 persons. The average altitude is 100m above sea level.

The population structure by sex and age groups was analysed on the basis of data released by the Central Statistical Office of Poland, valid by June 30 every year. The population-at-risk is the average of the population at 30 June of each the years 1998 through 2002, estimated on the basis of the 1988 Census population. The population is ethnically little differentiated, and mostly Roman Catholic.



Cancer care facilities

Poland is divided into 16 regions with regional oncological centres localised in each of them. Nationwide supervision is performed by the Maria Sklodowska-Curie Memorial Cancer Center and Institute of Oncology in Warsaw and two branches in Cracow and Gliwice. Provincial Oncological Clinics provide oncological diagnostic and therapeutic health services, including radiotherapy, in each of Poland's 16 provinces. The oncologists are usually concentrated where the oncological centres are located.

In Warsaw, specialised cancer care is provided by the Maria Sklodowska-Curie Memorial Cancer Center and Institute of Oncology, clinics of the Medical Academy, the Institute of Mother and Child and Center of Child Health. Patients are also treated at other hospital wards in Warsaw, district outpatient clinics and specialist private and public centres, as well as cooperatives and foundations. Warsaw has over 400 oncologists and 1000 oncological beds.

Registry structure and methods

The Warsaw Cancer Registry was one of the first Registries in Poland, established in 1963 in collaboration with the USA National Cancer Institute to conduct comparative studies on gastric cancer incidence in Poland and among Polish-Americans. These studies were subsequently extended to other cancers, and registration now embraces all sites. The registry is located at the Maria Sklodowska-Curie Memorial Cancer Center and Institute of Oncology in Warsaw, the institution responsible for organising nationwide epidemiological studies, scientific research, and therapeutic services related to cancer. It is supported by the Ministry of Health and Social Welfare. The total database now contains over 70 000 records from the old database (Warsaw and Selected Rural Areas: 1963–88), and over 260 000 from the new database (1989–2005). The Registry now contains over 50 000 records from the old database (1963–1986) and over 100 000 from the new (1987–2005).

The recording and reporting on a special reporting card of every case or suspected case of malignant neoplasm by all health service institutions and individual physicians has been compulsory in Poland since 1952. Information about cancer-related deaths in Warsaw in 1998–2002 was taken from death certificates issued by the Central Statistical Office of Poland. Since 1989 the database has been maintained in a computerised file arranged by patients' names, date of birth and cancer site, and a card file containing the first registration and follow-up cards arranged by sex and registration number.

The epidemiological data on cancer incidence in 1998–2002 in Warsaw were collected from the Cancer Reporting Cards (MzN-1) routinely submitted to the Warsaw Cancer Registry. The data collected are recorded on reporting cards and include personal identification data (name and surname, sex, date of birth, address, occupation); medical institution; date of first diagnosis/first hospital admission; primary site, pathology, clinical stage, method of diagnosis, methods of treatment, and (if applicable) date of death.

The reporting cards are sent from hospitals and outpatient clinics from Warsaw city, the region and other areas of Poland; for all from oncological outpatient clinics, medical records departments, and other cancer registries. New notifications are immediately checked for consistency of the identifying data. When more than one neoplasm is observed, with other histopathology, in the same person, a new card is prepared for each different site. All entries are checked for duplicates. Site is coded to ICD-9 (to 1998), to ICD-10 (from 1999) and histology to MOTNAC. Active and passive follow-up continue until the patient's death. If current data about the patient's vital status are unavailable, information is requested from the Address Register.

Interpreting the results

The percentage of underregistration was estimated in Poland in 1998–2002 at about 12%; however, in Warsaw underregistration is lower. In Warsaw there are organised

screening programs for the cancers of the cervix uteri, breast in women and for the cancers of colon and prostate.

Use of the data
The data are analysed to describe the patterns and trends of incidence and mortality by sex, age groups and cancer site in Warsaw. Clinical stage is also analysed for selected cancers. Survival studies are conducted, as well as analysis of treatment regimes for some sites. The data are published in annual reports, monographs, and other publications and papers. They are also used in many research projects and international collaborative projects. Policymakers use registry data for health services planning and evaluation.

Source of population
The estimation of the population at risk is based on the 1988 census, making allowance for births and deaths.

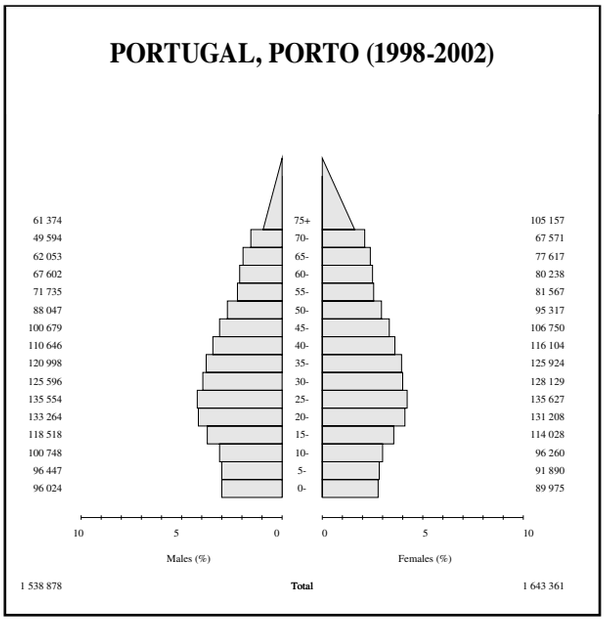
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Portugal, Porto

Registration area
The Registo Oncológico Regional do Norte (RORENO) registers all new cancer cases of the North Region of Portugal. According with the last census, in 2001, the population was 3 236 089 inhabitants distributed in five districts (Porto, Braga, Viana do Castelo, Vila Real and Bragança). The population reveals a relatively young age structure, and is fairly unevenly distributed, its density in Porto being 53 times greater than in the easternmost parts of the region.

The Portuguese population is remarkably homogenous and has been so for all of its history. Legal immigrants represent around 1.5% of the north population, and the largest communities are from Brazil, Cape Verde and Angola and lately from Eastern European countries. Around 96% of the population is Roman Catholic.

Some specific areas such as Ave and Minho-Lima are highly industrialised, mainly in textiles, clothing, footwear and furniture. The mountains on Northwest and the eastern region are predominantly rural areas with little socio-economic dynamism. The world's first demarcated wine region is located in the Douro Valley where Porto wine grapes grow.



Cancer care facilities
Porto is home to the main cancer treatment centre of the north region, the Instituto Português de Oncologia do Porto, which provides radiotherapy, surgery and chemotherapy for all patients. In Porto there are also two general hospitals capable of providing cancer treatment. Some kinds of cancer may be treated in the other districts. The health system is based on a network of primary health centres and is supplemented by private clinics and laboratories.

Screening programmes are mostly opportunistic and include cancers of the breast, cervix, prostate and colorectum. In 2001 population-based screening for breast cancer began in Bragança, involving 22 541 women.

Registry structure and methods
The registry is located in Porto at the Instituto Português de Oncologia, which is responsible for the co-ordination and organisation of the program and for the quality of its data. In 2000 a medical epidemiologist, two full-time registrars and a part-time statistician staffed the registry. Two medical pathologists were also included as consultants. The staff is responsible for treating the incoming information from the health institutions and also for quality evaluation.

The main method of data collection is passive notification of the cases. The majority of the information on classification of cancer arrives already coded (ICD-O-1). In 2000, 81.4% of the registrations (32 sources of data) were coming from public health institutions and 18.6% from eight private pathology laboratories and hospitals.

Since mid-June 2005 every hospital has had the ability to send the data via a common website: www.roreno.ipoporto.min-saude.pt.

Although the registry was built on a legal framework, access to a unique personal identification number is denied. Our main problems concern the promotion of the follow-up of all the cancer cases, access to digital death certificates and the completeness of some items as address and age.

Interpreting the results
There has been an improvement on completeness of data and for most cancer sites; incidence rates must be close to reality. Some undiagnosed cancers concern mainly those with clinical and radiological diagnosis only.

Uses of the data
Every year since 1988 an annual report of cancer incidence in the North Region has been published. Childhood cancer data were used for a few master's theses and for epidemiological studies. The registry receives weekly data requests for epidemiological studies on risk factors and survival. A study on quality (accuracy) of the data was published in 1995. Registry data have been used to support some projects of the Regional Health Administration, namely in planning of screening services.

Source of population
1998–2000: Official numbers for population in the north region, for years between census. For the year 2000, only age groups of 10 years were published and freely available. These estimates allow for births and deaths and to migration movements. 2001: official census.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

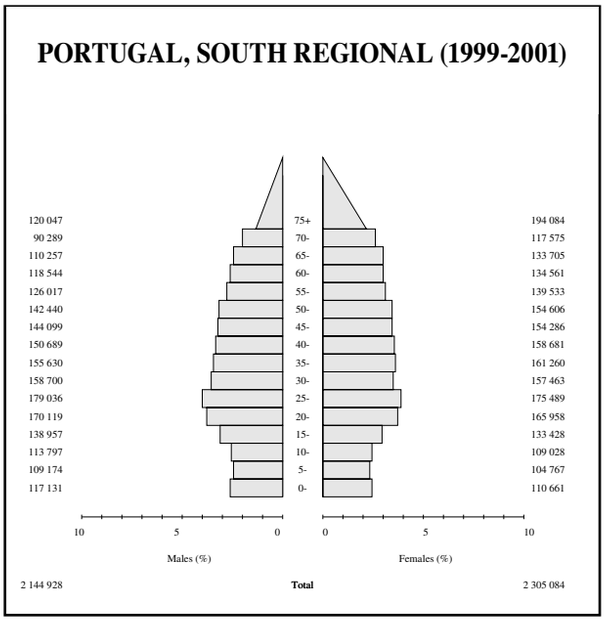
Notes on the data
The Editors recommend that some care be taken in the interpretation of these data; see Chapter 5 (Categorisation).

Portugal, South Regional

Registration area
The South Regional Cancer Registry (ROR-Sul) is the population-based cancer registry responsible for cancer registration in the south of Portugal. Its area of activity includes the Lisbon area, Alentejo and Algarve regions, and Madeira Autonomous Region, covering approximately half of the country (39 700 km^2) both in terms of area and population.

According to the end-of-year 2001 estimates, ROR-Sul has 4 490 491 inhabitants, 17.5% of them aged 65 or more. Of these, 45% live in the Lisbon region (capital of the country and suburbs). Birth rate in 2001 was 10.9%, and life expectancy was 73.5 for men and 80.3 for women.

The occupational distribution by economic sector in the 2001 census was distributed as follows: 5% agricultural, 35.1% industry and construction, and 59.9% services.



Cancer care facilities
General health care in the region is provided by 40 public general hospitals, one university hospital, a network of 147 primary health care centres and Lisbon's Cancer Institute. There is one general practitioner per 2000 inhabitants. Almost all cancer patients are diagnosed and treated by medical specialists working at the hospitals.

Registry structure and methods
South Regional Cancer Registry began operation in 1989 as part of a programme for nationwide cancer registration, and is financed by public health funds.

Since 2000 there has been a registry network; data are collected by laptop computer from all hospitals and health centres, and by means of standardised paper forms for private hospitals and pathology labs and for annual follow up. The laptop is under the control of one clinician at each site. The Registry network server is located in Lisbon's Cancer Institute.

The permanent staff of the Registry network includes two physician specialising in epidemiology, one of them as head of the registry, three statisticians and ten tumour registrars. In addition, two consultants—one pathologist and one oncologist—are available.

The Registry is based on compulsory reporting of all new cases since 1988. The first tumour identifier is the pathology report from all hospital and private pathology labs. Necessary information is abstracted from the medical records in each hospital or health centre by trained tumour registrars or local physicians and entered into the central server via the network. In addition, hospital discharge files of cancer patients, and hospital pharmacy and radiotherapy service records are compared with registry database, and all the cases not in the registry are reviewed.

Site and morphology codes have been coded according to ICD-O-3 since 2000. The rules used for coding multiple tumours are those proposed by IARC/IACR. For the staging of tumours, the TNM classification is used.

Completeness of records, data consistency and duplicate records are continuously and extensively checked using the IARC-Check program, other specific computer program developed in the registry, and by reviewing a sample of cases.

Arrangements have been made with the other two Regional Cancer Registries in order to exchange information on those resident cases diagnosed and treated in hospitals outside the registration area.

Patient follow up is carried out every year by checking death certificates.

Use of the data
The main purpose of the registry is to estimate cancer incidence in the region, and annually the registry prepares a report on incidence. In addition some case–control studies have been carried out.

The registry also participates in several national and international research projects, including EUROCARE.

The registry is the recognised regional source of information on cancer incidence. There are often requests for information from physicians, politicians, journalists and interested organisations.

Source of population
The estimates of population–at–risk are based on the 1991 and 2001 Censuses, making allowance of births and deaths. It was not possible to estimate migration into and out of the registration area.

Multiple primary rules used
IACR rules (2000) on CI5 IX period.

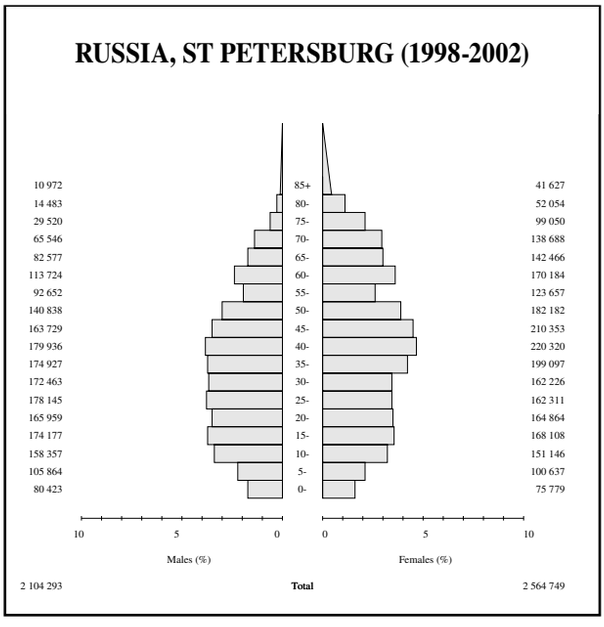
Russia, St. Petersburg

Registration area
St. Petersburg is the second largest city in Russia and one its biggest industrial, scientific and cultural centres. It was founded in May 1703, and in 1914 its name was changed to Petrograd and in 1924 to Leningrad. It was the capital of the state from 1712 to 1728 and from 1732 to 1918. St. Petersburg is situated at the point where the Neva River flows into the Gulf of Finland and includes 42 islands of the Neva delta. The climate is of a maritime type with mild winters, rather cool summers, and very changeable weather. The average temperature in January is -7 -9° C, in July +17.7° C. The annual precipitation is 585mm and the total area is 570 km^2.

The main occupations are heavy industry, especially heavy engineering (energy engineering industry, machine-tool construction, shipbuilding). In 2000 the total population was 4 660 792.

The mortality rate for all causes in St. Petersburg in 2000 was 16.3 per 1000 inhabitants, and the average life expectancy in 2000 was 66.0 years.

The national structure of the population in St. Petersburg according to the census of 2002 was 3949.6 thousand Russians (84.7%), 87.1 thousand Ukrainians (1.9%), 54.5 thousand Belorussians (1.2%), 36.6 thousand Jews (0.8%) and 35.6 thousand Tatars (0.8%).



Cancer care facilities
There are three medical institutes and two advanced training institutes for doctors, as well as a large number of clinics and hospitals. Some of the patients come from other parts of the country. Treatment of cancer patients is carried out mostly in the City oncological dispensary at the Professor N. N. Petrov Research Institute of Oncology, or in a number of oncology departments in large general hospitals. The total number of oncological beds is 1252, including 428 radiological and 75 paediatric. Ordinary hospitals and clinics treat 40% of oncological patients.

Since 1953 in Russia there has been an established state system of oncological services (cancer control). Each administrative territory has its own centre (an oncological dispensary) with 200 to 1000 beds depending on population. This oncological centre provides all three components of curative treatment (surgery, radiotherapy and chemo-hormonotherapy). In general this therapy is free of charge using federal funds as well as funds of obligatory medical insurance.

Registry structure and methods
The General process of registration is the same as that used across the whole territory of the ex-USSR. A doctor who detects a cancer patient must send a notification card to the oncological dispensary or the cancer registry for the region of residence of the patient. On the basis of this card and other supporting documents a control card is compiled and entered into the computer. The data of the oncological dispensary are checked regularly against those of the statistics department, which is responsible for registering cancer deaths.

Interpreting the results
There are screening programs, but since 1991 they have been performed less actively. PSA testing is used but not widely because of financial difficulties.

Use of the data
Information about all cancer patients and about deaths is included in special tables, which are sent to the Russian Ministry of Health annually.

N. Toichkin made the first evaluation of cancer rates in St. Petersburg in 1912. His research was based on the cancer mortality rate of 93–99 per 100 000 inhabitants in St. Petersburg from 1901 to 1910, which he obtained from the municipal statistics department.

In 1926 N. N. Petrov initiated an institute of oncology in St. Petersburg, which was later named after him. Obligatory registration was attempted in St. Petersburg in the 1930s and was permanently adopted after the Second World War. Epidemiological research is carried out in the Petrov Institute of Oncology, including a study of cancer incidence in different areas of the ex-USSR.

Annually we publish 1–2 editions on morbidity and survival. Additionally we systematically take part in different conferences and have TV and radio presentations. Data of the Cancer Registry are systematically presented to the local government, and they are taken into account in developing the organisation of oncological services to the population. Our suggestions to develop establishment of further cancer registries are accepted in a draft of the Order of the Ministry of Health concerning improvement of oncological services in Russia.

Source of population
Official governmental estimates based on the 2002 census. (Committee on Statistics of St. Petersburg).

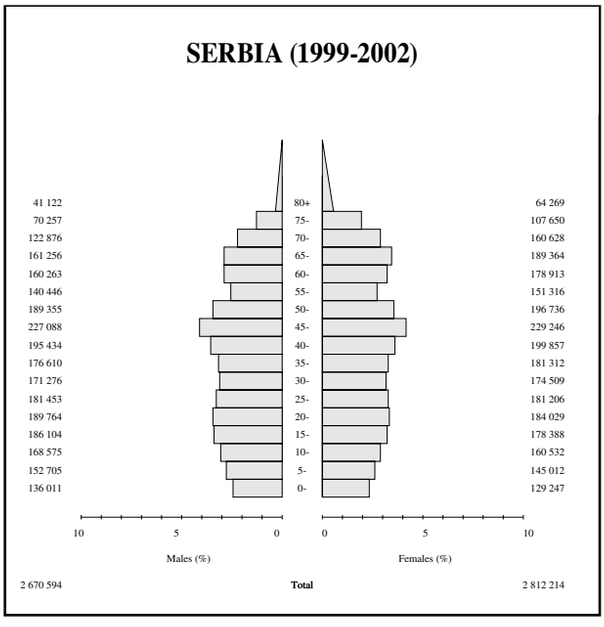
Multiple primary rules used
IACR rules (2000) on historical data.

Serbia

Registration area
The Population Register for Cancer was formed in Serbia in 1970, originating from the Plan of Statistical Research of Interest for the Republic of Serbia. In the 1990s the data quality and the functioning of the registry greatly improved.

The Central Serbia Cancer Registry covers an area of 55 968 km^2, and had a population of 5 484 920 (June 2000 estimate). About half live in urban areas (48.7% male, 51.3% female); 90% are Serbs and 60% are Orthodox Christians. Central Serbia includes 18 districts, in the central part, within the Republic of Serbia, divided into 115 municipalities.

Cancer care facilities
Notification of neoplasms is mandatory by law for every physician who diagnoses or treats a malignant tumour. Information sources concerning new cancer cases/ deceased cases are data from the oncology institutes, oncology dispensaries, oncology clinics, hospitals and outpatient health institutions, pathohistology/cytology, haematology and other laboratories, death reports, health insurance funds and targeted researches. The notification is sent to a regional Cancer Registry located in the Institute of Public Health of Serbia.



Registry structure and methods
In 1986, with the aim of applying a unified Registry methodology in all territorial units of the Former Yugoslavia, the Guidelines On Ways And Procedures Of Reporting Persons With Malign Neoplasms, the Regulation Book For The Register Form And The Method Of Updating, The Report Forms And Reporting And Cancelation Procedures For Certain Diseases were adopted.

Imprecise guidelines, insufficient education of medical personnel, and a lack of informatics support resulted in the under-registration of newly found cases of cancer, as well as relatively poor data quality on the report forms themselves. Starting from legal obligations and role of the Registry, the reorganisation of the Register began in 1996, in accordance with the recommendations of the International Agency for Research on Cancer (IARC), and European Network of Cancer Registries (ENCR). The reorganisation encompassed: decentralisation (registers are formed on a regional level, while the main database for Central Serbia is located in the Institute of Public Health of Serbia), active data collection, new sources of information, education of medical personnel, informatics support and a feedback system. In 1998, due to this successful reorganisation, the Central Serbia Cancer Registry was admitted into the IACR.

The Central Serbia Cancer Registry includes the following data: personal characteristics of new cases/ deceased, possible appearance of multiple primary tumours, date of determination of current illness, diagnostic methods, tumour characteristics (primary and secondary anatomy localisation, histology type, stage), outcome of the disease, as well as data on the health institution reporting the tumour.

Interpreting the results
Since 1994 the diagnosis, cause of death and morphology have been coded using ICD-10, and according to the ICD-10 and ICD-O-2 (1998) and ICD-O-3 (2001). The Register does not include *in situ* tumours (codes D00-D09), but includes clinical stage *in situ*.

The Register is supported by the CanReg3 (1998) and CanReg4 (2001) programme packages.

With the aim of providing quality in collection, entry, keeping, processing and analysis of data in the Registry, the methodology of international associations was applied (IARC I ENCR) for cancer registers.

Use of the data
Following the aforementioned activities and the several years necessary for achieving stability of the data, conditions were created for issuing the first Report in December 2001.

Unpublished data of the Republic Statistics Institute were used for the analysis of death due to malignant tumours in Central Serbia.

Apart from crude rates, the Report includes standardised incidence and mortality rates on World population. These rates were standardised by the method of direct standardisation, with the World, European or truncated population as the standard population. Registry data calculated and analysed at the Center of Prevention and Control of Noncommunicable Diseases have been used for the purposes of descriptive epidemiology.

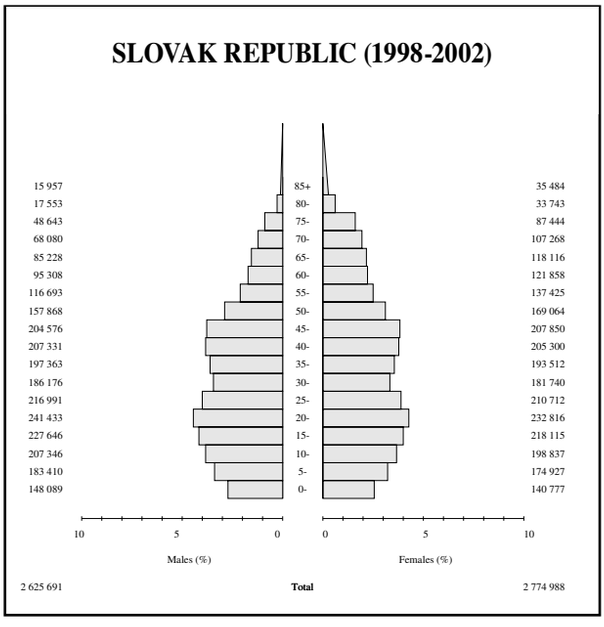
The percentage of new malign tumour cases registered on a death report only basis, as well as the percentage of histologically and cytologically-verified malignant tumours of the total number of reported cancer cases, were the foundation for the evaluation of Registry data quality.

Source of population
The populations for 1999, 2000 and 2001 are estimates provided by The Statistical Office of Republic of Serbia. The estimated populations were an extrapolation from the 2002 census assuming linear growth in every age and sex group.

Multiple primary rules used
IACR rules (1990 and 2000).

Slovak Republic

Registration area
The National Cancer Registry of the Slovak Republic covers the whole population of the Slovak Republic, with 5 400 679 inhabitants (2 625 691 males and 2 774 988 females) in 2000. The Slovak Republic is divided into 8 regional units and 79 districts and covers an area of 49 035 km^2, with a perimeter of 1672 km and a population density of 110.1/km^2. In 2000 nearly 13% of the inhabitants lived in the two bigger cities, Bratislava and Košice. Twelve percent lived in another nine towns with 50 000–100 000 inhabitants, 30.4% in communities and smaller towns of 5000–49 999 inhabitants, and the remainder in villages with fewer than 5000 inhabitants. In 2000 the majority of the working population was employed in industry and agriculture (37.8%), the remainder being employed in building and service industries, research and trade. In 2000, employees in the Slovak Republic could be divided by education into four categories: basic (9.1%), trained (29.2%), secondary (48.8%) and university (12.9%). The majority of the population is of Slovak nationality, the second most numerous group being Hungarian. Unemployment was 18.3% in 2000, but 9.6% at the end of 2006.



Cancer care facilities
In 2000 there were 95 hospitals in the Slovak Republic. There were 92 public (state) hospitals and hospitals with polyclinics (7 university hospitals, 79 hospitals and 6 psychiatric hospitals) and 3 private hospitals. Cancer care at the highest level is provided by the St Elisabeth Cancer Institute and the National Cancer Institute, both in the capital of Slovakia. There are oncology and radiology departments at the university and most of the county hospitals. The peripheral network of oncology outpatient clinics is oriented to registration and notification of diagnosis, active lifelong follow-up and providing treatment for cancer patients. The creation in 2000 of the Eastern Slovak Cancer Institute has also contributed to improving high-level cancer care and, in general, the quality of diagnostic and treatment services for cancer patients is gradually improving.

Registry structure and methods
The National Cancer Registry of the Slovak Republic is a population-based cancer registry established in 1976. It covers the entire population of the country and collects cancer data from the year 1968 onwards.

Cancer reports and death notification forms are used for data collection. The registry has had its own computer centre since 1990. In 2005 it moved from the National Cancer Institute to the National Centre for Health Information, Bratislava. The staff of the registry now consists of one epidemiologist, one full-time and four part-time physicians (oncologists and pathologists), seven registrars and one computer specialist. Notification of cancer is compulsory, and all physicians have three months to complete the notification forms.

The registry notification form is completed in the district oncology outpatient clinics. Further information from the clinics is provided about change of name, address, diagnosis and about the death of any cancer patient. In the registry each newly notified patient is compared and checked with the main file of patients already registered to ensure proper registration of new primaries and elimination of duplicates. All death certificates (all causes of death) are regularly reviewed to ensure the inclusion of previously unregistered cases and consequently to include DCO cases.

The National Cancer Registry database is annually reconciled with the database of hospitalised patients (established by the Ministry of Health). If any cancer report is missing, it is searched for and requested of the provider.

The completion of dates of death is now also assessed using data from the Office for the Evidence of Population of the Slovak Republic. Since 1990, the registry has received considerable information about cancer patients from other documents accompanying the notification form (discharge summary, hospital record, operation report, results of histology or cytology and autopsy report).

Interpreting the results
There was no national screening programme in 1998–2002, although screening for colorectal cancer was introduced in 2002 and PSA testing is widely available. An increase of *in situ* cervical cancer and a decrease in breast cancer mortality despite increasing incidence would suggest the existence of some screening programmes or at least an improvement in diagnosis and health education. The national screening programme for cervical cancer became available in 2007.

Use of the data
Annual reports have been published regularly since 1983. The annual report contains detailed data on cancer incidence in Slovakia, including sub-regions, and is distributed to all the health institutions of the country (Ministry of Health, central institutes, hospitals, centres of clinical oncology, public health institutes). The data are used for policy preparation for cancer care and prevention, as well as for planning facilities for the diagnosis and treatment of cancer patients. Recently these data have been increasingly used by the National Centre of Health Promotion and by the Slovakian League Against Cancer, mainly for health education of the population in the field of cancer prevention.

The data are also used for many other international collaborative projects.

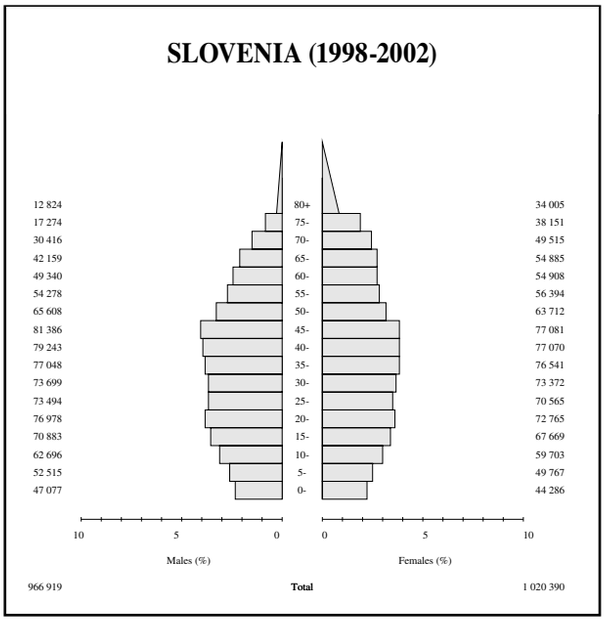
Source of population
1998–2000: estimates. 2001: Census. 2002: estimates (Statistical Office of the Slovak Republic).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Slovenia

Registration area
The Cancer Registry of Slovenia covers the entire population of the Republic. The population at the most recent census (2002) was 1 964 036. About 50.8% of the population lives in urban areas (>3000 inhabitants); 83.1% are Slovenians, 2.0% Serbs, 1.8% Croats, the remainder other nationalities, mainly from neighbouring countries and countries of former Yugoslavia. The prevailing religion is Roman Catholic, and 84.7% of population is aged 15 years or over.

Cancer care facilities
Health care centres and private practitioners provide primary and outpatient secondary health care; most of them are included in the public health care network. There are 12 general hospitals and Clinical Center in Ljubljana as a tertiary healthcare facility. The Institute of Oncology, founded in Ljubljana in 1938, is the only Slovenian national comprehensive cancer centre. Besides patient care, it is involved in research and education in the framework of the University of Ljubljana Medical Faculty. Common cancers are treated in general hospitals, though the Institute of Oncology is the referral centre for rare cancers. Except for skin cancer, radiotherapy is administered only there. About half of cancer patients are admitted to the Institute at some time during their illness.



Registry structure and methods
The registry was founded in 1950 and is located at the Institute of Oncology Ljubljana. Notification of cancer has been compulsory since the beginning and is prescribed by law. In 2003, the Registry was merged with Epidemiology Unit in a single service, Epidemiology and Cancer Registries, which also comprises, the hospital-based Cancer Registry of the Institute of Oncology, Epidemiology Unit for epidemiological studies and Cervical Cancer Screening Registry, which coordinates, monitors and evaluates the nationwide organised cervical cancer screening program, introduced in 2002. The Registry is staffed by two full-time medical doctors, specialising in epidemiology and public health, a junior researcher in statistics, 4 registrars, a computer operator and part-time system analyst. Other staff are involved in screening and other work.

The main sources of data are notifications gathered from all hospitals and diagnostic centres in Slovenia, and exceptionally from primary health care centres in cases in which the patient was not referred for further diagnostic investigations. Death certificates and autopsy protocols stating cancer diagnosis supplement this information. When needed, requests are sent to notifiers to ensure accurate information as well as to the hospitals or doctors who signed the death certificates in case the patient had not yet been registered. Trained registrars, supervised by a physician, perform coding of the information. Case identification is based on a personal identification number that also enables accurate follow-up of patients for death by regular linkage of our data to the Central Population Register. Data protection regulations are strictly respected.

Interpreting the results
The small and stable proportion of cases registered after the publication of annual reports (about 4%) shows that the majority of cases are reported to the Registry by the time of publication. The registration of patients treated in the outpatient department only (e.g. non-melanoma skin cancer, multiple myeloma, chronic lymphatic leukaemia, as well as prostate cancer) is incomplete.

There are no official data on PSA testing, but it is becoming very popular among urologists. It is not paid to general practitioners by health insurance.

Use of the data
Annual reports on cancer incidence have been published since 1951, since 1965 in Slovenian and English. The data collected serve as the basis for assessing the national cancer burden, for programming and evaluation of primary prevention, diagnosis, treatment and rehabilitation, for programming and evaluating primary prevention, diagnosis, treatment and rehabilitation, planning facilities and funding needed for cancer control (personnel, equipment and hospital capacities) as well as for clinical and epidemiological research in Slovenia and in international multicentric studies. The results of our studies are published in national and foreign medical literature and as publications for lay readers.

Our data have been published in all eight volumes of the Cancer Incidence in Five Continents. The data on cancer incidence and mortality for the years 1983–99 were also included in the international databases EUROCIM, GLOBOCAN, ACCIS. The survival of Slovenian cancer patients is included into and analysed by the international studies EUROCARE II and EUROCARE III.

Source of population
Official number of the population as at 30 June provided by the Statistical Office of the Republic of Slovenia based on the Central Population Register of the Republic of Slovenia.

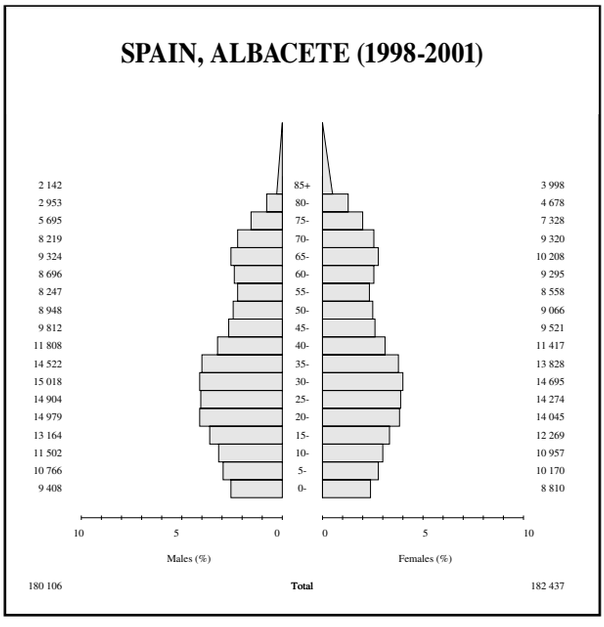
Multiple primary rules used
IACR rules (2004) on historical data.

Spain, Albacete

Registration area
Albacete is situated in the Central Meseta in the southeast of Spain. The province consists of 87 municipalities, 67.5% of which have fewer than 2000 inhabitants and only 5.9% have more than 10 000. The climate is Mediterranean temperate with some continental features. The average total annual rainfall is approximately 275mm.

The size of population covered by the registry at mid-year 2000 was 363 263 inhabitants. The population density (24 inhabitants per km^2) is very low compared to that of the country as a whole. Of this population, 15.5 % live in rural areas of fewer than 2000 inhabitants, 24.5% in semi-rural areas of 2000-10 000 inhabitants, and 60.0% in urban areas.

The ethnic/racial composition that our Registry covers is practically all white. Only in recent years have immigrants accounted for 3–5% of the population, and these are generally young people with low risk of cancer.



Cancer care facilities
Six hospital centres are located in the province, three of which are private surgical hospitals and three public general hospitals. There is one private pathology laboratory. There are 34 public primary care centres. Almost all of the population is covered by the public health system (SESCAM).

Data for the registry are obtained from the General Hospital of Albacete (pathology and haematology laboratories, oncological and medical records departments); the Local Hospital of Hellin (pathology and haematology laboratories and medical records); the hospitals N^a S^a de los Llanos; Santa Cristina, Virgen del Rosario and Clinica de Recoletas; the Dr lñiguez de Onzoño pathology laboratory, the Provincial Office of SESCAM, the regional mortality register and the National Institute of Statistics.

In general our area has a good availability of diagnostic and treatment services, but the radiotherapy department did not begin operation until the year 2002.

Registry structure and methods
The Cancer Registry of Albacete was created in February 1990 by the Consejería de Salud de la Comunidad Autonoma de Castilla-La Mancha, and it belongs to the Regional Service of epidemiology with the principal objective of analysing cancer incidence in the province. It is financed by the Comunidad Autonoma. Our Registry currently employs 2 doctors and a nurse.

Data collection is active, carried out by the personnel of the registry from lists provided by the sources, and by consulting the files and clinical records concerned. The registry records cases voluntarily notified by physicians in the primary care services.

No active follow-up of cases is carried out. The registry has access to death certificates mentioning cancer for local residents who die in the Autonomous Community. Death certificates are traced back to find further information if the case is not already registered, and if no further information is found the case is registered as death certificate only. There is no personal contact with patients or their families.

All data are automatically processed using a system, which includes checking for duplicate registrations by name, social security number or clinical record. Cases are coded by ICD-O topography and morphology. Multiple tumours are coded following the IARC/IACR recommendations. The CHECK program is used to detect errors and discrepancies in the data.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but it probably does occur for elderly subjects in rural areas. SESCAM has a full range of diagnostic facilities, so it is unlikely that cases referred will be missed. A screening service for breast cancer is operated by the Asociación Española contra el Cáncer since 1991. Use of PSA tests is opportunistic and of an unknown extent, but in general it is not uncommon.

Use of the data
The registry prepares an annual report of cancer incidence by site, sex and age. The registry also participates in analytical epidemiological investigations. Policymakers use our cancer registry data for planning or evaluation of health services, especially in breast cancer screening programme and the regional cancer programme.

Source of population
Census: Instituto Nacional de Estadistica (http://www.ine.es).

Multiple primary rules used
IACR rules (1990).

Spain, Asturias

Registration area
The Asturias cancer registry covers the whole Principality of Asturias, a Spanish Autonomous Community of 10 565 km^2 located on the northern coast of the Iberian Peninsula. This well-defined region lies between latitudes 42º and 43º N and longitudes 4º and 7º W.

In 2000 the total population was 1 076 567 inhabitants. Of these, 21.4% were aged 65 or more, and 60.4% lived in the central urban area of Asturias but only 43.4% in cities of more than 100 000 inhabitants. The population density that year was 101.53 inhabitants per km^2.

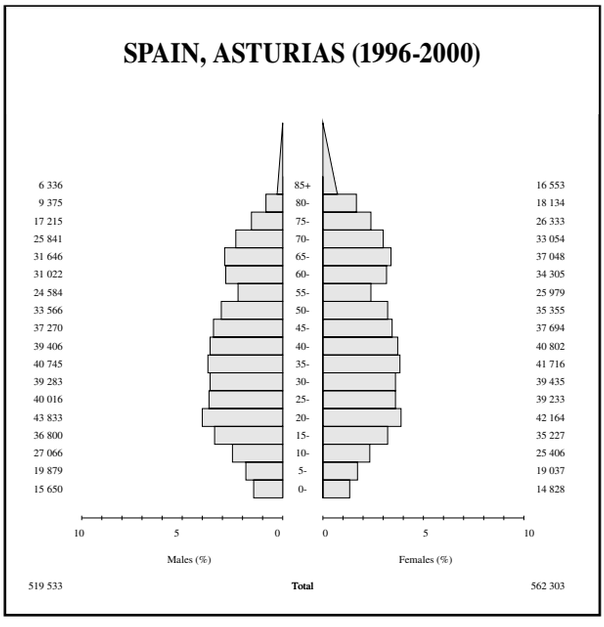
In 2000 the unemployment rate was 16.4% in Asturias, and the distribution of occupation by sector was 10.2% in agriculture and fishing, 16.9% in industry, 11.8% in the building sector and 61.1% in services.

The prevailing religion in Asturias is Roman Catholic.

Cancer care facilities
General health care in Asturias is provided mostly by public services through a well-developed network that comprises 8 district hospitals, 220 urban and local primary health care centres, and Central Hospital in the capital (Oviedo), home to a comprehensive oncology centre that offers cancer surgery, radiotherapy and chemotherapy services. Patients suspected to have cancer are diagnosed and given treatment in the 8 health districts and referred to Central Hospital when required. These facilities are supplemented by one private hospital that offers some cancer treatments. Very few cancer cases require additional treatment outside Asturias.

Registry structure and methods
The registry was initiated in 1978 and become population-based in 1982. It is located in Oviedo and since 1981 has been funded by a Public Health Directorate from Asturias Health and Health Services Council, a government body in charge of planning and providing health care and public health services to the whole Asturian population. The registry staff comprises one part-time epidemiologist and two full time registrars.

The registry uses active casefinding from different sources including public and private hospitals, pathology and haematology laboratories and death certificates to identify cancer cases diagnosed among the residents of Asturias. There is also a hospital-based registry in Central Hospital, which provides computer files to the registry. Cancer is not a notifiable disease in Asturias.



Interpreting the results
From 1998 to 2000 an organised breast cancer screening programme was implemented in Asturias covering women aged 50–64, reaching a 60.5% participation in the first round.

Trends in prostate cancer incidence should be evaluated with caution because the impact of opportunistic PSA screening.

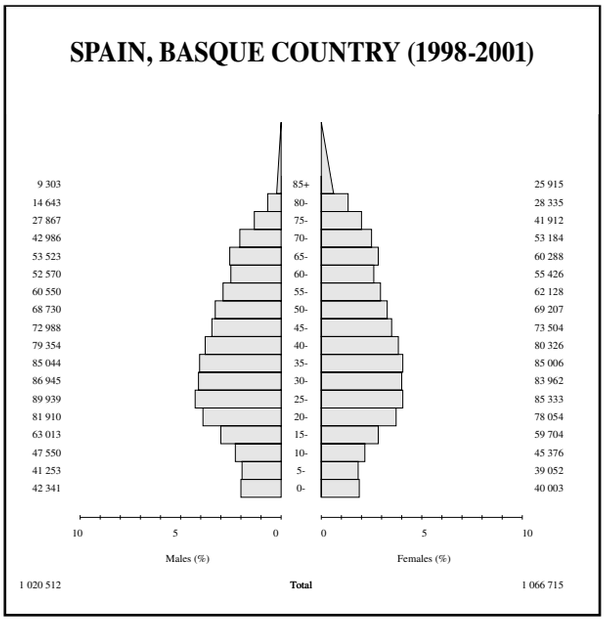
Use of the data
The registry publishes regular reports on cancer incidence. Data from the registry have been used for etiological research in the EPIC cohort, evaluation of breast cancer programmes, and to plan radiotherapy facilities and other cancer services.

Source of population
Census data (INE 2006).

Multiple primary rules used
IACR rules (2004) on historical data.

Spain, Basque Country

Registration area
The area covered by the Basque Country Cancer Registry (BCCR) is the Autonomous Community of the Basque Country, an area of 7261 km^2 situated in northern Spain between latitude 40°27' and 42°28'N and longitudes 1°44' and 3°26'W. It consists of three provinces: Alava, Bizkaia and Gipuzkoa. At the 2001 census, the total population was 2 082 587, of whom 17% were over 65 years old. The population density is 286.8 persons/km^2. About 28% of the population live in rural municipalities. The employment of the active population by sector is: services sector 62%, industry 27.5%, building activity 8.7% and agriculture 1.8%. The prevalence of smoking in men and women is decreasing: 31% and 21% respectively. The proportion of immigrants was low but increasing. Most of the population is Roman Catholic.



Cancer care facilities
General health care in the region is provided by the Osakidetza, the public Basque Health Service, to 95% of the population. There are 40 hospitals (public and private, one of them devoted to cancer treatment) excluding the psychiatric ones, and approximately 4 beds per 1000 inhabitants. Most cancer patients attending the network of primary healthcare centres are referred to medical specialists at the general hospitals with oncology facilities. Over the last 10 years the number of radiology facilities for cancer diagnosis and treatment as well as the number of oncology specialists has increased in both the private and the public system.

Registry structure and methods
The Basque Country Cancer Registry was created in 1986 by the Department of Health. The main aim was to determine cancer incidence and its characteristics in the Basque Country, to provide information for the planning of cancer services and preventive activities, and to facilitate epidemiological research.

A major reorganisation of the Cancer Registry has taken place since 1995. In each province a team was defined and five hospital cancer registries were established. The coordination of the BCCR remained in the Health Department (Vitoria-Gasteiz), where a computer technician and one epidemiologist were assigned part-time to the registry. Previously registered cases were converted from ICD-O-1 to ICD-O-2 with IARCtools, and a new data management application was developed. The head of the provincial team, an epidemiologist partially assigned to the registry, and several administrative registrars have the hospital registries as the main sources of information. Notification is voluntary. An active system of data collection from other sources has been established, and cases are abstracted from clinical records and entered in the computer. Data from incident cases are complemented by death certificates mentioning cancer (pre-1996) and all death certificates since then. A case is registered as Death Certificate Only when no further information has been obtained after looking for information in the sources. Checking for duplicates is routine, and the IARC-Check program is used periodically. Arrangements have been made with cancer registries outside the registration area to notify the BCCR of any resident cancer cases they diagnose or treat.

Interpreting the results
Rates from 1986 to 1994 were converted from ICD-O-1 to ICD-O-2. Since November 1995 there has been an organised breast cancer screening programme in the Basque Country covering women aged 50–64 years.

There is no population-based cervical screening programme, but there is opportunistic screening mainly in women at higher risk. The large increase in prostate cancer in recent years can be related to the use of PSA by general practitioners and specialists since 1998.

Use of the data
A report with descriptive results of the registry is published in an annual report by the Basque Health Department. Information provided by the registry is used for planning and evaluation of health services. Survival has been studied in the framework of the EUROCARE study.

Data have been used for the evaluation of the breast screening programme and in several collaborative studies such as EUROCARE, Europreval, ACCIS and EPIC among others. In-house studies include several cancer sites and their relation to health services, and evaluation of coding to implement a semi-automated programme.

Source of population
Estimate of the population at risk is based on the 1996 and 2001 censuses without taking into account immigration into or out of the area.

Multiple primary rules used
IACR rules (2004) on historical data.

Spain, Canary Islands

Registration area
The archipelago of the Canary Islands is one of the autonomous regions of Spain. It is located 100km east from the African coast and 1500km from mainland Spain, between latitude 27º and 30º N.

The Registry covers the population of the two major islands (Gran Canaria and Tenerife), which are the administrative capitals of the two provinces. Those two islands had a population at mid-year 2000 of 1 474 802 inhabitants (population covered by the registry).

The population is almost 100% Catholic although there are some people from India who have lived in the islands for generations. In recent years, especially in 2001 and 2002, the islands have undergone a strong immigration phenomenon, mostly from South America.

The economic activities are agriculture (7%), industry (3.4%) and services, mainly tourism (77.9%).

Cancer care facilities
There is a network of primary health care centres and two reference hospitals in each island with services of oncology, radiotherapy, haematology and cancer surgery and chemotherapy.

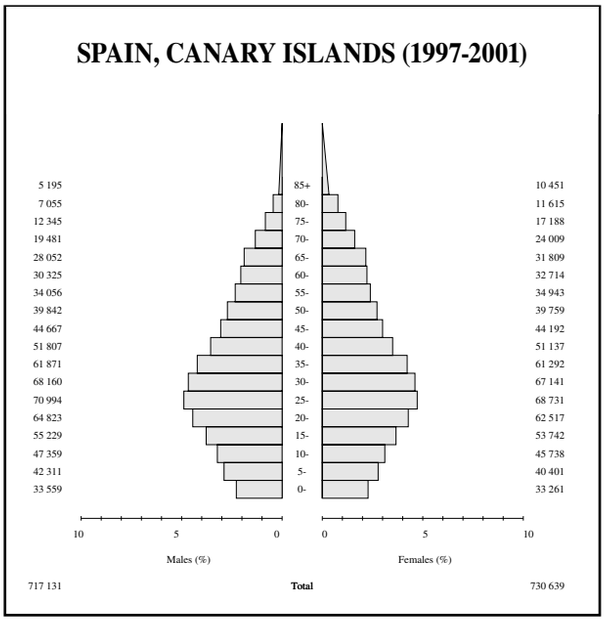
Registry structure and methods
The registry belongs to the Public Health headquarters and is part of the Epidemiology Service. Each island has a team of 2 medical doctors, 2 nurses and 1 clerk.

The Registry actively collects data from public and private sources. Registrars search for cases at pathology, oncology, radiotherapy, and haematology services, in inpatient records and hospital cancer registries, as well as in private pathology laboratories and among death certificates with cancer as primary cause of death.

If necessary, patient medical records are verified by the originating hospitals, either to confirm the incidence date, method or tumour site. Since 2006 we have had internet-based access to the records of the 4 major hospitals, which has been an excellent tool.

Some patients go to hospitals in mainland Spain for treatment, but most diagnoses are made in the islands, and in any case many of these are collected via death certificates, so we believe the registry completeness level is acceptable.

Interpreting the results
There is an organised screening programme for breast cancer in women aged 50–64 years from, and opportunistic screening for cervix and prostate cancer. PSA testing is common in the population.



Use of the data
The registry publicises an annual report of incidence with the cases of one given year, available online at: http://www.gobiernodecanarias.org/sanidad/scs/3/3_5/cancer/ppal.jsp.

The data are used continuously by health managers in health planning for the hospitals and government. The Registry has also conducted some other studies in cancer mortality, and collaborates with several investigations of colorectal, breast, cervix and thyroid cancer and melanoma.

Source of population
1998 Census. Geometrical interpolation between 1996–1999. 1999–2001 Census. Geometrical interpolation between the population on the first day of January of the year, and the population on the first day of January of the next year.

Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C67 includes only invasive tumours.

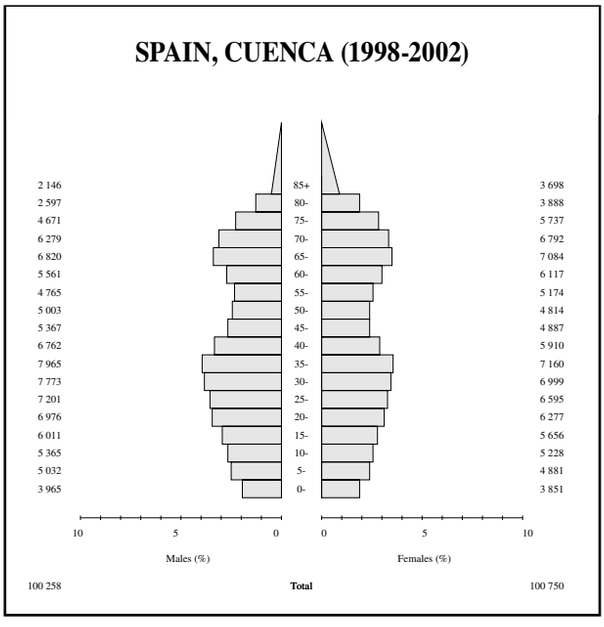
Spain, Cuenca

Registration area

The population-based Cancer Registry of Cuenca was created in 1993, within the Epidemiology Service of the Health Department of the Autonomous Community of Castilla-La Mancha.

The area covered by the Registry is the Cuenca province, located between 40°33' and 39°35' N latitude, corresponding to the Spanish Central Plateau.

The population (according to the 2000 census) was 201 060 inhabitants (100 127 males and 100 933 females), including 1289 immigrants; 44% live in rural areas (<2000 inhabitants). Some 25% are older than 65 years, and 14% are under the age of 15. The province covers 17 140 km^2 (238 municipalities), at a population density of 11.7 inhabitants/km^2. The economic activity rate for the population aged 16–65 is about 50%. Economic activity is developed in the services sector (45.1%), in agriculture (25.2%) and in industry and construction (29.7%).



Cancer care facilities

In the registry area there are a public hospital (with 90% of the beds) and a private hospital. In the public hospital, there is an oncology service where chemotherapy is provided, and a surgery service that serves cancer patients. Patients are sent to referral centres for radiotherapy. There are 37 public Primary Health Care Centres covering the province.

Registry structure and methods

The personnel devoted to the Cancer Registry of Cuenca are two physicians, three nurses and a clerk (all part-time).

Data collection is carried out actively by the personnel of the Registry through the review of clinical histories in the hospital or in the Primary Health Care Centres. The registry receives the automated discharge files and the computerised pathology reports from the public hospital. Furthermore, we receive individualised information from the cases treated by general practitioners, and from the hospital physicians who attend patients with cancer, as well as information from death certificates. There is an organised screening programme for breast cancer that also informs us of newly diagnosed cases.

The principal objectives of the Population Cancer Registry of Cuenca are:

1. To know the real incidence of the Cancer in our province, as well as its distribution by age, sex, morphology and topographic site of the different tumours.
2. To compare our incidence with that in other registries in Spain and other countries.
3. To know the temporal evolution of cancer incidence in our province.
4. To know survival rates in cancer patients and their temporal evolution.
5. To contribute to improving and encouraging epidemiological investigation, preventive measures and sanitary care in oncology patients.

Material and methods

All malignant tumours diagnosed from 1 January 1993 in persons residing in Cuenca at the moment of diagnosis are eligible for the RCCU. Furthermore, following WHO recommendations, we register all bladder tumours, independent of their behaviour. Basal and squamous cell skin cancers are not registered.

The data are automatically processed using a system that includes checking to avoid duplication, such as surnames, Social Security number and Clinical History code. We use the CHECK program to detect errors and inconsistencies between the different variables.

Cases are codified according to the ICD-O-2, following the recommendations of the IARC to classify multiple primary tumours as well as to register the different variables (incidence date, diagnosis basis). Access to patient data is restricted to Registry personnel.

Use of the data

The registry publishes a report of cancer incidence from 1993 to 2002, highlighting trends, evaluating survival and making geographical comparisons. Our registry is also taking part in the Regional Plan Oncology in Castilla–La Mancha. The registry also participates in a national research project about rare tumours.

The information obtained was used to produce three incidence posters at the National and Regional Epidemiology Annual Conference.

The data will also be used to measure the effect of the breast cancer screening programme.

Source of population

Updated information from the municipal registers of inhabitants for each year published by the Instituto Nacional de Estadistica (INE http://www.ine.es), except for the population aged less than 1 year in 1998, which was calculated based on annual growth.

Multiple primary rules used

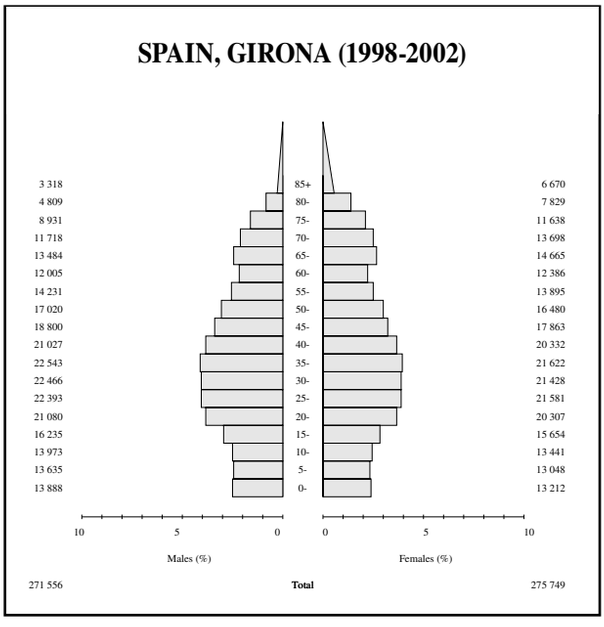
IACR rules (2000).

Spain, Girona

Registration area

The Girona Cancer Registry covers the population of Girona Health Region, located in the north of Catalonia in the northeast of Spain. The population at the most recent census (2000) was 538 139. The area covered by the registry is divided into 209 municipalities, with Girona city the largest (approximately 86 672 inhabitants). Within this region, about 57% of the population live in urban areas (>5000 inhabitants).

The population in Girona province is ethnically very homogeneous, with the majority of the population being Caucasian. However in recent years there has been a huge increase in immigration from Africa. According to the 2001 census in the province of Girona, 7.7% of the population are immigrants, originating from other European countries (1.8%), Africa (4.0%), South America (0.85%) and Asia (0.26%).



Cancer care facilities

Health care is provided predominantly by the National Health Service through the district hospitals and a network of primary health care centres. There are nine public hospitals with 1087 beds and three private hospitals with 233 beds (2.45 beds per 1000 inhabitants). Medical specialties concerning cancer treatment include radiotherapy, cancer surgery and chemotherapy and are carried out at different general hospitals but coordinated by the reference cancer centre in the city of Girona (Catalan Institute of Oncology-Hospital Universitari de Girona "Dr. Josep Trueta") which has radiotherapy facilities at its disposal. Some cancer patients may be diagnosed in hospitals located in Barcelona (100km from Girona), and the cancer registry also covers such sources of information.

Registry structure and methods

The Girona Cancer Registry began its activities in 1995. It is funded by the Department of Health of the Catalan Government and is carried out by the Catalan Institute of Oncology.

The staff is composed of a director, an oncologist as a coordinator, an epidemiologist, a technical registrar and a clerk. Several oncologists, hematologists, pathologists, computer scientists and statisticians are external collaborators.

Notification of cancer is voluntary. Data collection is active, from 21 sources consisting of general hospitals and pathology laboratories. Data are obtained mainly from admission services and medical records, as well as from pathology, oncology and haematology departments. The death registration system is adequate and complete; every year the registry analyses all death certificates. The registry staff visit the sources, where they check medical records and database of individual departments related to both the diagnosis and treatment of cancers. Their main objective is to identify and abstract information on cases of cancer that have been diagnosed by all methods. Arrangements have also been made with the hospitals located outside the Girona registration area in order to obtain information from patients whose cancers have been diagnosed and treated outside the Girona area. Accordingly, these sources are visited once a year to review these procedures. All records are interpreted and after coding, updated and processed. The registry is organised as a multi-user online database.

Morphology has been coded according to ICD-O-3 since 1998 and site has been coded according to ICD-O-3 since 2000. Before 2000, site was coded according to ICD-O-1 and morphology according to ICD-O-2 since 1993. The rules used for coding multiple tumours are those proposed by IARC/IACR. Quality control of data is ensured through the *DEPedit* programme.

Confidentiality is ensured by the application of the rules proposed by the European Network of Cancer Registries (ENCR).

The estimated completeness for the period 1998–2002, taking into account the proportion of DCN cases, was around 95.7%.

Interpreting the results

A screening program for breast cancer was started in the area covered by the registry in 1999, and there are opportunistic screening services for cervical cancer in the area. Use of the PSA test in the medical practices has also increased during this period.

Use of the data

The information obtained is used to produce annual incidence reports. Data on cancer incidence serve as a basis for health planning. Our registry has carried out and participated in epidemiological studies. Studies on both survival and care of patients with some specific tumours are also being carried out.

Source of population

The 1998, 1999, 2000 populations are intercensal estimates based on the 1996 and 2001 censuses, where allowance for births, deaths and migration have been made. The 2001 and 2002 populations are postcensal estimates, where the same methodology used in 1998–2000 has been applied, without making any correction based on a later census.

Multiple primary rules used

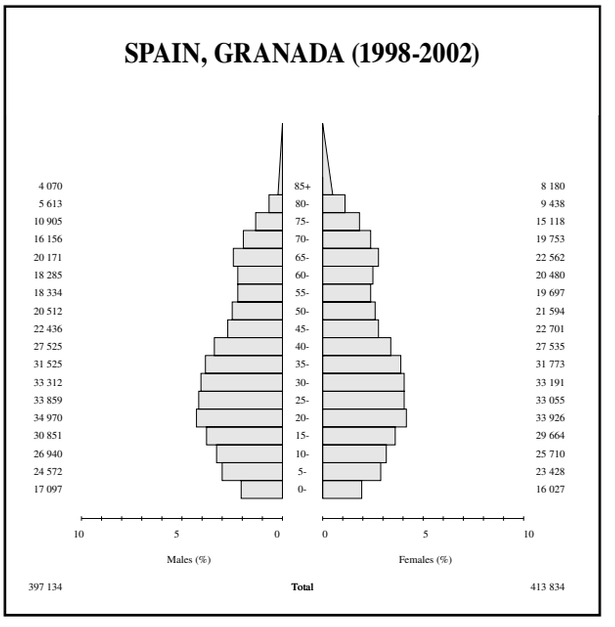
IACR rules (2004) on historical data.

Spain, Granada

Registration area
The population covered is the province of Granada within the Andalusian Region in the south of Spain. It lies between latitudes 38° and 36° N, and has an area of 12 635.3 km^2. The province has 71km of coast along the Mediterranean; a large part of its territory is mountainous, and one of the highest summits of Spain is found there (Mulhacén, 3481 m).

The population in 2000 was 809 006 inhabitants (395 659 men and 413 347 women), 16% of them aged 65 years or more. The province is divided into 168 municipalities: there is only one urban centre (Granada) with approximately 240 000 inhabitants, and 6 other municipalities have more than 20 000 inhabitants, the rest of the population (56%) living in smaller municipalities. The population is ethnically very homogeneous.

Granada has been one of the Spanish provinces with the lowest income per inhabitant, an important factor influencing migratory movements from 1950 to 1970, which have since stabilised. Of the economically active population, 10% are employed in agriculture, 22% in industry and building, and 62% in services. Industrial activity is limited to light industry, particularly food and wood processing. The rate of unemployment is 7% of the active population.



Cancer care facilities
The entire population (100%) has free access to public hospitalisation. The area is served by four public (2137 beds) and three private (356 beds) hospitals. Private hospitals serve a small part of the population. Diagnosis and treatment of cancer are available within the province, so few cancer cases are diagnosed or treated outside.

Registry structure and methods
The Cancer Registry of Granada was established in 1985. It is supported by the Regional Health Department of Andalucía and run by the Andalusian School of Public Health in Granada.

The main registry staff consists of an oncologist as director, one physician, and three clerks for case-finding and data processing. In addition, one epidemiologist, one statistician and one computer expert (part-time) collaborate with the activities of the registry and research projects.

Cancer notification in Granada is voluntary. The basic information sources include all public and private hospitals of the province. The registry receives the automated discharge files for the hospitals and the computerised pathological reports from the public hospitals. Data collection is mixed: incorporation of the automated hospital systems and active complementary search in hospital records by the registry staff. Information based on primary health care is limited. Due to confidentiality requirements, access to death certificates at the National Statistics Institute is not possible, and registry personnel have to collect this information in each of the municipalities. Coverage of this source was about 90% until the year 2000. From this year the access to this source is forbidden.

Data processing is carried out on a personal computer, and quality control of the data is ensured through the IARC-CHECK programme and other specific programmes developed in the registry.

Interpreting the results
Undiagnosed cancer cases are unlikely because diagnosis and treatment (radiotherapy and chemotherapy) of cancer are available in the province of Granada. From the year 2000 it is not possible to use death certificates as a source for case-finding, and this could slightly decrease the degree of completeness, although the percentage of DCO in the previous period was quite low (4%).

An organised population-based breast cancer screening programme has been established gradually in the province of Granada since the year 1997. Opportunistic PSA screening for prostate cancer could be responsible for the increase of prostate cancer incidence rates in the area.

Use of the data
In addition to incidence figures and descriptive studies, some case–control studies on lip, skin and oral cavity cancer have been carried out. The registry is also involved in studies on care and survival of cancer patients within the framework of the EUROCARE study, and in a cohort study on diet and cancer (EPIC Project).

Source of population
Updated using municipal registers of residents as of 1 January. Instituto de Estadística de Andalucía (IEA). Consejería de Economía y Salud.

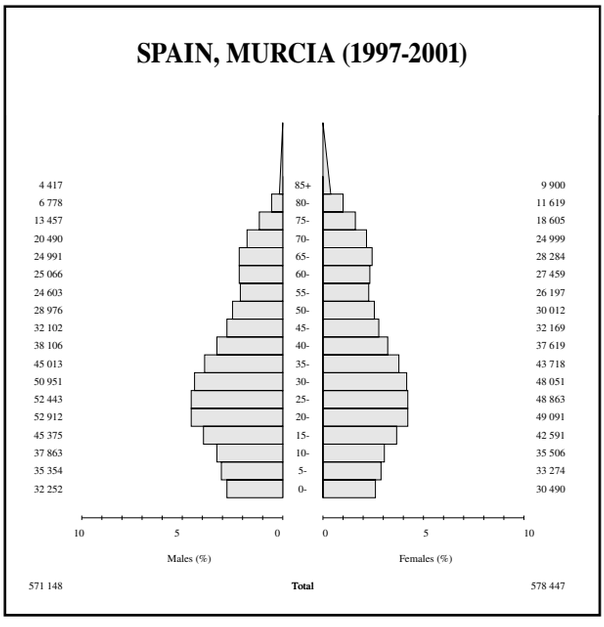
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Spain, Murcia

Registration area

The Murcia Cancer Registry (Registro de Cáncer de Murcia) covers the whole region of Murcia, one of the 17 autonomous communities of Spain. This region is situated in the southeast, a Mediterranean area. The average density is 118.1 inhabitants. The region is divided into 45 municipalities. Approximately 53% of the population lives in three municipalities with more than 50 000 inhabitants, while 7% lives in rural areas (<10 000 inhabitants). The main cities are Murcia, the capital, with 409 818 inhabitants, Cartagena with 203 945 and Lorca 87 153.

The population (2000) was 1 149 328, of whom 17.7% are children. Nearly 11% of the working population is employed in agriculture, although the proportion has been decreasing during the last decades; 62% work in services and 27% in industry and construction. The region has an important food-processing industry. Adequate food consumption frequencies are observed in most of the population for fruit, dairy products, olive oil and protein foods such as poultry, eggs and fish. Consumption of red meat is higher than recommended. Two in three people are overweight. The prevalence of smoking in 2002 was 41% in males and 34% in females, showing an increasing trend for women and a decreasing one for men. During the last decades the city of Cartagena had severe air pollution problems, mostly due to industrial emissions.



Cancer care facilities

Primary health care and hospital treatment are provided free of charge to every member of the population through a National Health Service. The region is divided into 6 health districts, each with at least one public hospital. There are 25 Hospitals, 12 public and 13 private hospitals for a total of 4317 beds, 73% of which belong to public hospitals, although practically all private beds may be used by the public health service by agreement.

Patients suspected to have cancer in the primary and secondary care facilities in the registry area are referred firstly to local public hospitals, and secondarily to the reference hospital located in Murcia, which has a comprehensive cancer Radiotherapy Unit.

Registry structure and methods

The Murcia Cancer Registry (Registro de Cáncer de Murcia, RCM) was established in 1981 as a project of the *Consejería de Sanidad* of the Region of Murcia, developed by the Department of Epidemiology. The database is registered at the Spanish Data Protection Authority as stipulated by law.

Information is principally collected by registry personnel. The identification of new cases is done mainly through the pathology, hematology, oncology, radiotherapy, outpatient clinics and clinical departments of public hospitals. Registry staff abstracts medical records to complete cancer data. In private hospitals the main sources of information are pathology laboratories and medical record departments. In order to ascertain cancer patients who are treated out of the region, the RCM receives notifications from the National Registry for Childhood Cancer (RNTI) as well as from the social security reimbursement service, which refunds expenses for being treated in hospitals out of the Region of Murcia.

In 1996, a new semi-automated program was developed. All previously registered cases were converted from ICD-O-1 to ICD-O-2 with IARCtools and, in addition, a considerable number of cases were manually reviewed.

When cancer is mentioned on a death certificate (DC), and the Registry has no information on that case, the main files of the principal hospitals are searched. If the case is not found, the certifying physician is questioned. If the information gathered is sufficient to register the case, that case is registered as a Death Certificate Notification (DCN). If no other information is available apart from that on the DC, the case is accepted as a Death Certificate Only (DCO). Both DCO and DCN, among other indicators, are used for monitoring quality control.

Interpreting the results

Opportunistic screening for cervical cancer is carried out by public and private healthcare, increasing the number of Pap tests from the eighties to the nineties, but there is a low number of total cervical cytology compared with the rest of Spain. The PSA testing is an irregular practise in the region of Murcia operating by the cancer society and clinicians. A population-based screening programme for breast cancer started at the end of 1995 with a current participation rate near 70% of the total female population in the region.

Use of the data

The main purpose of the Registry is to estimate cancer incidence in the region, trends and survival. In addition, the RCM is used for planning and evaluation of cancer control programmes as well as for epidemiological studies. The RCM has participated in two multicentre case–control studies, one on HPV and cervical cancer carried out in Colombia and Spain, and another on non-melanoma skin cancer in four Mediterranean countries (initially Helios I Project and afterwards Helios II Project). Currently it is involved in the European Prospective Investigation on Nutrition and Cancer (EPIC study), coordinated by IARC.

The registry participates in EUROCARE, following up cases diagnosed between 1990 and 1998 to provide data and contribute to calculating survival throughout Europe. The Registry is also involved in two multicentre Spanish studies, the first in rare tumours and the second in validating the cancer diagnoses in the minimum dataset from hospitals.

Source of population
Annual estimates: Updated using municipal registers of residents as of 1 May of 1996, 1997, 1998, 1999, 2000, 2001. Madrid, INE.

Multiple primary rules used
IACR rules (1990).

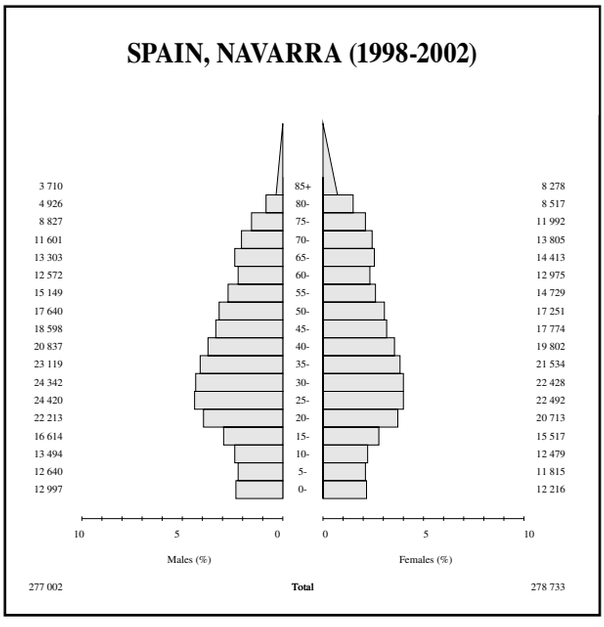
Spain, Navarra

Registration area

The area covered is the Community of Navarra, one of the 17 Autonomous Communities of Spain. Situated in the north of the peninsula, Navarra borders on France to the north (the Pyrenees), the Autonomous Community of Aragón to the east, the Autonomous Community of La Rioja to the south and the Autonomous Community of the Basque Country to the west.

The total area of Navarra is 10 491 km^2. Navarra is scantily populated, with a density of 49.6 inhabitants per km^2, and is the fifth least inhabited Community in Spain.

According to the 2001 census, Navarra had 555 829 inhabitants, of whom 33.5% lived in Pamplona, capital of the province—rising to 50% if the surrounding area is included with the city. Of this population 49.8% are men, 13.7% are aged 0–14, and 18.1% are 65 or over.



In the last decade Navarra has had a small positive migratory balance, as well as a significant re-distribution of the population toward Pamplona and its surrounding area. There are more births than deaths, and the population has grown older over the last years due to the large decrease in mortality. During the last 25 years, the birth rate fell from 17.72 in 1975–76 to 10.04 in 2001. The mortality rate adjusted for the European population in the period 1995–99 was 774.8/100 000 inhabitants for men, and 410.9 for women; in 2000–04 it was 691.6 and 368.1, respectively. During 2000–04, life expectancy for those born in Navarra was 77.9 for men and 85.0 for women.

Cancer care facilities

The Navarra Health Service covers 95% of the population. Health care in Navarra is composed of basic health districts, which are grouped into three health areas. All inhabitants have access to the health system through the primary level (Health and Consultation Centres), or through the emergency departments at the primary or secondary (specialised) level.

Cancer control activities in the region are based on promotion of healthy lifestyle, health checks for people occupationally exposed to carcinogenic substances, and hepatitis B vaccination in childhood. There is breast cancer screening in women aged 45–69, cytology screening for cervical cancer among groups considered to be at risk, and *ad hoc* advice to the population. Any patient suspected of having cancer has access to any diagnostic and treatment facilities considered necessary, and is followed by public assistance services and/or by private services.

Registry structure and methods

The population-based Cancer Registry of Navarra was created in 1970, as a result of the collaboration between the Spanish Association Against Cancer and the Public Health Institute of Navarra. The main objective is to study the incidence and principal characteristics of cancers occurring in Navarra, to promote and facilitate epidemiological investigations, and to provide data for planning of health services and preventive activities.

The registry staff includes one part-time epidemiologist, and a full-time nurse and a social assistant who are responsible for casefinding and coding. An administrator records and processes the data. The Advisory Committee of the Navarra Cancer Registry collaborates with the staff. The data are processed in the Registry itself.

Active casefinding involves systematic collection of information on all cancer cases diagnosed in hospital departments in Navarra. Notification of cancer is voluntary. The principal sources of information are the pathology and haematology laboratories, radiotherapy and oncology departments, as well as the medical records departments of all public and private hospitals. Data on incident cases are completed by data on deaths obtained from the Mortality Registry through a systematic search, mainly for completing the cause and date of death.

Follow-up is carried out through examination of medical records and death certificates. There is no personal contact with patients. Data are recorded on individual notification forms and later entered onto computer with a system of individual access for each registry staff member. Duplicate and quality control checks are run periodically. The IARC rules are used for multiple primaries.

Interpreting the results

During this period, no changes occurred in the area covered, although the number of inhabitants increased by 6.7% between 1996 and 2001. The aging of the population is to be taken into consideration: at the time of the 1996 Census there were 14.3% population under 15 years and 17.4% over 65 years. There have been no changes in the availability of diagnostic services and/or treatment.

In 1993, topography and morphology were coded using CIE-0-2 for Oncology. During 1993–2002, the European Network of Cancer Registries recommendations on incidence date and behavioural classification in bladder cancer were applied. Since 1995, all tumours of the Central Nervous System have been collected.

Since 1990, there has been a breast cancer screening programme for women aged 45-64, raised to age 69 for the years 1998–2002. The increase of prostate cancer incidence rates could be due to increased use of the PSA test during this period.

Use of the data
The registry produces local reports on cancer incidence in Navarra for biennial and quinquennial periods. It has collaborated in evaluation of the breast cancer screening programme in Navarra. The registry has participated in two case–control studies on cancer of the cervix and of the larynx, and in a study on brain cancer. It is collaborating in the EPIC study as well as in studies of trends and of childhood cancer. The registry participates in EUROCARE and the EUROPREVAL group. It has been providing data to Cancer Incidence in Five Continents since Volume III, as well as to the ACCIS and EUROCIM databases of IARC.

IACR rules (2004) on CI5 IX period.

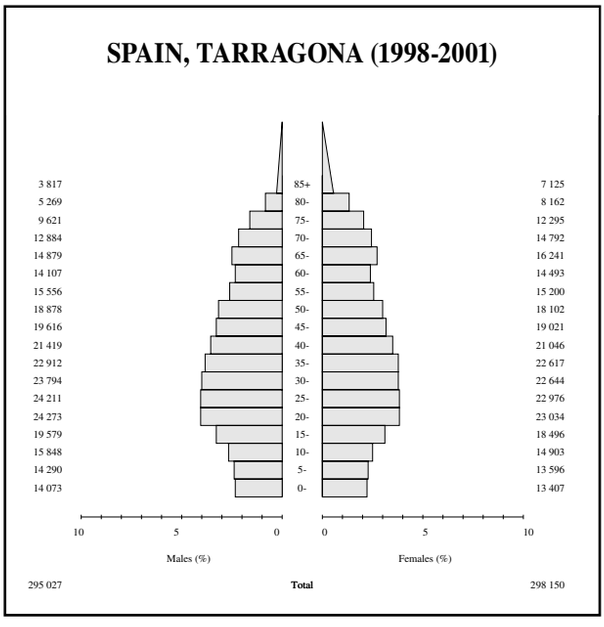
Spain, Tarragona

Registration area

The Tarragona Cancer Registry covers the province of Tarragona, located in the south of Catalonia in the northeast of Spain next to the Mediterranean Sea. In July 2000 the population was 595 652. The two largest towns have 114 000 and 89 000 inhabitants respectively. Five other towns have more than 20 000 inhabitants, 26 other towns have 3000–20 000 inhabitants and 147 villages fewer than 3000.

Approximately a third of the population was born in other parts of Spain and migrated between the 1950s and 1970s. About 20 000 foreigners are officially residents in the province (among them, more than 8000 from Morocco and 7000 from Europe). Since the establishment of the Registry in 1980, there have been no changes in the area covered by it, although the population increased from 513 000 in 1980 to 607 000 in 2001. Most of the people belong to the white Mediterranean race. Roman Catholicism is the major religion.

The prevalence of smoking in people aged 15–64 was 55% in males and 20% in females in 1982, and 43% in males and 25% in females in 1998. Of the working population, 7% belong to the agricultural sector, 21% to the industrial sector, 14% to the building sector and 58% to the service sector. In the province there is a petrochemical complex active since the 1970s. Three nuclear power stations have been running from the 1980s; another has been stripped down after running since 1975.



Cancer care facilities

Practically all the population is covered by the National Health Service. In 2000 the number of physicians was around 2000. In the period 1998–2001 there were seven public hospitals and six private ones in the area, with a total of 1250 beds. One of the public hospitals has a 32-bed oncology department that includes medical oncology, radiotherapy oncology and palliative care units. Some cancer patients are transferred to specific hospitals in Barcelona (100km from Tarragona), which are also sources of information for the Registry.

Registry structure and methods

Since 2001, the Registry has belonged to the Foundation League for the Cancer Research and Prevention, which receives financial support from the Department of Health of the Catalan Government. The Registry also receives funds from the provincial administration.

The staff includes a director, two epidemiologists, a computer scientist, a nurse, a medical officer and one clerk. Several specialists (in oncology, pathology, epidemiology and others) act as external collaborators.

Notification of cancer is voluntary. Data collection is through passive notification in the majority of sources and by active search in the rest. The main sources of information are inpatient records, pathology laboratories, hospital-based cancer registries and haematology laboratories. The Registry receives copies of all death certificates of people who were living in the province. Cases notified from a death certificate are systematically traced, and if no further information is obtained, are registered as death-certificate only cases.

The Registry records malignant tumours whether *in situ* or invasive, and includes tumours of the nervous system of undetermined nature. Bladder papillomas, if histologically verified, are not registered. Although the Registry employs a set of rules for the inclusion of multiple primaries, which are more liberal than those of IARC/IACR, the results presented here strictly follow these rules.

The control of duplicates is based on name, birthdate, sex, places of birth and residence, personal identity number and social security number. Online checks are made when entering the data in the computer to detect errors and inconsistencies. The IARC-Check program is used periodically to detect errors and unlikely situations.

From 1998, the Registry adopted the criteria and the codes of ICD-O-3 for recording morphology.

Interpreting the results

Some assessments indicate that the completeness of the Registry exceeds 96–97%.

Since the beginning of the Registry in 1980, availability of diagnostic and treatment services increased, although it is difficult to estimate the influence of these changes in the cancer incidence trends.

There was no population-based cervical cancer screening programme in the area during the period, but an annual average of approximately 36 000 cytological examinations for cervical cancer were carried out.

A population-based breast cancer screening programme started in 1998 for women aged 50–64, raised to age 66 in the second round. The participation rate in the first round was 58%. About 36% of participants of this programme had a previous mammogram within the two years before the mammogram of the programme.

The use of the PSA test was quite high during this period, but the degree of influence of this diagnostic procedure on the prostate cancer incidence rates in Tarragona is not known.

Use of the data

The Registry produces cancer incidence and survival statistics for the area, and describes their major epidemiological characteristics and their evolution. It also promotes epidemiological research and advises policymakers on current and future needs for cancer care services. It collaborates directly in the evaluation of the Breast Cancer Screening Programme of the province,

supports the evaluation of cervical cancer prevention and other cancer control activities and evaluates its effects.

Source of population

Multiple primary rules used
IACR rules (2004) on historical data.

Spain, Zaragoza

Registration area
The Zaragoza Cancer Registry covers the population of one province (Zaragoza) within the region of Aragón, in the northeast of Spain. The population at the most recent census (2000) was 848 006. About 81% of the population lives in urban areas; most are Christians.

Cancer care facilities
General health care in the region is provided predominantly by the Health Services Department of Aragón through a network of primary health centres and public hospitals. This is supplemented by private practitioners and hospitals. The Zaragoza Cancer Registry is located in Zaragoza, the capital of the province, and provides radiotherapy, cancer surgery and chemotherapy services. Patients suspected to have cancer in the primary and secondary care facilities in the registry area are mostly diagnosed and treated in the public hospitals of Zaragoza. We estimate that very few patients are followed outside the registry area.

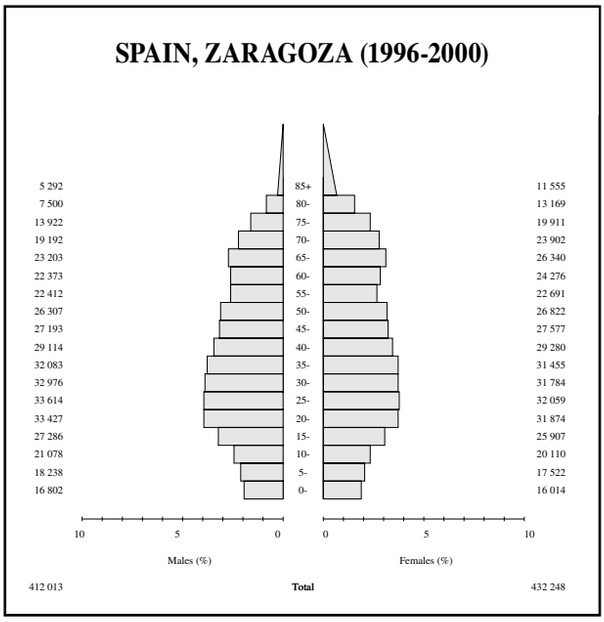
Registry structure and methods
The registry was funded in 1960 by the state Health Department. The registry is staffed by two part-time medical officers, one part-time administrative worker and one full-time health worker.

The Zaragoza Cancer Registry uses several different sources of data: primarily pathology and haematology laboratories, radiotherapy and chemotherapy services and hospital discharge records. The registry staff visits these sources and records all cases with diagnosis and treatment of cancers diagnosed by all methods, among residents of the registry region. We supplement this information with death certificates when cause of death is identified as cancer.

For some cancers, such as haematological tumours and childhood tumours, complementary information sources (such as the Haematological Registry and the paediatric hospital cancer registry) are used to evaluate the completeness and accuracy of the information recorded.

Interpreting the results
It is not possible to estimate how many cancer cases remain undiagnosed, but it probably occurs only for elderly subjects who have had a pathology diagnosis. PSA testing is common in the population.

In interpreting these results, note that since year 2000 data have been received electronically, as a new method of data collection. Automatic registration began in 2000 as well.



Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. Some special studies have been carried out. The Registry is participating in several epidemiological studies such as risk of second primary cancers, rare tumours in Spain, childhood cancer trends, incidence and mortality cancer inequalities, the HAEMACARE project and validity of hospital discharge records for estimating cancer incidence. Policymakers mainly use our cancer registry data for planning purposes.

Source of population
Obtained from municipal census.

Multiple primary rules used
IACR rules (1990).

Sweden

Registration area
The Swedish Cancer Registry covers the whole population of Sweden. The mean population in 2002 was 8 924 958. About 24% of the population lives in urban areas (>100 000 inhabitants). The main part of the population is Protestant; approximately 15% are not members of the Church in Sweden.

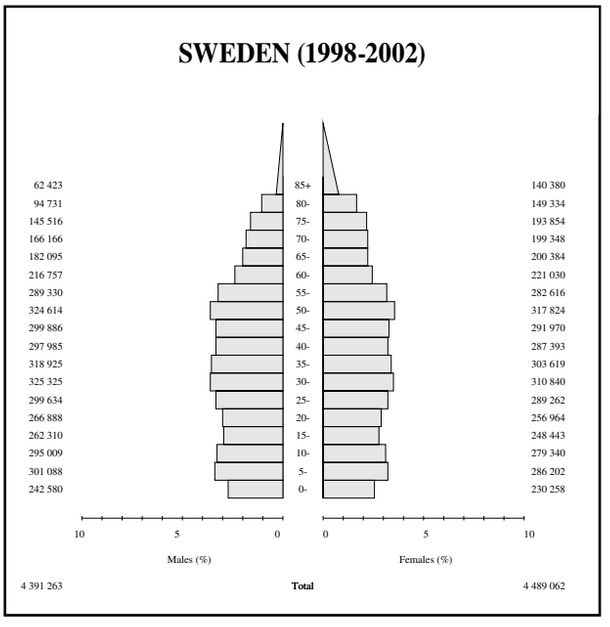
Cancer care facilities
Cancer care facilities in Sweden are incorporated with the general healthcare system. There are oncological centres in each one of the six medical regions of Sweden. Nearly every cancer case will sooner or later be seen at a hospital. Hospital and forensic pathologists make independent compulsory reports on every cancer diagnosis made from surgical biopsies, cytological specimens and autopsies.

Registry structure and methods
The Swedish Cancer Registry, which was established in 1958, is managed by the Centre for Epidemiology (EpC) at the National Board of Health and Welfare. The Government finances the registry. Six regional cancer registries covering the whole country perform the registration of new cancer reports and the major check-up and correction work. These registries are associated with the oncological centres in each medical region of Sweden.

The registration of newly detected tumour cases is based on compulsory reporting by all physicians responsible for in-patient and out-patient departments in all public and private establishments for medical treatment. The data in the Registry are supplemented with information on cause and date of death by computerised linking with the Cause of Death Registry. The Swedish Cancer Registry does not use information on cancers based on death certificates only.

Interpreting the results
The overall reporting to the registry is estimated to be 96% of all diagnosed cases.

There are two main screening programmes in Sweden: breast and cervix cancer. PSA testing for men is also quite common in recent years.



Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes. The publication is, since year 2000, only published on the Internet.

Many researchers in Sweden and in other parts of the world use the registry.

Source of population
Official population statistics from Statistics Sweden.

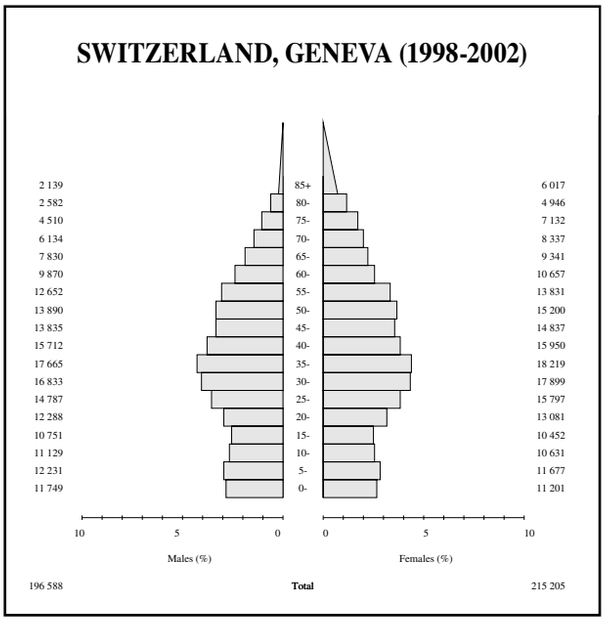
Multiple primary rules used
IACR rules (2004) on historical data.

Switzerland, Geneva

Registration Area

The Canton of Geneva is situated at the extreme west of Switzerland. It has a total surface of 282 km^2, of which Lake Geneva occupies 36 km^2. The climate is temperate: mean temperature is 11.5°C, with temperatures varying from -8.8°C to 35.3°C in 2002. The annual rainfall amounts to 1166mm (2002). Air quality is fairly good: the annual average pollutant concentrations observed in the centre of Geneva are 6 μg/m^3 for SO_2, 32 μg/m^3 for NO, 42 μg/m3 for NO_2, 34 μg/m^3 for O_3 and 0.6 mg/m^3 for CO (2002, from ROPAG-SCPA).

On 31 December 2002, the population of the canton was 427 705, of whom 14.5% were aged 65 and more and only 21.9% younger than 20. This structure is due not only to the joint effects of a low fertility rate and an increase in life expectancy, but also reflects fairly heavy immigration (often temporary) at the ages of economic activity. This immigration comes traditionally from Latin countries. Due to a restrictive policy in granting Swiss nationality, the proportion of the resident population considered as foreign remains high, at 38.4%, of which 18% were Portuguese, 14% were Italian, 12% French and 10% Spanish.



The economically active population is concentrated in the administrative and service sectors (82%), with production workers comprising most of the remaining population (16%); agricultural workers are few (<2%), due to the small amount of cultivated land and the high degree of agricultural mechanisation (1995 figures). These figures remain unchanged to date.

Cancer care facilities

The hospital facilities for acute illnesses comprise one general public university hospital with 1267 beds (1997) and some smaller private hospitals and clinics. Cancer patients are also treated at two other university hospitals, namely a geriatric institution (300 beds) and a hospital for chronic affections (300 beds). No hospital, either public or private, has beds reserved specifically for cancer patients. Between 1997 and 2002 there were no major changes.

Registry structure and methods

The Geneva Cancer Registry was founded in 1969 and started recording cases in 1970. In 1991, the Registry was attached directly to the Public Health Service of the Canton of Geneva. Since 1999, it has been attached to the University of Geneva, which provides most of the budget. Additional funds are obtained from the Federal Ministry of Health, through the Swiss Association of Cancer Registries.

The staff is composed of 12 persons, most of whom are part-time, with 3 doctors and 2 statisticians. The registry is located in an apartment opposite the Geneva University Hospital in the centre of the city.

Diagnostic and treatment services are easily accessible: Biopsies are mainly carried out at the central laboratory or in other specialised services of the public hospital. Since two years ago, a large part of the biopsies have been transmitted in electronic form, allowing a linkage with the registry's database each month. There are three private pathology laboratories that provide records to the registry or permit systematic consultation of them. Autopsies are performed at the university hospitals, and the necropsy rate is estimated at 7% of deceased residents (2002). Every case has a personal number for confidentiality.

Data collection for the registry is undertaken by examining the university hospitals records of the various services concerned, as well as by a questionnaire sent out to private practitioners. The response rate of the latter is more than 90%.

We have access to all reports from the only department of radiation oncology in the canton. This department provides us with a control listing each year. The registry also has access to all death certificates in the canton, which in addition to clinical records, permit a continuous follow-up. In addition to this passive follow-up, the registry also undertakes active follow-up of all cases each year. This follow-up is facilitated by direct access to the Cantonal Office of Population. In the case of death, the primary cause is recorded and re-examined, as well as the possible presence of a tumour, clinical or confirmed, at the time of death.

Interpreting the results

As an indicator of reliability of the data, a very low percentage of cases (<1% 1998–2002) are recorded from death certificates only. In addition, the low rate of cases found at autopsy (0.7% 1998–2002) compared with the total number of cases confirmed histologically suggests that most cases are identified during the lifetime of the patient.

During this period 1998–2002, there was not yet a screening program in the canton for any localisation of cancer, but since 1 January 1999 there has been a screening programme for breast cancer. Nonetheless, spontaneous screening is well accepted in the population, with mean annual screening rates of about 40% for Pap tests (women aged ≥15) and about 20% for mammographic screening (1991–1995). PSA testing is generalised in the population of the canton.

Use of the data

Policymakers do not use our cancer data to evaluate health services. For planning, the cancer registry has received an

official mandate to evaluate the breast cancer screening program and the campaign against melanoma.

In addition to the processing and publication of routine, incidence and survival data, the registry initiates or participates in analytical epidemiological investigations. Several case–control and cohort studies have been undertaken for etiological or evaluative purposes.

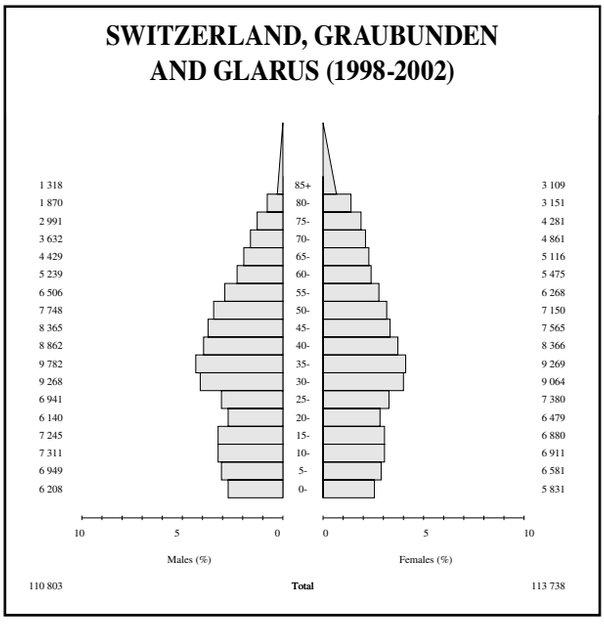
Multiple primary rules used
IACR rules (2004) on historical data.

Switzerland, Graubünden and Glarus

Registration area
The cancer registry of Graubünden Glarus covers the population of the two corresponding cantons in the eastern part of Switzerland. The Canton of Glarus has 29 communities and Graubünden 213. The population at the official census 2000 was 36 600 for Glarus and 187 058 for Graubünden. About 15% of the population of Glarus live in the capital of Glarus, while 20% of the population of Graubünden live in the capital Chur. In both cantons about 40% are Catholics and 50% Protestants. Glarus has about 25% foreigners, while in Graubünden there are about 15%. Most are Christians, whereas only a very small minority are Muslims. Only very few people immigrated from African or South American countries. Among the population of Graubünden, 27 038 were räto-roman, who keep their native language, the *Rumantsch*.



Cancer care facilities
General healthcare in Glarus is provided by the district hospital in the capital Glarus and a network of about 40 practitioners. In the main hospital, cancer surgery and chemotherapy are available.

In Graubünden cancer care is provided mostly in the main hospital in Chur, which includes all cancer services. Radiotherapy is available only at the centre in Chur; some of the patients are treated in Zurich or St. Gall. A network of some 10 hospitals and about 300 practitioners supplement this care. Altogether 5% of the patients are treated in the cantons of St. Gall, Zurich, Ticino or even at hospitals over the Italian frontier (patients from the Posciavo).

Registry structure and methods
The registry is located within the Department of Pathology at the main hospital at Chur, and is funded partly by the cantons of Graubünden and Glarus, and by the Federal Government of Switzerland. A part-time pathologist (less than 10%) and a part-time registrar (80%) are responsible for the registration of new cases. The method of registration is strongly related to guidelines of the cancer registry network of Switzerland.

About 85% of new cases are directly notified through the pathology network, the reminder being found by case study (scrutinising medical documents) in about 30 departments of 12 hospitals of the two cantons. Notification is based on a voluntary agreement between the medical institutions and the registry. Death certificates are provided by the Federal Office of Statistics by special contract. In fact, there are more and more pre-coded data available, facilitating the registry work. Cancer registries of Zurich, St. Gall and the Ticino complete the datasets with information about patients hospitalised outside the registration area. The network of the registries in Switzerland and the central office help to complete the data files in the registry of Graubünden and Glarus, which in fact needs more personnel. As an active member of the Swiss Association of Cancer Registries, the registry has permission from the Central Data Commission for Data Protection in Medical Research of the Swiss Government to receive non-anonymised data on cancer patients.

Periodically quality control and plausibility procedures are performed partly by the registry itself, partly by the Swiss Association of Cancer Registries.

During the reported period there have not been any changes in the covered area or the population registered. Case definition and coding have been kept stable, except for adaptation to TNM-Classification or the recommendations of the AJCC. Reporting includes incidence and follow-up for periods of 5 and 10 years.

Interpreting the results
Because neither of the two cantons has university service and because a large population live in rural areas, some cancers might go unrecognised. However, the cooperation of the neighbouring cantons ensures that cancers treated outside the registration area are captured.

Still, screening for some cancers (e.g. cervix) is not thoroughly established, and needs further distribution among the rural population at the cantons' periphery. For other cancers, i.e. breast cancer, a screening program is widely accepted. PSA screening for cancer of the prostate is widely accepted and performed. Discussion is ongoing on the possibility of lung cancer associated with exposure to free radicals (i.e. radon) and also to dust-mediated pneumopathies.

Use of the data
The main objective of the registry is to make the data on cancer incidence available to the Swiss Association of Cancer Registries for publication and dissemination. In the future, more active participation in analytical epidemiological investigations is planned. Providing data to policymakers for planning and evaluation of health services has to be established in the future.

Source of population
Annual estimate of permanently resident population at mid–year, based on the 2000 census and taking into account births, deaths and migration. Source: Federal Office of Statistics, Switzerland.

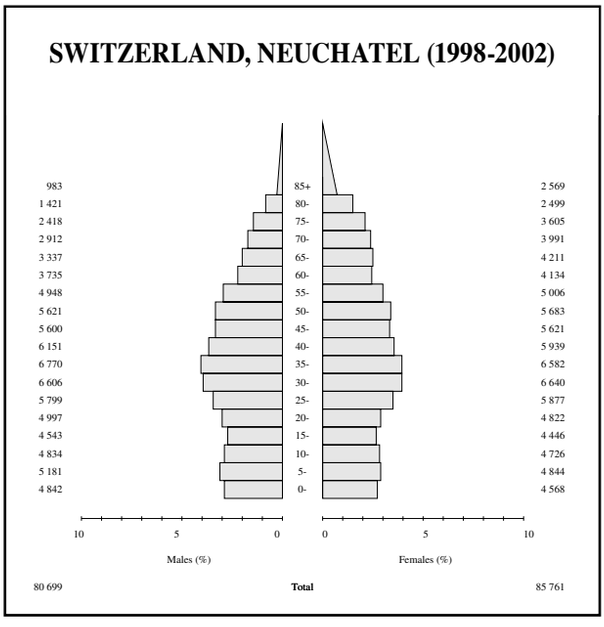
Multiple primary rules used
IACR rules (2000).

Switzerland, Neuchâtel

Registration area
The Registry, which covers the whole of the French-speaking canton of Neuchâtel (800 km^2 with about 168 000 inhabitants), is located in the western part of Switzerland, sharing half of its frontier with France. The canton is a mainly rural region with only two cities of approximately 35 000 inhabitants. In the absence of heavy industry, watchmaking and the micro-technical industry are the main activities.

Almost all the population is of Caucasian origin; 38% are Protestant, 31% are Catholic, and foreigners, predominantly of Mediterranean origin, currently account for about 23% of residents. In 2000, the main occupational sectors in the canton of Neuchâtel were: industry 34%, agriculture 4% and services 62%.

Cancer care facilities
In 2000, the region covered by the Registry had around 900 hospital beds available for diagnosis and treatment (i.e. about five beds per 1000 population). In the same year there were about 520 practicing physicians (one per 320 population). Radiotherapy and oncology services are integrated in a unique coordinated multi-site public organisation covering the whole area.



Registry structure and methods
The bulk of information is provided by the local Institute of Pathology (INAP) through biopsy, cytology and autopsy reports. Notification is based on voluntary agreement between the recording medical institutions of the canton and the Registry. Other sources of information are the departments of oncology and haematology, which also centralise diagnostic and therapeutic procedures for malignant haematological disorders.

The Registry is financially supported by the local League against Cancer (60% of the budget) and by the cantonal public health department for the remainder. Marginal support is also provided by the Swiss government through the Swiss Association of Cancer Registries.

Moreover, information on residents diagnosed or treated outside hospital, elsewhere in Switzerland, or in other countries, is provided by the neighbouring cantonal tumour registries of Vaud and Geneva (mostly upper aero-digestive tract, skin and childhood cancer cases) and the general practitioners.

Further information is also abstracted and systematically checked by the registry staff from hospital charts. A specificity and strength of the registry is the routine integration of an abstract of the medical record in the registry datafile and periodic computer linkage between the latter and the centralised cantonal administrative population database (active follow-up).

All death certificates are checked annually against the Registry files. This constitutes a process of passive follow-up, each subsequent item of information being used to complete the record of an already-registered case.

All relevant information is manually scrutinised before being interactively introduced into the computer of the Computer Center of Neuchatel. Additional, more sophisticated automated verifications and analyses are also performed on stored data in batch mode using *ad hoc* programs by the Vaud Cancer Registry on the computer of the University of Lausanne (UNIL).

Interpreting the results
There has been no organised screening during the incidence period for CI5-IX, but prescription of the PSA test is increasing, although not as dramatically as in most western European countries (preventive prostate examination—via biological test or clinical examination—reported on average by 15% of men aged 40–69 and resident in French-speaking Swiss cantons).

Use of the data
The registry provides routine statistical annual incidence and mortality data by sex, age and primary site, and data for local planning purposes. It is also engaged in (mostly) descriptive epidemiological studies in collaboration with the Vaud Cancer Registry and the six other Swiss population-based registries belonging to the Swiss Institute for Applied Cancer Research (SIAK).

Among the research opportunities offered by the operating structure within the collaboration agreement with the Registry of the Canton of Vaud is the definition of risk of second neoplasms for patients registered with a defined primary.

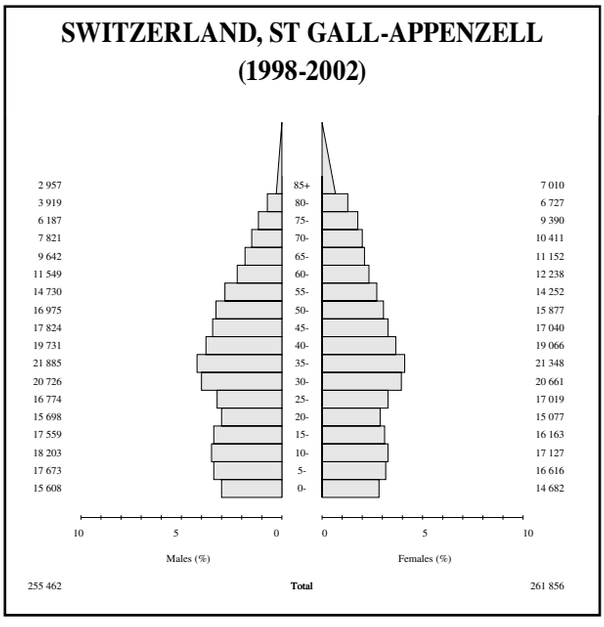
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Switzerland, St Gall-Appenzell

Registration area
The registry covers the three cantons of St Gall, Appenzell AR and Appenzell IR in the northeastern part of Switzerland, a total area of 2430km^2. It extends between latitudes 46° and 47° N; the lowest point is 396m and the highest 3247m above sea level.

The registry covers the entire resident population, amounting to 521 971 in mid-2002. Of this total, 87% belong to the canton of St Gall. Major parts of the area are rural. There is one city with 73 000 inhabitants. Important industries are metal machines and vehicles, and construction, which are relatively broadly distributed over much of the region. In 2000 the per capita income was 86% of the Swiss average in St Gall, 81% in Appenzell AR and 87% in Appenzell IR. Five sixths of the population are Swiss, the others mainly of other European origin.



Cancer care facilities
In 2002 there were 882 active physicians (1 per 592 inhabitants). About 1720 hospital beds were available in acute hospitals. The central hospital in the city of St Gall has a special clinic for oncology as well as for radio-oncology, and a public outpatient clinic for cancer patients that takes care of patients referred by general practitioners and other clinics. In addition, there are ten consultant oncologists. For inpatient care patients are usually referred to a hospital within their region. Most cancer patients are treated at the central hospital or in one of the peripheral acute hospitals within the region at least once during their disease. Some people in areas adjacent to the urbanised canton of Zurich seek care there.

Registry structure and methods
The cancer registry was founded by the Regional Cancer League in 1960 at the department of pathology in the central hospital of St Gall. It was hospital-based until 1980, when it became population-based. The sponsoring bodies are the Regional Cancer League and the three cantons covered by the registry, and it is also subsidised by the Federal Government. At present the registry has 3.6 full-time positions.

Reporting of cancer cases is voluntary. The most important data source is active and passive collection of reports from the central pathology laboratory. In addition, the registry staff actively collects data in the other pathology laboratories in the region and in all regional acute hospitals. In the central hospital, the departments of oncology, haematology, radiotherapy, neurosurgery, paediatrics and the geriatric clinic are actively scrutinised. There is a routine exchange of information with the other cancer registries of Switzerland, especially with those covering two neighbouring cantons (Zurich and Grisons). Active case ascertainment has also been organised with consultant oncologists in the region. Finally, all death certificates with a cancer diagnosis are scrutinised, and further information is sought out. Active follow-up for survival is carried out systematically at 5 and 10 years after diagnosis.

Reports are usually checked within a few days after receipt. Names and dates of birth are checked in order to find duplicates. In case of doubt, a physician is asked for advice. Six months after receipt of the first report, additional information is sought if necessary by mailed questionnaire or in the case notes of hospitals. Addresses are checked with official population control offices. Cases are finally coded and closed by a physician only about two years after onset.

Several logical checks are automatically made by the computer system. The coding is visually checked on the screen and, after completion of a case, on the case printout. Additional systematic checks on duplicate registrations are done after completion of a registration year. Checks on consistency of site, morphology and age are done through the Association of Swiss Cancer Registries.

Completeness of registration has been traditionally evaluated by the incidence/mortality method (death certificate method) and more recently via the so-called "flow method" (Boullard et al.). By this method it was ascertained that over 90% of the incident cases are registered within 12 months.

Interpreting the results
There are no population-based cancer screening programmes in this region. Screening is performed as an individual initiative and seems to be popular and effective for cervical cancer. More than 85% of cervical cancers registered were *in situ* carcinomas. Early detection of breast cancer, on the other hand, could be much improved. Only 7% of breast cancers registered in women aged 50–69 years during 2000–2004 were non-invasive.

Use of the data
The registry prepares yearly routine reports on cancer incidence including five-year periods. Analyses such as time trends of cancer incidence and mortality, survival and stage distribution in selected cancer sites are also carried out. *Ad hoc* analyses are done on request.

The registry's data have been included in joint studies of the Association of Swiss Cancer Registries, e.g. on time trends of incidence of lung cancer, incidence of cancer in childhood, and the risk of cancer by occupation. The registry takes part in international studies (ACCIS, EUROCARE, CONCORD, EUROPREVAL, EUROCHIP) as well.

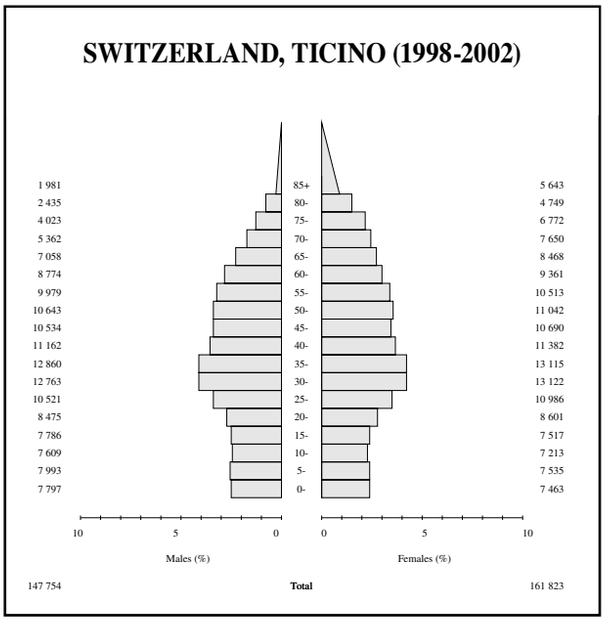
Multiple primary rules used
IACR rules (2004) on historical data.

Switzerland, Ticino

Registration area

The Canton of Ticino is situated at the extreme south of Switzerland. It has a total area of 2812 km^2 and is bordered on the north by the Canton of Uri, on the east by the Canton of Graubünden and Italy, and on the south and west by Italy. The highest point is 3402m and the lowest 194m above see level. The climate is temperate, with average temperatures varying from 4.0 in January to 21.8 in August, and the annual rainfall amounts to 1564mm (1997). Air quality has been measured in Ticino from 1990: the annual average pollutant concentrations observed are 13 μg/m3 for SO_2, 44 μg/m3 for NO_2 and 218 μg/m3 for O_3 (City of Lugano, 1996).

The population of the canton at 31 December 2000 was 309 357. The structure also reflects immigration in the age of economic activity: 73% of the population have Swiss nationality and 27% is foreign, mainly from Italy and the former Yugoslavia. The majority of the population is Christian, with 84% Roman Catholics. The official language is Italian. Employment distribution is: 1.7% in agriculture and forestry, 24.8% in industry and 71.8% in the service sector (census 2000).



Cancer care facilities

In 2000, there were five public regional hospitals and four zone hospitals, for a total of 1042 beds and 695 hospital and private practitioners in the canton. There are no population-based screening programmes in Canton Ticino. Spontaneous screening is well accepted in the population, for either breast or cervical cancer. There is one radiotherapy department for the entire region covered by the Cancer Registry. Opportunistic PSA testing is common in the population.

Registry structure and methods

The Cancer Registry of Canton Ticino was founded in 1995 by the local government. Collection of population-based data began in 1996. The Cantone Ticino provides most of the budget and additional funds are obtained from the Federal Ministry of Health, through the Swiss Association of Cancer Registries.

The Registry was founded on a cantonal law, based on a popular initiative. It is located at the Cantonal Institut of Pathology. One medical doctor and a data manager are responsible for active data collection and coding. A statistician is responsible for quality control and data elaboration. Reporting of cancer cases is done on a voluntary basis. A web page is updated regularly (www.ti.ch/cancer). About 80% of cases are notified by the Cantonal Institute of Pathology and Cytology. Additional cases come from main hospitals, radiotherapy and oncology centres, haematology laboratory, oncologists, general practitioners and from cancer registries of Geneva, Vaud, Basel, Zürich and St Gallen (mostly skin cancer). Autopsy is performed on 3% of all deaths. Finally, death certificates with cancer diagnosis are scrutinised and additional information is found by mailing a questionnaire to the physician or by examining case notes in hospitals. Online control of inhabitants of the canton is performed at the Cantonal Office of Population Registry.

The Registry collects all malignant invasive and *in situ* tumours. The registration of basal-cell carcinoma is incomplete for the years 1996–2003. The following data are coded: personal identification number, tumour occurring before the registry was started personal data, date of first symptoms, date of morphology confirmation, topography, morphology, stage, diameter in mm and axillary node for breast cancer, basis of diagnosis, method of diagnosis, first treatment and date of death.

All information are manually checked and coded (according to ICD-O-2) by the registry staff before entry in the computer. The computers themselves do preliminary plausibility tests at data entry, and a second check is performed by the staff daily. Several plausibility checks, like logical sequence of dates, validity of codes, morphology by topography, by sex and age (over 200 crosschecks) are performed monthly in addition to the IARC Check programme.

Active follow-up of all patients with tumours is performed yearly. We have published a study of completeness: http://www.ti.ch/DSS/DSP/IstCP/RCT/pdf_ppt/Relazioni_e_Poster/2005/GRELL05_completeness.pdf.

Use of the data

The Registry is currently involved in epidemiological research such as biomolecular epidemiology, survival analysis (EUROCARE), and others: http://www.ti.ch/DSS/DSP/IstCP/RCT/temi/studies.htm .

Policymakers use our Cancer Registry data for planning and evaluation of health services. Please see the website for further information: www.ti.ch/tumori.

Source of population

Average mid–year annual estimates, based on official numbers of births, deaths, immigrations and emigrations, on December 31st. Office cantonal de statistique.

Multiple primary rules used

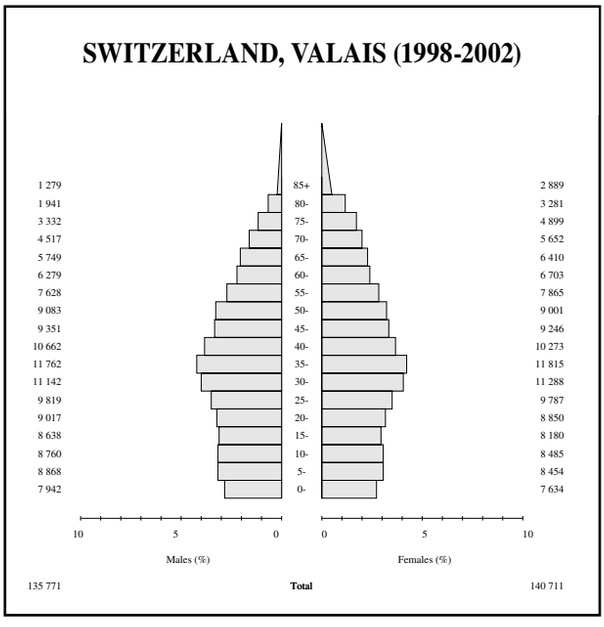
IACR rules (2004) on CI5 IX period.

Switzerland, Valais

Registration area

The canton of Valais covers an area of 5225 km^2, with a population of 281 500 at the end of 2002. The population is 35% urban, the majority living in a rural area or in the mountainous region of the Alpine range. The Valais Alps, a non-productive area, account for 54% of the land surface. The climate is relatively drier and sunnier than in the rest of northern Switzerland. The German-speaking 'High' Valais, 28% of the canton, is distinguished from French-speaking Central Valais and 'Low' Valais not only by language, but also by culture.

The population is largely of Caucasian origin; the majority are Roman Catholics (81%). The population is 17.6% of foreign origin, principally Italian Portuguese and people from the former Yugoslavia. The structure is that of an ageing population, with 15.6% of people older than 65 years. One of the features of this population is its great stability, the genetic structure being more homogeneous than is general in the country—a fact demonstrated by the studies on genetic predisposition to colorectal cancer.



The economically active population works 58.5% in the services and tourism sector, 22.5% in industry (construction, chemical, metallurgical, wood) and 3.5% in agriculture. Valais is an important producer of wine (40% of the national total), fruit and vegetables. From the viewpoint of potential occupational risk factors, there are three industrial centres, each with more than 1000 employees, producing plastics, colorants, agrochemical products, aluminium (exposure to fluorine and asbestos), solvents and products derived from cyanide.

Cancer care facilities

There are 19 physicians per 10 000 inhabitants. The health system centres around six public hospitals, a specialist respiratory centre and one private clinic, a total of 840 beds for acute care, excluding several geriatric, psychiatric and chronic care institutions. The Department of Oncology of Valais is a network of cancer care facilities which gather specialists consulting in the public hospitals and in private, or working in a centralised radiotherapy service in Sion. A few cases requiring additional facilities are treated in university centres such as Lausanne, Geneva, Berne, Zurich or Basel.

Registry structure and methods

Since 2002, the registry has been attached administratively to a newly created 'Health Observatory' of Valais, supervised by the Public Health Service of the canton and situated in the capital Sion. The registry is located there and shares the computer network of the Central Institute of Valais Hospitals (CIVH). The registry is largely financed by the Canton of Valais; the Swiss Confederation contributes 10–15% of the budget.

The staff consists of a physician responsible for registration (80% of one post), an assistant physician (40% of one post) and two secretaries (one post full-time, one half-time).

The principal source is the pathology department of the CIVH, whose histological or cytological reports concerning cancer are available to the registry via specific software. This source represents about 75% of the cases registered. Other sources comprise registries situated in the university centres of other cantons, the medical records of the hospitals (notifications are made on the basis of computerised lists of hospitalisation with diagnoses coded to the ICD), oncological specialists who send a copy of their consultation reports, and a computerised listing of deaths.

Notification is essentially passive, but a questionnaire is sent to the treating physician for the majority of registered cases, and demographic data are verified through the municipalities, again by questionnaire.

Access to death certificates is authorised for DCN cases through a contract with the Federal Office of Statistics, Neuchâtel, thus guaranteeing confidentiality.

Notification of cancer is voluntary. Physicians are authorised to transmit data if their patient has not specifically refused such communication, which had never happened by the end of 2002. In 1995 an expert commission on professional secrecy and medical research authorised regulations for medical confidentiality throughout the process of data collection, storage and processing of data.

The data are validated by different programs, including IARC Check. Quality control of data notified electronically is carried out by the suppliers.

Interpreting the results

Most demographic factors have remained stable. The increasing percentage of foreigners since 2000 is due partly to a renewal of immigration and a more constant birth rate in the native population.

Use of the data

The incidence data are used to inform the public health planners and the medical profession about cancer in the population. The results of the most recent reports have confirmed discrepancies between the incidence of some tumours in two different regions, i.e. 'High' Valais and 'Low' Valais. In particular, lung cancer is more frequent in the western ('lower') part than in the eastern, German-

speaking ('higher') part of canton Valais. The intensification of cancer screening (an official breast cancer screening programme for women aged 50–70 started in autumn 1999) has contributed to an increase in the incidence of breast cancer mainly and prostate cancer secondarily. The registry also participates in survival studies at the national (Association of Swiss Cancer Registries) and international levels (CONCORD study).

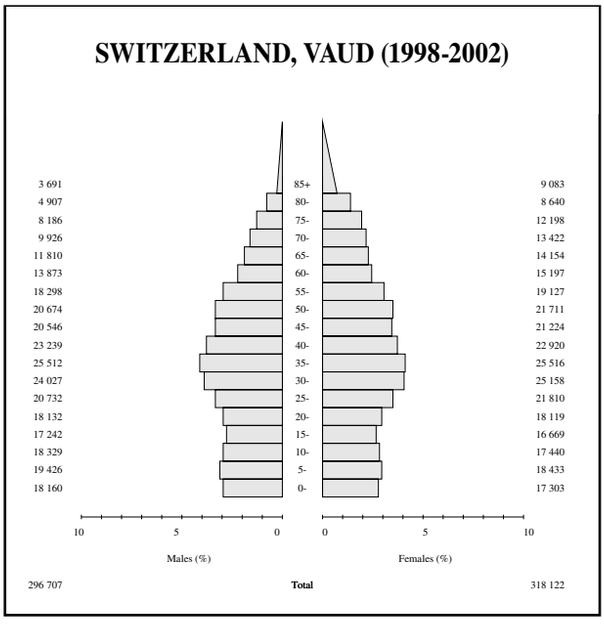
Multiple primary rules used
IACR rules (2004) on historical data.

Switzerland, Vaud

Registration area

The registry covers the French-speaking Canton of Vaud, the fourth-largest of the 26 cantons in the Swiss Confederation (surface area 3212 km^2) and third in number of inhabitants (about 640 000 in 2000).

The 385 communes that compose the canton are grouped into 19 administrative and political districts. The density of population (193/km^2) slightly exceeds the mean for the whole country. In 2000, foreigners, predominantly of Mediterranean origin, accounted for about 25% of residents. Since the early 1970s the number of resident workers has remained stable. In 2000, the main occupations were industry (19%), agriculture and fishing (5%) and services (76%). In December 2000, only 23% of the Vaud population were 0–19 years old, while 15% were aged 65 years and older. Although Lausanne, the capital and its suburbs represent only 4% (115 km^2) of the canton's area, about 45% of the total population reside there.



Cancer care facilities

In 2000, about 3000 public and private hospital beds (about five hospital beds per 1000 population) were available for diagnosis and treatment. In the same year there were about 2800 hospital medical doctors and private practitioners (one per 230 population). The health care system is insurance-based, but practically the whole of the population enjoys access to medical care. A major public university multi-disciplinary oncology and radiotherapy (1142 treatments in 2003) centre is available to the whole population, as well as a few peripheral—mostly hospital-based—medical and surgical oncological facilities. Two additional radiotherapy private units are in operation (overall, 948 treatments in 2003).

Registry structure and methods

The Registre Vaudois des Tumeurs (RVT) began in January 1972, and population-based data have been available since 1974. The registry is a constituent part of the Cancer Epidemiology Unit at the Social and Preventive Medicine Institute (IUMSP), University of Lausanne. The majority of the financial support comes from the Public Health Department of the Canton of Vaud. Additional *ad hoc* funds are supplied by the Swiss Federal Government and the Swiss League against Cancer, which support several studies in the fields of descriptive and analytical epidemiology.

In addition to the director, the staff comprises one part-time medical associate, one part-time computer programmer, and 3.5 clerks. The director is also in charge of the administrative and scientific supervision of the cantonal Registry of Neuchatel.

Notification is based on a voluntary agreement between the recording medical institutions of the canton and the registry. The main sources are the cantonal University Pathology Department of Lausanne and three other major private pathology laboratories, which perform the majority of the histological examinations for the population. Most cases are registered repeatedly and from different institutions. Cancer cases are listed alphabetically and according to a chronological registration numerical index.

All relevant information is checked manually by the registry staff and subsequently coded before being entered into the computer of the University Hospital of Lausanne (CHUV). A first series of automatic checks on data is run whenever new information or modifications are added. Data are transferred to the computer of the University of Lausanne (UNIL), where more specialised checks and analyses are performed. Passive and active follow-up information is recorded. Identification data on all deaths in the Canton of Vaud as well as on cancer deaths are available.

Interpreting the results

A mammography screening programme for breast cancer was activated in 1999 targeting all resident (about 70 000) women aged 50–69 (participation rate around 50% in 2003). Spontaneous screening for cervical cancer is common (over two thirds of women aged 20 or older report at least one examination). According to the most recent National Health Survey, on average 15% of men aged 40–69 and residing in the French-speaking cantons (Suisse Romande) reported a biological test or clinical examination of the prostate within the year preceding the survey.

Use of the data

Annual incidence data by sex, age, site and morphology are routinely provided. The registry is also engaged in both descriptive and analytical research in the field of epidemiology. Features of the registry include good registration of non-melanoma skin, since traditionally the large majority of cutaneous lesions are surgically resected and examined by a pathologist, linkage of selected pre-neoplastic conditions to the cancer registry datafile in order to study subsequent cancer risk, risk of second neoplasms for patients registered with a defined primary, and systematic analyses of trends in survival. The registry cooperates with clinicians, and is used for population-based case–control studies on ENT, colorectal, breast, endometrial and thyroid cancers. It also serves to evaluate the three breast cancer screening programmes run in the Cantons of Vaud, Wallis and Jura.

Source of population

Average mid–year annual 1998–2002. Estimate: Cantonal Office of Statistics (SCRIS) for each calendar year and five–year age group, based on official numbers of births, deaths, immigrations and emigrations, on December 31st.

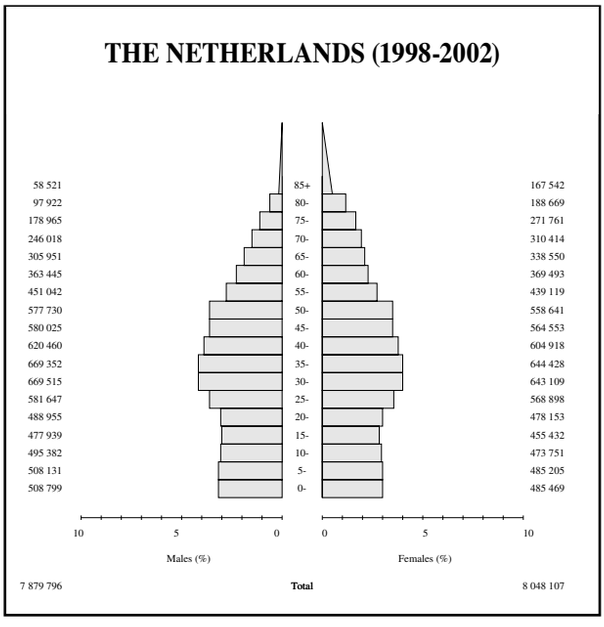
Multiple primary rules used

IACR rules (2004) on CI5 IX period.

The Netherlands

Registration area
The Netherlands Cancer Registry (NCR) comprises nine regional cancer registries and covers the whole population of the Netherlands. The population in 2007 was 16.3 million.

Comprehensive Cancer Centres
General health care in the Netherlands is provided by general practitioners and specialists in academic (7), oncological (2) and general hospitals (5–20 hospitals per region). At least one radiotherapy institution is situated in every region. The nine Comprehensive Cancer Centres (CCC), which are partnerships between healthcare professionals and cancer and palliative care institutions, together form the Association of Comprehensive Cancer Centres). The purpose is to provide access to comprehensive and high-quality care as close to home as possible. The CCCs support networks of specialists and tumour-specific working groups with the development, implementation and evaluation of national and regional guidelines. Consultants are supported for several specialties. Patients in need of specialist care can be referred out of their CCC region. More than 300 employees work in these CCCs, and about 400 consultants are actively involved. CCC,s are independent, private institutions and all hospitals, radiological centres and pathology labs are affiliated with one of the nine centres.



The CCCs receive a fixed annual sum for staffing, materials and location costs, and a variable amount to cover the costs of consultants funded according to the policy regulations of the National Health Tariffs Authority on the basis of the National Health Tariffs Act. In addition, grants are obtained from various bodies including the Dutch Cancer Society (used for activities such as the support of clinical trials), the Ministry of Health, Welfare and Sport (for developing guidelines) and from other organisations (for projects).

Registry structure and methods
The nine regional Cancer Registries, located within the CCCs, pool their data once a year in the NCR. Cancer registration is funded according to the policy regulations of the National Health Tariffs Authority on the basis of the National Health Tariffs Act.

The main source of data is the pathological automated archive (PALGA). Notification also comes from radiotherapy centres and haematology labs, and once a year the cancer registry is linked with the Hospital Discharge Register, which accounts for about 8% of the registered cases. Death certificates are not available because of privacy regulations. Specially trained registration clerks register direct from the medical records in the hospitals.

Interpreting the results
The Netherlands Cancer Registry has been population-based since 1989 and is more than 95% complete. Patients with "cancer" only on their death certificate will be missed, as will cases that have no pathology, cytology or hospital intake.

Use of the data
The registry prepares an annual report of cancer incidence, highlighting trends and changes on both national and regional level. Data are linked with the breast cancer screening programme for evaluation purposes. Several projects (e.g. guideline evaluation and evaluation of the National Cancer Control Plan) with hospitals and universities are supported by cancer registry data. More than 25 data requests are answered every year, both at the national and regional levels.

Source of population
Statistics Netherlands.

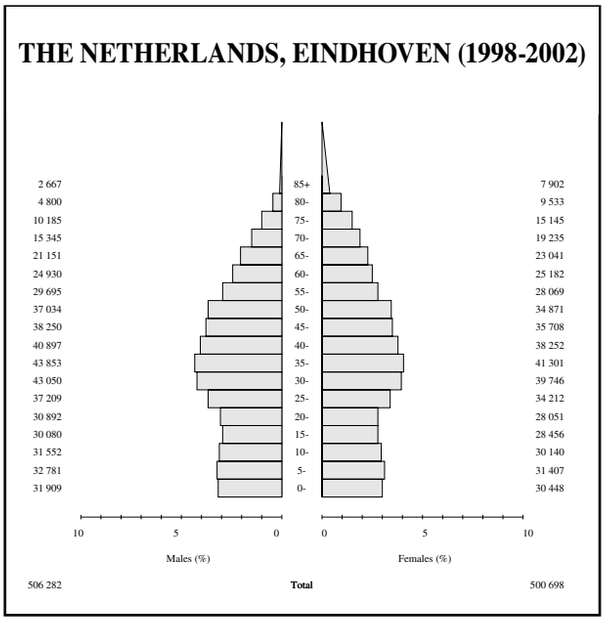
Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Notes on the data
C67 does not include non–invasive tumours.

The Netherlands, Eindhoven

Registration Area

Since 1972 the registry has served an area of about 2500 km^2, lying 20–50m above sea level and including almost one million inhabitants (6% of the 1990 Dutch population). Since 1988 another million have been added bringing the total 2000 population to 2.3m and being part of the national registry. This dataset only includes incidence and mortality data from the original population that grew from almost 300 000 since 1958. The population density was about 400 per km^2, roughly the national average; 47% of the population-at-risk live in urban, 43% in suburban and 10% in rural municipalities. The traditionally Catholic population has secularised rapidly since the mid-1960s, with concurrent large-scale introduction of oral contraceptives leading to a lower fertility rate (from 3 to 1.5) and higher age at first birth (from 22 to 29 years). The proportion of immigrants has been rapidly rising since the 1970s, to >10% at younger and middle age.



With regard to the environment, an intensive pig and poultry breeding industry has developed since the 1970s, contributing considerably to acid rain and rising nitrate levels in groundwater, decreasing again since the 90s. The main industries produce electronic goods, trucks, photocopiers, textiles and milk products, but increasingly replaced by employment in services and transport. The declining tobacco-processing and cigar industry, important in the south-of-Eindhoven area until the 1980s, had a marked effect on the incidence of lung cancer among males, whose prevalence of smoking was 95% in the 1950s. By contrast, smoking prevalence and incidence of smoking-related cancers among females have only risen rapidly since the mid-60s. Among those born after 1965 incidence appears to have begun decreasing again.

Cancer care facilities

In 2004 we began a national obligatory insurance system. Some 98% of the inhabitants are covered by Sickness Benefit Funds, a compulsory social insurance policy for people with low income; less than 1% of the population may be uninsured.

The growing interest in oncology during the 1970s led in 1979 to a regional organisation, the Cooperating Association of Hospitals in Oncology (SOOZ). In 1982 the Comprehensive Cancer Centre South (IKZ) was founded as a collaborative effort of the radiotherapy institutes in Eindhoven and Tilburg and 18 community hospitals, one of its main tasks being cancer registration.

Access to clinical specialists was good but deteriorated a bit until 2000, generally through general practitioners, one for every 2200 persons. Despite a markedly ageing population the number of hospital beds decreased from 5 to 2.0 per 1000 persons in the past 25 years, while the number of nursing home beds has increased, as has, more recently, home care provision. In the late 1990s, hospitals halved in number by mergers to only middle- and large-sized hospitals from 400 to 800 beds.

Registry structure and methods

This regional registry began operation in 1955 as part of a programme for nationwide cancer registration. The 13 participating hospitals of the 1970s have now been merged into 6. The registry has always cooperated systematically with up to three regional pathology laboratories, which have paraffin-embedded blocks of biopsy specimens from all patients since the 1970s. These laboratories also serve GPs. Moreover, through the various medical records departments the registry has access to the medical records of most hospitals, in particular in the department of Radiotherapy in Eindhoven, which has gradually extended service to all of these hospitals. Since 1988 the registry has functioned within the scope of a national scheme for cancer registration, developed since 1984. Assessment of completeness and accuracy was carried out in the period 1980–83 with continuing support from the Department of Epidemiology, now Public Health, of Erasmus University, Rotterdam. Extensive analyses of incidence since 1958 thus became possible, e.g. for lung and breast cancer, both of which exhibited major changes. Such data have now been submitted to Cancer Incidence in Five Continents since 1958 and EUROCIM since the early 80s. They include—in a large part of the area—non-melanoma skin cancer, based on early involvement of also dermatologists.

Using the municipal population registers, active follow-up with respect to vital status was performed in 1987, 1991, 1994, 1999, 2002 and 2006. Patients lost to follow-up declined from 5% to less than 1%, with regular aid from the Central Bureau of Genealogy.

Interpreting the results

Screening for cervical cancer, started during the 1970s but declining in the 1980s, started again in 1988, being adapted in 1996 among women 30–60 years of age at 5-year intervals. Biannual mass mammography screening for breast cancer gradually started among women between 50 and 70 years during 1992–96, rising to age 75 in 1998.

Use of the data

Regular overviews of trends in incidence, stage and survival of patients registered since 1958 are published every five years, including detailed information on uncommon tumours and prevalence since 1970 and co-morbidity at diagnosis

since 1993. Cancer survival has also been studied since 1978 within the framework of the EUROCARE study.

In recent years the data have been used increasingly for quality-of-care purposes and studies of cancer in the elderly; for that purpose, serious co-morbidity at diagnosis was also registered and a research department developed with a strong regional, national and European orientation.

Source of population
Population data are calculated annually for 1 January; they are derived by Statistics Netherlands from the municipal population registries.

Multiple primary rules used
IACR rules (2004) on historical data.

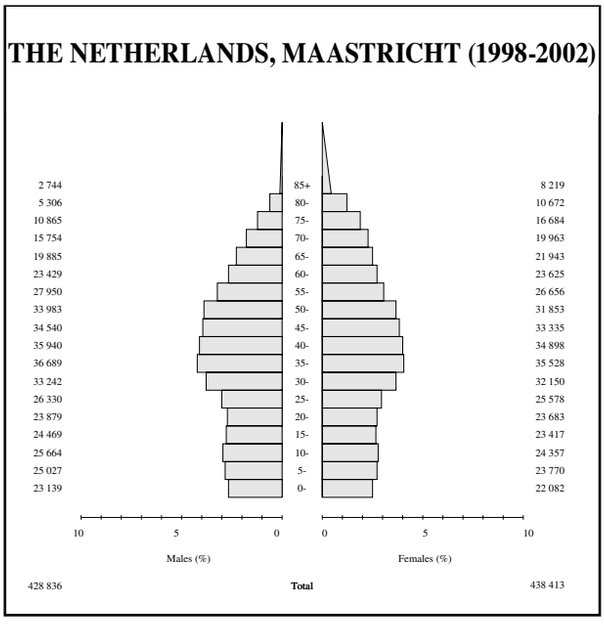
The Netherlands, Maastricht

Registration area
The Maastricht Cancer Registry is situated in the southeastern part of The Netherlands, and comprises the southern and middle parts of the province of Limburg, an area of some 1355 km^2. A large area to the west, south and east is bordered by Belgium and Germany. The Eindhoven Cancer Registry is on the northern boundary.

In the southern part of Limburg, the population density is very high, with about 30% of the population living in rural municipalities, 57% in sparsely and moderately urbanised municipalities and 14% in densely urbanised municipalities.

Current industrial activities in the region include chemical, automobile, ceramic and cement industries. Until 1975, coal mining was a very important source of employment.

The vast majority of the Limburg population is Catholic.



Cancer care facilities
There is easy access to medical care in the Netherlands. In the province of Limburg there is about one general practitioner (GP) per 2300 inhabitants. Medical specialists usually work at the hospitals: they can be consulted after referral by the GP. Due to the ageing population, cancer care facilities will be consulted more frequently in the future. Almost all cancer patients are diagnosed and treated by medical specialists. In the area of the Maastricht Cancer Registry, there are four general hospitals and one university hospital. The area also has one radiotherapy institute.

Registry structure and methods
The Maastricht Cancer Registry was established in 1984 as part of the Comprehensive Cancer Centre (CCC) Limburg. Within CCC, there is collaboration between the hospitals, Maastricht University and the Maastro Clinic (radiotherapy institute). The aim of the CCC is to improve care for cancer patients through research, treatment, guidelines and coordination of regional activities (e.g. cancer screening).

The Maastricht Cancer Registry (MCR) is part of the nine regional cancer registries in the Netherlands. Together these registries make up the Netherlands Cancer Registry.
The staff of the registry includes one epidemiologist as head of the registry, two epidemiological researchers, one computer programmer and six tumour registrars. In addition, one consultant on cancer registration is available.

Notification is voluntary. The cancer registry receives lists of newly diagnosed cases on a regular basis from the four pathology departments in the region. In addition, the medical records departments of the five hospitals provide lists of hospitalised cancer patients. Following notification, the medical records of newly diagnosed patients are collected and trained tumour registrars for the cancer registry abstract the necessary information from them.

Death certificates cannot be used because of the privacy regulations of the Dutch Central Bureau of Statistics. Tumour data are copied onto registration forms at the hospitals and entered into the computer at the registration office. Completeness of records, data consistency and the possibility of duplicate records are continuously and extensively checked by the computer program.

Interpreting the results
Research into the completeness of ascertainment and into the validity and accuracy of data show that the quality of the data is high (Int J Epid 1993;22:369-76, Br J Cancer 1993; 68:947-77, Int J Epid 1994 23;1111-6).

In 1990 a breast cancer screening programme started, resulting in a large increase in the incidence of breast cancer. A cervical cancer screening program started in 1992 and expanded to the whole region in 1996 for women aged 30–60. Trends in prostate cancer incidence also show a large increase, associated with opportunistic PSA screening.

Use of the data
The registry regularly publishes a report on cancer incidence. Data for the Maastricht Cancer Registry have been used for etiological research, evaluation of guidelines, evaluation of screening programmes and the treatment of cancer in the elderly. The data are also used to plan healthcare facilities.

Source of population
Statistics Netherlands.

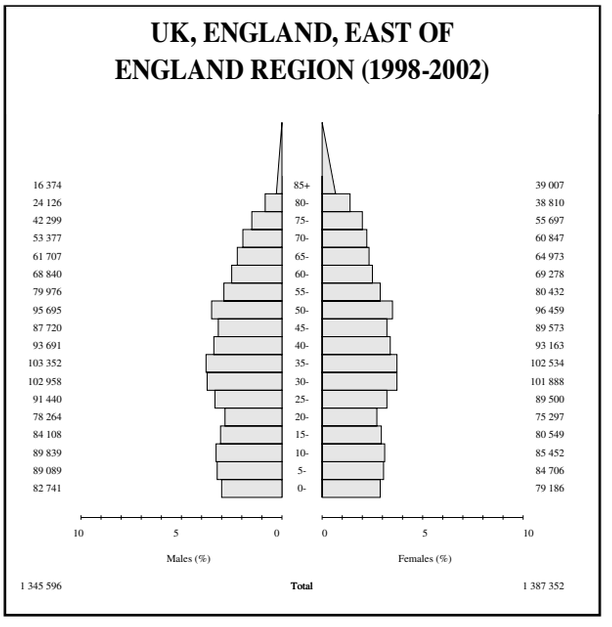
Multiple primary rules used
IACR rules (2004) on historical data.

UK, England, East of England Region

Registration area
ECRIC registers cancers occurring in the resident population of Norfolk, Suffolk, Cambridgeshire and, since 1996, Bedfordshire. It is situated in eastern England UK with a population (at the most recent census) of 2.75 million; 90% of the population describe themselves as white British.

In 1995 the registry assumed responsibility for the resident population of Bedfordshire, and in 2006 responsibility for Hertfordshire and Essex was added. As a result of this, the population covered increased from approximately 2.2 million to 2.6 million in 1995, and from 2.8 million to 5.3 million in 2006.

Cancer care facilities
The registry is situated in Addenbrooke's NHS Trust Hospital in Cambridge, with 2 satellite offices in The Norfolk and Norwich University Hospital in Norwich and the Ipswich Hospital. Each of them has radiotherapy, oncology and surgical facilities. There are 6 other hospitals in the region providing oncology services. Some patients are sent out of the area to receive radiotherapy treatment at Mount Vernon Hospital, Northwood, Middlesex.



Registry structure and methods
The registry is funded by the government Department of Health under the Public Health budget. There are 24 staff as follows: Director, operations manager, consultant oncologist, two senior registration officers, 11 registration officers, two clerical officers and three workers each in analysis/quality assurance and IT.

Registry staff extract data from patient's notes and hospital PAS systems at all the hospitals in the region. Data are recorded on paper forms and later transferred to a computer database when complete.

A monthly updated "snapshot" of the database is produced using Microsoft Access for the analysis team to interrogate to produce reports and answer specific queries from external sources.

A detailed formal evaluation of Annual Performance Indicators is already carried out according to the guidelines established by the UKACR.

Interpreting the results
PSA testing is quite common, and parts of the registry population are included in a large-scale study evaluating screening for prostate cancer.

Multiple primary rules used
IACR rules (2004) on historical data.

UK, England, Merseyside and Cheshire

Registration area
Since 1974, the registry has collected data on all cancers occurring in residents of Merseyside and Cheshire, wherever treated, and on residents of other areas treated in Merseyside and Cheshire hospitals. The registry also collects data on Isle of Man residents.

Population centres in the area include the city of Liverpool; industrial towns such as Birkenhead (previously shipbuilding), Runcorn (chemicals), St Helens (glass); the retirement coastal town of Southport; and the rural towns of Cheshire.

Cancer care facilities
Local Cancer Services have been reorganised into networks with a specialist cancer centre (containing full radiotherapy and oncology facilities) and cancer units in a "hub and spoke" arrangement to achieve the most effective concentration of expertise and also obtain the closer involvement of primary care.

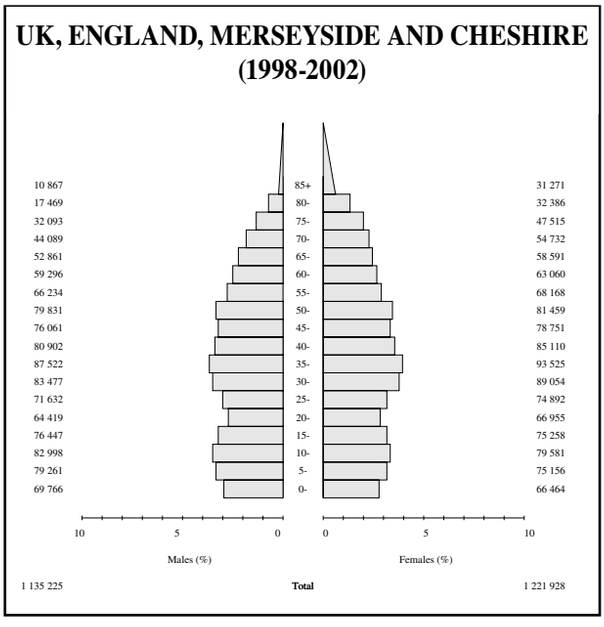
Registry structure and methods
The registry was founded in 1944 as the Liverpool Clinical Cancer Registry, with the primary objective of registering all cases of malignancy occurring in the area served by the Liverpool Radium Institute. It extended its coverage to the surrounding area in 1974. The registry is part of the National Health Service.

Registry staff comprise: a medical director, a general manager, two deputy managers, an epidemiologist, a secretary, a quality assurance officer, an IM&T officer, an intelligence officer, 6 registration officers and a database specialist. In addition, project work is undertaken by students studying for higher degrees and professional examinations.

The most important source of notification is pathology reports, copies of which are routinely sent to the registry. All cases are followed up by trained registration officers, who abstract relevant clinical information from hospital records. Notifications are also received from the Office for National Statistics about death certificates for people who have died of cancer. Full registration for these cases is then sought by Merseyside and Cheshire Cancer Registry from the hospital or certifying doctor. The local specialist centres for oncology also supply notifications. Details of Merseyside and Cheshire residents whose cancers are diagnosed elsewhere are supplied by the local registry. Cases registered during life are flagged at the National Health Service Central Register so that the cancer registry is informed when these cases die.

Registry data are held on a dedicated relational person-based system. Each tumour is allocated a unique tumour number in addition to the patient's unique identifier. Validation checks within the system were extended in 1994 to improve the quality of data inputting. The registry has a rolling programme of quality assurance focussing on the ascertainment, completeness, timeliness and "housekeeping", and several projects have explored different aspects of data quality. Data are coded in ICD-0-2, kept securely and released in a controlled manner, in accordance with ethical and data protection conventions. Regular backups are taken of the data and kept both locally and off-site.

Interpreting the results
There have been no coding or registration practice changes that affect the interpretation of the data in this report compared with earlier volumes.



Organised screening programmes are in place for breast and cervical tumours. In 1988 a national breast screening programme was introduced, through women aged 50–64 years are routinely invited to be screened for breast cancer every three years; women above 64 years are screened if they, or their general practitioners, request a test. A similar screening programme for cervical cancer was introduced in 1964, whereby all women aged 20-64 are screened, currently every three to five years, depending on their primary care trust and their age.

The increasing use of opportunistic PSA testing within Merseyside and Cheshire coincides with an increase in the number of prostate cancer cases registered locally.

Use of the data
Publications include specialist reports on breast cancer (2003), colon cancer (2003) and oesophageal cancer (2003).

Other output includes responding to over 80 ad hoc queries annually; presentations concerned with place of death and also cervical screening age; audits with specialist researchers; responding to genetic counselling service enquiries; contributions to the regional public health report; analyses to support the planning of local cancer services; and regular presentations to specialist groups.

Source of population
Estimation of population at risk based on 2001 census, allowing for births and deaths and migration into and out of the area.

Multiple primary rules used
IACR rules (2004) on historical data.

Notes on the data
C44 not available.

UK, England, North Western

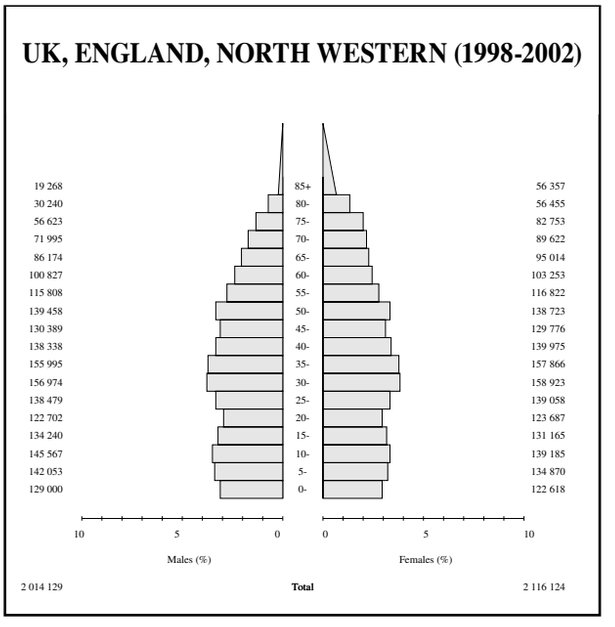
Registration area
The North Western Cancer Registry (NWCR) collects data on all residents of Greater Manchester, Lancashire, South Cumbria and a small part of Derbyshire who develop cancer. The Registry covers an area of 4500km^2 and has a population of four million. Sixty-five percent of the population resides in the conurbation of Greater Manchester, which is almost entirely urban. The remainder of the region is of mixed urban-industrial and rural character. Eleven percent of the population lives in areas adjoining the coast, which are characterised by a high proportion of elderly retired residents. Ethnic minority groups comprise almost 8% of the North West population, concentrated mainly in large cities.

Cancer care facilities
Local cancer care services are being reorganised into networks with a specialist cancer centre (containing full radiotherapy and oncology facilities) and cancer units in a 'hub and spoke' arrangement to achieve the most effective concentration of expertise and obtain closer involvement of primary care.

Registry structure and methods
The NWCR was founded in 1962. It is situated at the Christie Hospital, the principal cancer centre serving the Region.

Registry staff comprise a medical director, office manager, systems manager, epidemiologist, information manager, systems analyst, deputy manager, quality assurance officer, one secretary, and eight cancer registration officers.

The vast majority of patients receive their hospital care in the National Health Service hospitals. All NHS and private hospitals use special form to notify the Registry of all cases of cancer diagnosed in patients admitted to their hospital. The registries of other regions notify the Registry of residents of the region who are treated in hospitals outside the region. The Registry also receives data from hospital information systems. The Registry has links with all pathology laboratories in the region so that copies of pathology reports can be sent directly to the Registry. The Registry receives copies of death certificates of all regional residents whose certificate mentions cancer. The Registry collects further information on patients identified only by a death certificate.



Cases are followed up through the statutory registration of deaths. All patients are flagged at the National Health Service Central Register and the Office for National Statistics informs the Registry of patients who have been previously flagged as having developed cancer.

All addresses are assigned post-codes, and all information is computerised and submitted to validation and consistency checks. Diagnostic details are entered on the computer, which then automatically codes them to ICD-O. Validation checks within the system were extended in 1994 to improve the quality of data input.

Interpreting the results
There have been no coding or registration practice changes that affect the interpretation of the data in this report compared with earlier volumes.

Use of the data
A number of reports have been published examining variations in cancer incidence and survival in the population covered by the Registry. A joint report with the Merseyside and Cheshire Cancer Registry (MCCR) covering the whole of the North West Region has been published. Registry data are used to plan and evaluate cancer services, including the breast and cervical screening programmes. A number of audits using Registry data have been undertaken. Several research studies, both national and international have used Registry data. In addition, Registry staff have collaborated on several studies on a range of topics, including the genetics of breast cancer and the reasons why women with bladder cancer have a worse prognosis than men.

Notes on the data
C44 not available.

UK, England, Northern & Yorkshire

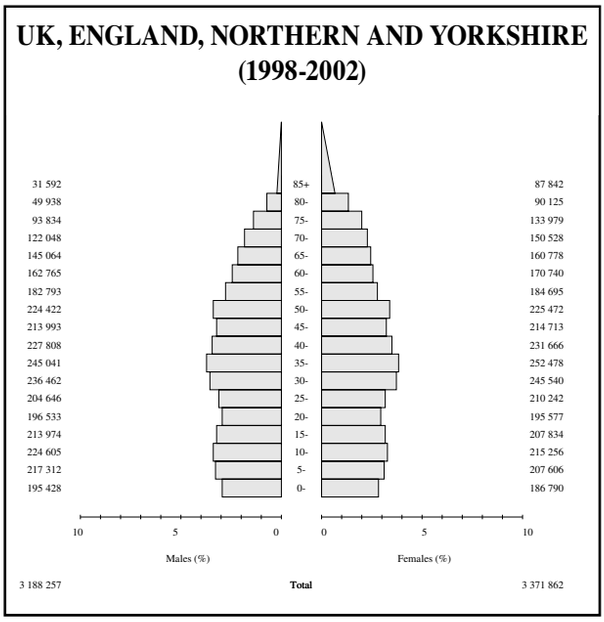
Registration area

The area covered by NYCRIS (Northern and Yorkshire Cancer Registry and Information Service) is a little under 30 000 km^2, and includes much of the North of England: from North Cumbria to Northumberland (Scottish border), down to West Yorkshire (east of the Pennines) and across to Humberside and the North Lincolnshire Coast.

The region comprises the large rural expanses of the Northern Lake District, Northumberland, County Durham, West, East and North Yorkshire. Within these are several densely populated urban clusters, including Tyne & Wear/ Teesside, Leeds/Bradford, Huddersfield/Calderdale and Humberside, along with some smaller (formerly fortified) cities, such as York, Durham and Carlisle. Health geography, for 1998–2002, maps the area directly to four Cancer Networks or 44 Primary Care Trusts (PCTs).

Total population is around 6.7 million (at 2001 census), which constitutes 12.4% of the population of England & Wales. There is marked variation in population density across the region, varying from 0 to over 2500 people/km^2 in Hull & Stockton-on-Tees (www.statistics.gov.uk/regionalsnapshot/). Ethnic groups include Black 0.4%, Asian 3.4%, and Other 0.4% (% of total population, 2001 census).

The age structure is not significantly different from that of England and Wales as a whole, although the percentage aged 25–35 years is slightly higher.



Traditional industries include shipping, fishing, textile & clothing manufacture, steel production, shipbuilding and coal mining.

Cancer care facilities

The vast majority of patients receive their hospital care in National Health Service (NHS) hospitals. A major national reorganisation of cancer services has taken place since 1995, following the report of an Expert Advisory Group on Cancer to the Chief Medical Officers of England and Wales. The subsequent National Cancer Plan (2000) established a system of Cancer Networks each serving populations of 1–3 million and organising specialist cancer care through multidisciplinary teams. There are four such networks in the NYCRIS region, based around hospitals in Newcastle, Middlesbrough, Leeds and Hull, which, together with their associated local units in smaller district hospitals, provide integrated cancer services for their populations. The hospitals within these 4 cities are the cancer treatment centres; there are radiotherapy departments located proximate to the treatment centres.

Registry structure and methods

NYCRIS was set up in 1997 to integrate the two separate regional cancer registries of Northern and Yorkshire. Due to the quality of pre-1998 Northern data, only Yorkshire cases have been included in earlier volumes of CI-5.

NYCRIS is based in Leeds, adjacent to Cookridge Hospital, which is part of Leeds Cancer Centre. It currently employs around 50 staff, of whom approximately 60% are involved in data collection and validation (for the whole of the Northern and Yorkshire area), 15% in data management/ quality assurance and 15% in information and research.

Cancer registration in the UK is mandatory, and cases diagnosed in hospitals (inpatient and outpatient) are notified directly to NYCRIS. All pathology laboratories throughout the region routinely send copies of pathology reports, and these act as a cross-reference to information received directly. Northern & Yorkshire residents treated outside the region are notified by other cancer registries. Notification also comes from Breast Screening Units and hospices. Cases are registered by registry staff who visit the hospitals and abstract treatment details from hospital case notes following primary notification. Copies of death certificates are routinely received from National Statistics for all cases where cancer is a cause of death. When this information is the first notification of cancer, the registry traces the death to search for further information. When the cause of death is non-malignant, the registry is notified by the National Health Service Central Register, where all registered cancer patients are flagged.

A new registration system (PRAXIS) was implemented in 2006 to enable NYCRIS to move from the current, largely manual, cancer registration process to one making greater use of electronic data feeds. The cancer registry database is patient-based. Records of existing registrations are updated with new information, new cases being assigned an accession number by the computer. All data items are encoded by the computer. The system also automatically generates a general practitioner's enquiry letter, a cancer registration document and a follow-up enquiry letter where necessary. At the point of entry, data are validated using the National Statistics edit procedures. Data are regularly exchanged with local specialist tumour registers to ensure complete ascertainment.

Use of the data

In addition to providing a responsive information service, NYCRIS regularly produces data and reports in a variety of media and actively promotes the use of its data. Summary statistical information (incidence, mortality and survival) is contained in CIS (Cancer Information Service), a web-based analytical tool available over NHSnet (protected health service WAN).

Details of CIS and all of its published reports are available on its web site (www.nycris.org.uk). In addition NYCRIS has conducted a series of regional audit reports,

on important issues related to cancer service delivery; for example, analysis of variation in the patterns of cancer care and the effect of such variation on survival, an examination of methods to improve the registration of skin cancer and analyses of patient waiting times before receiving treatment.

Source of population
UKACR Populations Dataset Version 3.

Multiple primary rules used
IACR rules (2004) on CI5 IX periods.

UK, England, Oxford Region

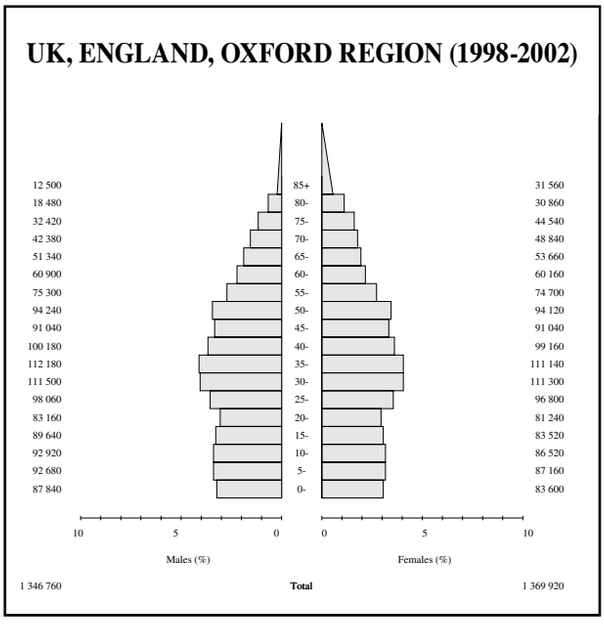
Registration area

The Oxford region consists of the counties of Berkshire, Buckinghamshire, Northamptonshire and Oxfordshire, and covers a population of about 2.7 million people. There are slightly more females than males (51%/49%). During the last 20 years higher population growth has been experienced within major urban areas.

Berkshire has the highest population with 800 100 residents, Buckinghamshire has 686 100, Oxfordshire has 605 500 and Northamptonshire 629 700. Oxfordshire has the highest proportion of elderly residents, with 14.5% being 65 or over. Northamptonshire has 14.2% of over-65s, Buckinghamshire has 13.3% and Berkshire 12.7%. Around 13% of the population are aged under 10, about 13% are aged between 20 and 30 and 6% are aged 75 or over.

Berkshire has more residents from Black (African, Caribbean or other), Indian, Pakistani, Bangladeshi, Chinese, or other minority ethnic groups (including other White ethnic groups) than the other counties, accounting for 15% of its population. Buckinghamshire has 11.4% Black and minority ethnic citizens, Oxfordshire 8.8% and Northamptonshire 6.7%.

In general, the regional population is healthier and less deprived than those living in many other parts of England. There are, however, pockets of deprivation in some parts of the Region and there are higher rates of diseases (e.g. breast cancer) associated with a higher social class distribution.



Cancer care facilities

Cancer services are organised by the Thames Valley Cancer Network for Berkshire, Buckinghamshire and Oxfordshire, and by the Leicestershire, Northamptonshire and Rutland Cancer Network for Northamptonshire. Within the area there are eight hospitals providing cancer care; three of these have radiotherapy facilities.

PSA (prostate specific antigen) testing has been common within the area since the early 1990s, but there are currently no routine data on levels of testing.

Registry structure and methods

The registry is centrally funded by the Department of Health. There are 15 full-time-equivalent staff members, with 5.5 in the registration section, 4.5 information analysts, 4.0 IT and business support, and a part-time Medical Director.

Cancer registration data have been collected on a regional basis since 1952. The registry is notified of cases by histopathology and cytopathology laboratories and medical records departments. Death certificates where cancer is mentioned are also passed to the registry from the Office for National Statistics (ONS). In addition, all registered cancer patients are flagged on the NHS Cancer Register to ensure that the local registry is informed of deaths among the registered population, including those from causes other than cancer and those occurring outside the region. There is collaboration with specialist registers (e.g. Childhood Cancer Research Group, Oxford Regional Leukaemia Register) and directly with clinicians to collect certain types of data.

The registry collects data on all malignant tumours, *in situ* neoplasms and certain benign tumours. An abstract of each tumour record is passed to ONS for inclusion in the National Cancer Registration Scheme. Information on non-residents treated within the Oxford Region is passed to the appropriate regional registry and is part of a reciprocal arrangement.

Until 1992, the process of registration was entirely manual. In September 1992, a Hewlett Packard 9000 RISC minicomputer system was installed running Unix, Informix, SQL and the C-Cris 1 Cancer Registration System. Currently electronic versions of pathology reports (abstracted by identifying all cancer SNOMED codes) with demographic details separately identified are received from all laboratories. Electronic downloads from Casemix/Patient Administration Systems and from Oncology systems are received from all provider sites. Ox-link record matching software is used to distinguish new registrations from amendments or non-registrable cases. Demographic details of new registrations are added automatically to the file. Clerks then add the diagnosis and treatment details.

Interpreting the results

All borderline malignant tumours were included in downloads from anniversary year 1993. Prior to this, apart from one or two tumour types (i.e. polycythaemia vera) with a fifth digit of 1 (borderline malignant), they were not collected.

There were significant changes to the UK practice of bladder coding from anniversary year 2000. This meant that bladder cases diagnosed as papillary non-invasive transitional cell carcinoma—grades I and II—which had previously been coded as malignant (pathology reports also reported them as 81303 - malignant) were now to be coded to a borderline code. This had quite an impact in the number of malignant cases reported; the malignant cases reduced in number and the borderline cases rose significantly. It was also agreed at the same time that papillary non-invasive transitional cell carcinoma grade III was to be coded to 'in situ'.

Use of the data

The Oxford Cancer Registry is now part of the Oxford Cancer Intelligence Unit (OCIU). OCIU is responsible for cancer registration, for providing a cancer information

service, managing quality assurance and evaluation of the breast and cervical screening programmes in the Region and undertaking and contributing to programmes of clinical audit and research. The registry contributes to the annual UK Association of Cancer Registries review of the completeness and accuracy of registry data.

Source of population
Mid-year estimates based on censuses in 1991 and 2001 (Office for National Statistics).

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

UK, England, South and Western Regions

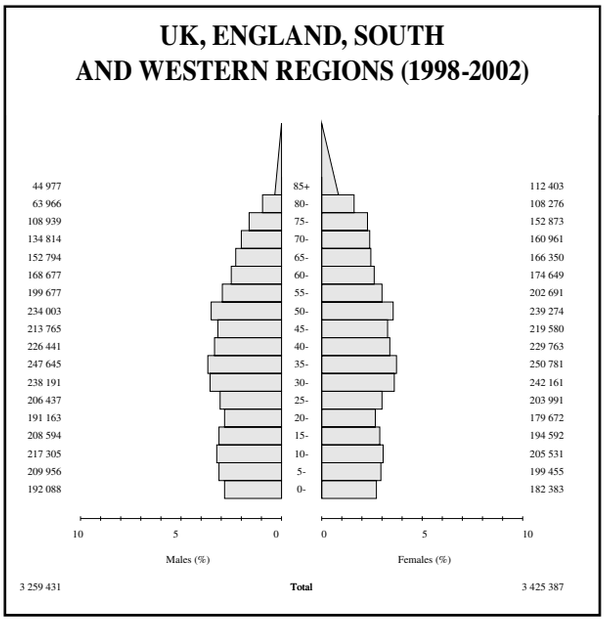
Registration area
The South West Cancer Intelligence Service (SWCIS) collects data on all cancers and suspected cancers for the South West region of England, including Hampshire and the Isle of Wight. In all, it covers an area some 300km by 100km, with a coastline of over 1400km. The population of 6.8 million is nearly all white Caucasian and predominantly Christian, with an approximate 60/40% split between urban/suburban and rural. A large proportion of the population (approximately 20%) are retired.

Cancer care facilities
The SWCIS area is served by 12 main hospitals, within which there are seven designated cancer centres. There are a further eight regional hospitals with Accident and Emergency (A&E) departments and significant treatment facilities, as well as numerous small hospitals for minor injuries and recuperation.

Registry structure and methods
The SWCIS is one of nine regional registries in England. It is split between two sites, one in Bristol (mainly data users) and one in Winchester (mainly registration and IT). The SWCIS is funded by government, through the Department of Health.

In 2005 the SWCIS merged with the South West Public Health Observatory (SWPHO). The aim of the SWPHO is to provide a seamless public health intelligence service for the region. The SWCIS employs 17 registry staff, 4 information analysts, 5 clinical audit team members, and 5 Network Liaison Officers who provide an important link between the registry and cancer networks. Their work is supported by Business Management, IT and Publications and Communications teams who work across the whole organisation.

The SWCIS collects its data from three principal sources: Hospital Patient Administration Systems (Clearnet); pathology laboratory reporting systems, and the national deaths database. These are accessed via electronic capture and processing with manual intervention to resolve complexity or data conflict. Over 75% of records are initially electronically captured with more than two independent sources usually involved. Eight subsidiary data sources include: private hospitals, military hospitals, cancer screening centres, follow-up with consultants, audit databases, other cancer registries, cancer/treatment centre databases and national research centres.



Interpreting the results
The coverage provided by the above range of sources, and verified by checks made through audit, is over 99%. Death Certificate Only registrations are less than 3%.

The UK runs screening services of more than ten years standing for cervical and breast cancer.

The registry has only recently started registering skin cancers of basal cell carcinoma (BCC, C44) due to the large numbers and limited interest in this type of cancer in the past. C44 were not collected systematically until 1998. For BCC and Squamous Cell Carcinoma (SCC) only the first primary diagnosis is registered. Cervix *in situ* D06 is incomplete for all areas. Registration of D45 is incomplete until 2001/2002. Bladder C67/D41 coding was changed in 2000. Some 80% of cancer registrations are supported by pathological confirmation. The incidence of prostate cancer has risen dramatically in parts of the registry area since 2001. This has largely been attributed to increased PSA testing.

Use of the data
There are five principal ways in which our data are made available:

The SWPHO website (www.swpho.nhs.uk). This site is accessible to all for epidemiological statistics of the important cancers and information on cancer epidemiology.

An ad-hoc information request service. Each year the SWCIS deals with over 200 information requests by phone, email, fax or letter from a wide range of health professionals and others. Regular users of the service are strategic health authorities, consultants, medical students, clinical audit, research bodies and the media.

To government via data exchange. A regular download of new and updated registrations is sent to the National Registry (ONS) for Government publication.

Publications. Cancers of special interest, patterns of treatment, and health service facility usage are regular topics of reports.

Collaborative research. The SWCIS works with a variety of partners including Cancer Networks on a range of topics to produce varied outputs including audit, new databases, follow-up studies and treatment effectiveness have all been covered in recent years.

Source of population
Mid-year estimates based on censuses in 1991 and 2001 (Office for National Statistics).

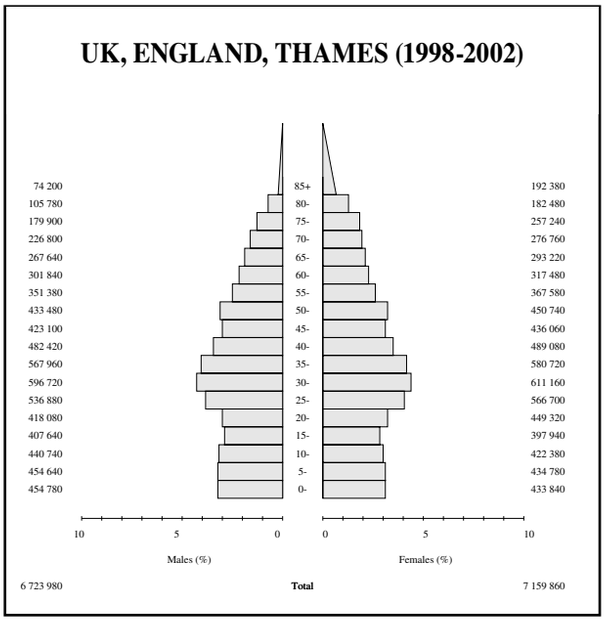
Multiple primary rules used
UKACR rules (1998).

UK, England, Thames

Registration area

The Registry was founded in 1958 as the South Metropolitan Cancer Registry, became population-based in 1960, and was renamed the South Thames Cancer Registry in 1974. Until 1984 it covered the South East and South West Thames Regional Health Authority areas (the South Thames Health Regions), with a population of approximately 6.8 million. In 1985 the Registry expanded to include the North Thames Health Regions, becoming the Thames Cancer Registry (TCR) and covering, in 2000, a population of approximately 14 million across the counties of Hertfordshire, Essex, London, Surrey, Sussex and Kent. Data in this volume cover this population, and have been submitted for diagnosis years 1985–2002. Previous volumes have covered the South Thames Health Regions only.

The Registry region includes some of the most affluent areas in England, and also some of the most deprived. London has an ethnically diverse population. In the 2001 census, 17% of the TCR population were not classed as white, compared with 9% in England.



Cancer care facilities

The majority of cancer patients are treated within the National Health Service (NHS). The Registry region is covered by 13 NHS Cancer Networks and more than 50 NHS secondary and tertiary care trusts. The Cancer Networks co-ordinate cancer care.

Most patients are diagnosed and treated in a secondary care trust. Patients with rare cancers and those requiring specialised care are referred to a tertiary care trust. There are 22 radiotherapy centres in the area, 19 NHS and 3 private.

Registry structure and methods

The Registry is located on the Guys Hospital campus at London Bridge, and is a department in King's College London School of Medicine. It is funded through a contract with the Regional Director of Public Health in London.

The Registry has approximately 70 staff. Thirty mobile staff actively abstract registration information from hospital medical records. The other 40 staff, at the London Bridge office, perform data entry, computing, quality assurance, analysis, reporting, research and management functions.

Principal sources of information on cancer cases are pathology reports and information systems, paper medical records, hospital patient information systems and death certificates.

Death certificates are provided electronically to the Registry by the Office for National Statistics. Certificates are provided for registered patients, and for all people dying in the Registry's catchment area from or with cancer.

The Registry collects patient identifying information. Special provision within the Health and Social Care Act 2001 enables the Registry to continue this practice without the direct consent of patients. Cancer is not a notifiable disease in the UK.

A wide range of data validation checks are applied by the Registry's computerised registration system at the time of data entry/import. Automated retrospective validation checks are made daily. Patient deduplication is done annually. The Registry regularly reports and monitors the stability of its case ascertainment and data and process quality indicators. The Registry participates in the quality assurance activities of the United Kingdom Association of Cancer Registries, which formally evaluate the Registry's stability, data quality and completeness.

Interpreting the results

Previous volumes have reported incidence in the South Thames Health Regions only. The data in the present submission cover the residential population of South East England (the counties of Hertfordshire, Essex, London, Surrey, Sussex and Kent) in the period 1985–2002. This is the territory of the (now historic) North and South Thames Health Regions.

There are organised national screening programmes for breast and cervical cancer. The Registry exchanges data with the breast-screening programme. Prostate-specific antigen testing is common in the Registry's population, and this has led to increased rates of prostate cancer, particularly in men under 70 years of age.

Use of the data

A range of reports are provided for health organisations in the Registry's region. Research activity and output in the Registry have increased in recent years. The Registry contributes data to a regional Cancer Information Service available online to NHS users. The Registry recently prepared national long-term cancer incidence predictions for the Department of Heath. For further information, see http://www.tcr.org.uk/.

Source of population

The population table has been extracted from national population files produced by the Office for National Statistics (ONS). It details the population of the Thames Cancer Registry diagnosis years 1985-2002 catchment area for the calendar years 1985-2002. National censuses were held in 1981, 1991 and 2001. The 1991 and 2001 populations in this table are from the censuses in those years. The populations for the other years in the file are mid–year estimates based on census data.

Multiple primary rules used

IACR rules (2004) on historical data.

UK, England, Trent

Registration area

The Trent region covers the counties of Derbyshire (except its north-west tip), Leicestershire, Rutland, Lincolnshire, Nottinghamshire and South Yorkshire, an area of 14 763 km^2 with a resident population of 4.8 million. The area is served by 11 Acute Trusts, 12 Primary Care Trusts and three medical schools (Leicester, Nottingham and Sheffield). It spans two Government Office Regions (Yorkshire and the Humber, and East Midlands) and is the lead Cancer Registry for providing information to four Cancer Networks (North Trent, Mid Trent, Derby/Burton, Leicestershire, Northamptonshire and Rutland). Cancer Centres are located in Derby, Leicester, Nottingham and Sheffield, where radiotherapy and chemotherapy services are available. United Lincolnshire Hospitals NHS Trust is a cancer unit with radiotherapy services.

Despite variations within the region, the overall Trent population profile is comparable with that of England. Forty percent of Trent local authorities are in the two most deprived quintile groups for the whole of England, compared with 35% in the two least deprived quintile groups. Just less than 75% of the resident population live in urban areas. The ethnic profile of the population is predominantly White (93.7%), with sizeable numbers from Asian ethnic groups (3.9%), most notably Indian (2.5%).

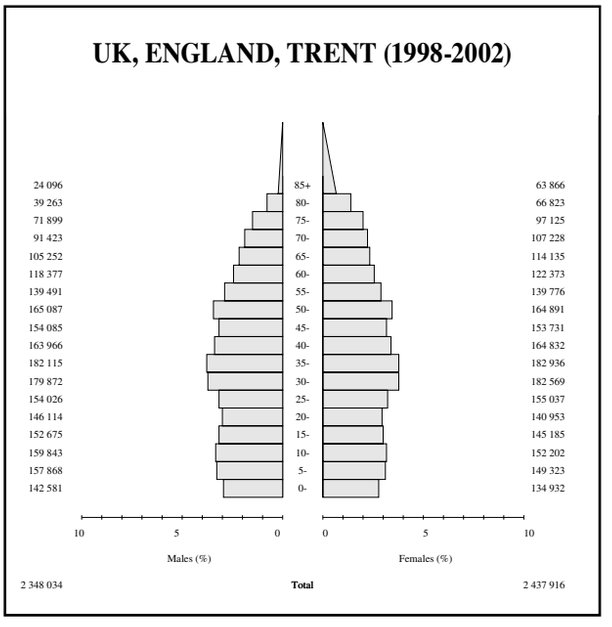
The area covers a variety of industry. The decline of the coal and steel industries over the last thirty years has led to considerable economic re-development with heavy industry being replaced with light engineering and service industries. Textiles and the pharmaceutical industry also have a strong hold in the region. Many of the rural areas support farming, food production and tourism.

Routine breast and cervical screening programmes operate in the Trent Region. Roll-out of the regional bowel cancer screening programme commenced in March 2007 at the Derbyshire Screening Centre, and completion is planned for 2009. The NHS Prostate Cancer Programme was launched in 2000 and testing for prostate cancer is now available on request to men aged over 50 years on an informed choice basis.

Registry structure and methods

Cancer registration in the Trent region began in 1955. Since then there have been a number of significant changes and reconfigurations that have resulted in the organisation we see today: Most recently, in 2003, the Registry moved to the current premises in Fulwood, Sheffield and in 2005 benefited from a merger with the East Midlands Public Health Observatory giving greater opportunities for joint working and significantly expanding the type of work/projects the registry is able to undertake.

Trent Cancer Registry collects a common minimum dataset on cancer. Cases diagnosed in hospitals (inpatient and outpatient) are notified to the registry electronically, including details taken from pathology reports. Other cancer registries notify the registry of Trent residents treated outside the region. Copies of Death Certificates are routinely received from the Office for National Statistics (ONS) for all cases where cancer is a cause of death. When the cause of death is not cancer related, the registry is notified by the National Health Service Central Register, where all registered cancer patients are flagged.



On receipt, data are validated using extensive edit procedures (incorporating those of the ONS), and checked for duplicate registrations and identification of patients with multiple primaries. Formal evaluation of the completeness and accuracy of information recorded by Trent Cancer Registry is ongoing as part of the UKACR National Cancer Peer Review Programme. This aims to improve the processes, timeliness, quality and provision of cancer information.

The current database holds records from 1966 comprising more than 900 000 individual registrations from across the Trent Region, with approximately 35 000 new registrations (malignant and non-malignant) each year. At intervals, new registrations are abstracted and sent to ONS to update the national system.

Use of the data

Data are used for a variety of purposes, in particular, responding to local health requests for information to support the effective provision of cancer services, use in studies both locally and nationally, providing information to support genetic counselling service enquiries, and responding to ad hoc requests as appropriate.

Some statistics, further details and also information about reports and other publications, can be found on the Trent Cancer Registry Website: www.trentcancer.nhs.uk

Source of population

UKACR Populations Dataset Version 3.

Multiple primary rules used

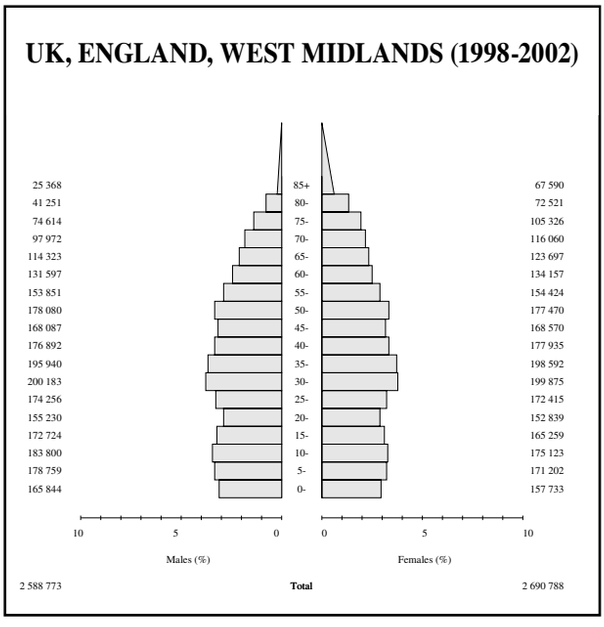
UKACR rules (1998).

UK, England, West Midlands

Registration area

The West Midlands registration area covers a population of 5 300 000 people in 2002, just over 10% of the total population of England. There are marked differences in population density across the region, with very densely populated urban areas and more sparsely populated rural areas. Non-white residents make up 11% of the total West Midlands population, with the largest ethnic groups being Indian (3.4%), Pakistani (2.9%) and Black Caribbean (1.6%) (2001 census). The percentage of non-white residents is considerably higher in some areas of the West Midlands such as Birmingham (30%), Wolverhampton (22%), Sandwell (20%) and Coventry (16%).

In April 2002, the West Midlands region was divided into three Strategic Health Authorities, but in October 2006 these were amalgamated into single Strategic Health Authority covering the whole region. There are five cancer networks covering the West Midlands population. Three (Arden, Pan Birmingham and the Greater Midlands Cancer Networks) are entirely contained within the West Midlands; the Derby/Burton and 3 Counties Cancer Networks also include residents of other registration areas.



Cancer care facilities

There are 18 acute hospital NHS Trusts within the West Midlands, all of which diagnose and treat cancer patients. Five of these are cancer centres providing radiotherapy. A relatively small number of cancers are diagnosed in private hospitals, nursing homes and hospices. The WMCIU receives diagnostic and treatment information from all of these organisations.

Whilst there are no routine data available on the rates of PSA testing in the West Midlands, there has been a large increase in prostate cancer since the late 1980s, when the PSA test was made widely available. Furthermore, this increase is much greater in the most affluent men.

Registry structure and methods

Cancer registration in Birmingham dates to 1936. Originally based on a single hospital, its scope was gradually extended until by 1957 it included the whole region.

The WMCIU employs 23 staff in the cancer registration and data quality section. Four teams of tumour registrars and cancer registration clerks are responsible for processing the data received from NHS and private hospitals, nursing homes and hospices in a particular geographical area. Each team leader also has a specific area of responsibility; cancer registration, data quality, training and records management. The research and information team consists of 7 staff and the computing and automated cancer registration teams of 5 staff. A further 6 staff provide business, administrative and secretarial support. The WMCIU is funded, as are all English cancer registries, via top-sliced, earmarked funding from the Department of Health.

Cancer registration is not a legal requirement in the UK at present. However, regulations passed under section 60 of the Health and Social Care Act 2002 permit cancer registries to collect identifiable patient data assuming the implicit consent of the data subjects. Cases are mainly registered following receipt of information from clerical staff at individual hospitals in the form of relevant histopathology reports and clinical case notes, such as radiotherapy reports. Some hospitals send this information in electronic format as a single patient record. The information collected includes demographic details, tumour characteristics, details of the involved clinicians and hospitals, and the nature of treatment. Copies of death certificates are routinely received from the Office for National Statistics (ONS) for all cases mentioning cancer. If no further information is received after six months, additional details are sought from Primary Care Trust medical records departments (to whom all general practitioner records are returned after a patient's death) and hospitals are contacted to obtain relevant details. Non-cancer deaths are provided routinely by the National Health Service Central Register where all registered cancer patients are flagged. Active follow-up of patients is carried out for specific research studies (particularly survival studies that include extra-regional cases) but not routinely.

In 1994, the WMCIU's existing tumour-based records were converted to a patient-based system in which all patients have a unique identifier and individual patients can have several tumours each with a unique tumour number. This increased the ease and speed of registration and facilitated more complex validation and data-quality checks in line with IARC and ONS recommendations.

Use of the data

The WMCIU's database is used for routine data provision and for clinical audit and research purposes. Since 1995, data collected by the WMCIU have been used to assist in planning and monitoring the efficacy and cost-effectiveness of cancer services. The WMCIU is also involved in the EUROCARE study and contributes data to EUROCIM. The April 1996 incorporation of the NHS Breast and Cervical Screening Quality Assurance Services into the existing structure facilitated the synergistic combination of cancer registration and screening databases. The first major outcome of this has been the establishment of routine systems for obtaining breast and cervical cancer screening histories for all women

in the screening age band, including the determination of interval cancer and non-attender rates.

In 2001, the WMCIU launched the electronic Cancer Information Service (CIS), providing a powerful tool to enable health workers connected to the NHS Net to access cancer data from their own PC. Modules available include cancer incidence, mortality and survival data, analyses of cancer registration data quality and outcome measures relevant to the quality assurance of the NHS Breast and Cervical Screening Programmes. The WMCIU has a web site (www.wmpho.org.uk/wmciu/) from which general information on cancer incidence, mortality and survival can be obtained.

Source of population

Population estimates are based on the 2001 Census and built up from Census Area Statistical Wards. ONS estimates have been used to estimate the populations forwards and backwards to cover the period 1998–2002.

Multiple primary rules used

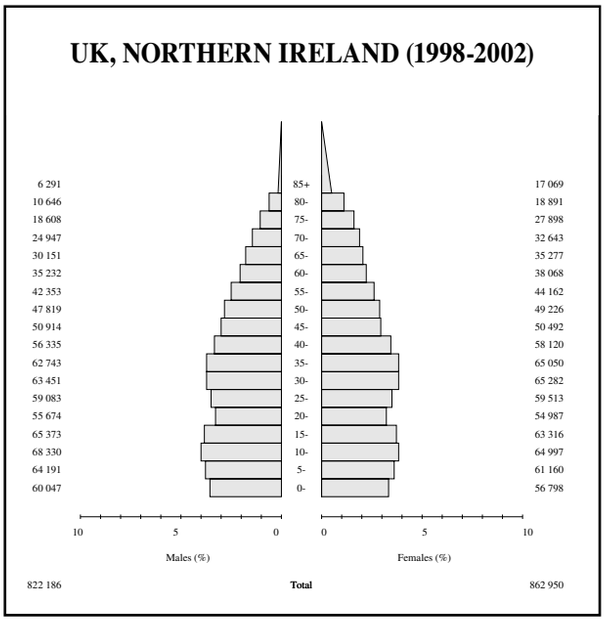
IACR rules (2004) on historical data.

UK, Northern Ireland

Registration Area

Northern Ireland consists of the six counties in the north of the island of Ireland and is part of the United Kingdom. The population of Northern Ireland was 1 689 319 at the last census year of 2001. Whereas most of the population is rural, there are two major urban areas situated around the cities of Belfast and Londonderry. Most of the heavy industry is located in the two urban areas. The population is relatively racially homogeneous with only a few small ethnic minorities, although there has been a recent influx of immigrants mainly from Eastern Europe.

The Northern Ireland Cancer Registry is a population-based registry that covers the entire population of Northern Ireland. Historically we have had high death rates from mesothelioma due to the shipbuilding industry in Belfast. In April 2007, a smoking ban was introduced into all work and public places.



Cancer care facilities

Most cancer patients are treated within the National Health Service system and even most private patients receive some of their treatment in National Health Service hospitals. Until 1 April 2007 there were 13 separate Hospital Trusts, which treat cancer patients amongst the four regional Health Boards. There is one radiotherapy department in the region, serving all cancer patients in the area. The vast majority of patients receive all their care within the region. A major re-organisation of cancer services in 1997 introduced the concept of a cancer centre and four cancer units for the population.

Registry structure and methods

The current N. Ireland Cancer Registry was established in 1994 to provide information on cancers in the Northern Ireland population for the purposes of research, education and the planning of services. The new registry, located in Queen's University Belfast, replaced an existing Department of Health and Social Services (DHSS) Registry that began in 1959. It is funded by an annual grant from the Department of Health with five yearly reviews to ensure quality and to advise on direction.

The registry uses an automated computer system with multiple sources of notification of patients with cancer. The Registry uses three main sources for registration, the Patient Administration System (PAS) used by all the Hospital Trusts, histopathology reports and death notifications. From PAS the registry obtains demographic information on individual patients along with data on their length of hospital stay and basic tumour site and behaviour information as an ICD-10 code. PAS information includes limited surgical treatment information. The tumour information is supplemented by electronic downloads from histopathology and cytopathology laboratories

The registry collects information on all neoplasms diagnosed in Northern Ireland. Some cancer-related conditions such as Barrett's oesophagus, hydatiform moles and CIN-I and CIN-II of the cervix are also recorded.

A major focus of the registry's operation work is on the verification of information from a single death certificate (death initiated cases), a single hospital admission or a single histopathology report. Registry staff examine practitioners notes for patients who have died from cancer. The staff also examines hospital records for cases identified without confirmatory histopathology or cytology. Histopathology reports are also checked for conflicting information or other possible errors.

The registry does not routinely receive tumour staging information but extracts some staging information from the written histopathology reports. Pathological staging is carried out by Registry staff on selected sites only—breast, colon, rectum, cervix, melanoma, bladder, testis and ovary. An electronic tool to facilitate clinicians staging cancer has been developed by the registry. Pilot studies indicate enhanced recording of stage. The Registry has piloted the capture of staging and other information at Multidisciplinary Team meetings, which discuss individual patient treatment plans and care.

The Registry has rigorous Quality Control and Quality Assurance programmes to ensure high levels of data completeness and accuracy. The Registry contributes annually to the UAKACR Quality Assurance Group to help monitor data quality issues. Additionally we routinely use the Flow Method for case ascertainment and yearly data re-abstraction to monitor data quality.

Interpreting the results

Population-based breast screening has been offered to all women aged 50–64 since 1993. The programme operates a three yearly recall system and was recently extended to include women up to the age of 70. Cervical screening has been available population-wide to all women over 20 since the late 1980s. PSA testing for prostate cancer has steadily risen since the early 1990s; however there are no formal guidelines at present to use this for population screening.

Use of the data

The registry not only registers all cancers in the region, but also provides a cancer information service and has a close connection with the breast and cervical screening services and the local cancer network. Registry data are routinely used by policymakers to evaluate and plan cancer services throughout the region. Registry reports on cancer survival, trends, cluster investigation and disease-specific audits are available at www.qub.ac.uk/nicr. The registry data on

Barrett's oesophagus and prostate cancer screening have formed the basis of research projects.

Source of population
2001 census. Northern Ireland Population census conducted on 29th April 2001. 1998, 1999, 2000, 2002: Mid Year population based on the results of the 1991 and 2001 censuses adjusted to take account of births, deaths and migration between Census Day and the Mid–Year date of 30th June.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

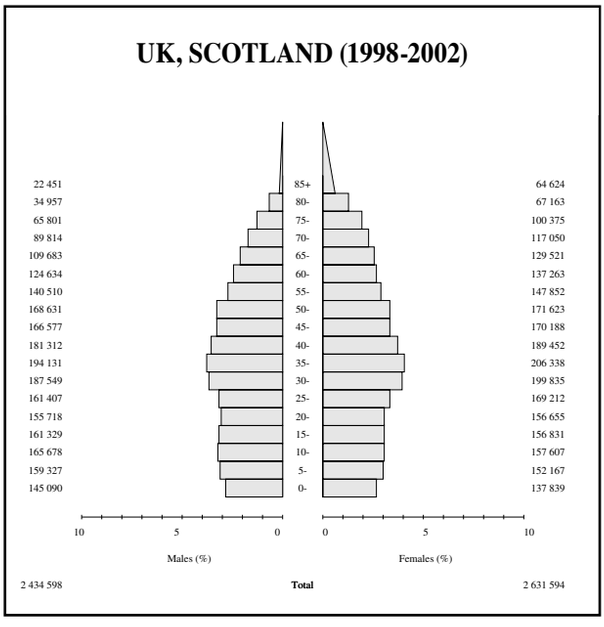
UK, Scotland

Registration area

The Scottish Cancer Registry covers the whole of Scotland, which has a population of just over five million. The majority of the population live in an industrialised belt across the centre of the country. The majority (87.15%) of the population were born in Scotland but 9.07% were born elsewhere in the United Kingdom (England, Wales, or Northern Ireland). A relatively small percentage (1.53%) were born elsewhere in Europe, and 2.25% in the rest of the world.

Cancer care facilities

The National Health Service in Scotland is funded mainly through taxation and is mostly free at the point of use. Access to hospital care is controlled by a well-developed system of primary care. Radiotherapy facilities are provided at five main centres (Inverness, Aberdeen, Dundee, Edinburgh, and Glasgow), but many patients with cancer are diagnosed and receive their primary therapy at district general hospitals. The private healthcare sector in Scotland is relatively small.



Registry structure and methods

The Scottish Cancer Registry forms part of the Information Services Division (ISD) of the National Health Service National Services Scotland (NHS NSS). The core registration function is funded by the Scottish Executive Health Department.

Until 1997, five regional cancer registries carried out registration, and the role of the national registry was limited to coordination, data collation, analysis and publication. In 1997, the national registry assumed responsibility for all aspects of registration and established a network of outposted, peripatetic cancer registration officers based in the main hospitals. Currently the registry is staffed by a medical director, a national coordinator, six central registry staff (two of whom work part-time), and 24 outposted staff (three of whom work part-time).

Cancer is not a notifiable disease in Scotland. Until 1997, the regional registries relied mainly on hospital inpatient sources, pathology records and death records to identify registrations. Since reorganisation, potential registrations are identified from four main computerised sources: hospital discharge records, oncology records, pathology records and death records. Information from these and other, non-computerised sources is linked to create provisional registrations that are made available to the outposted cancer information officers. By referring to medical records, the outposted staff validate the provisional registration and abstract additional information that cannot currently be collected electronically. The registry has an active programme of quality assurance.

Interpreting the results

The registry introduced ICD-10 and the second edition of ICD-O for diagnostic coding of patients diagnosed on or after 1 January 1997. Previously records were coded to ICD-9 and morphology to the first edition of ICD-O. The registry dataset was also expanded in 1997 to include most valid basis of diagnosis, method of first detection, grade of differentiation, stage of disease (for colorectal, female breast and cervix cancers), treatment details and entry to any clinical trial.

Cervical screening began in parts of Scotland in the early 1960s, but coverage was uneven until a computerised call-recall system was introduced in the late 1980s, offering cervical smears to eligible women in the age group 20–60 every three years. A national breast screening programme was phased in to Scotland in the late 1980s for all women aged 50–64 years every three years, and older women on demand. However, beginning in 2003/04, the age range for invitation was extended to include women up to the age of 70. In April 2000, in three (out of 15) Scottish health boards, a colorectal cancer screening pilot project was established to assess the feasibility of introducing a national screening programme based on offering faecal occult blood testing to individuals aged 50–69 every two years.

The prostate specific antigen (PSA) test was introduced to Scotland in 1989, and use of the test has increased strikingly since then. Although screening for prostate cancer is not currently recommended in Scotland, there is some evidence of differing thresholds for application of the PSA test since there is now considerable variation in incidence across the 15 Scottish health board areas despite much less variation in mortality.

In adults, the prevalence of smoking is estimated to have fallen from 46% in 1976 to 28% in 2002, although serious concerns remain about the prevalence of smoking among teenagers in Scotland. Alcohol consumption has increased greatly in Scotland since the 1950s. The diet in Scotland is widely regarded as unhealthy, and there is no evidence of any substantial change overall in fresh fruit or vegetable consumption since the early 1950s.

Use of the data

The Scottish Cancer Registry publishes data regularly on incidence, and periodically on survival. Increasingly, information is being made available on the internet (http://www.isdscotland.org/cancer). *Ad hoc* analyses of the data are carried out in response to many requests for information from a wide variety of data users. The Scottish Cancer Registry is involved in several major studies, both in-house and collaborative. The

registry data are used for a wide range of purposes including public health surveillance, needs assessment, planning and commissioning of cancer services, evaluating the impact of interventions on incidence and survival, clinical audit and health services research, epidemiological studies aimed at determining the causes of cancer, and providing information to support a range of functions including genetic counselling and health education.

Tasmania

Australian Capital Territory

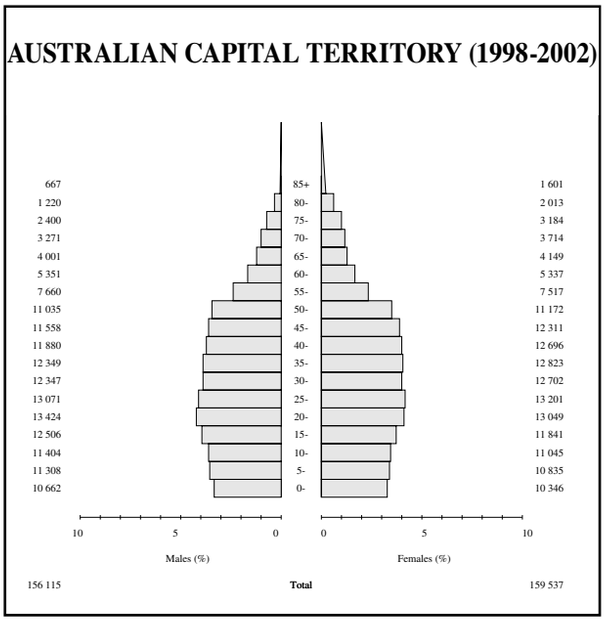
Registration area

The Australian Capital Territory (ACT) covers an area of approximately 2400 km^2 and is surrounded on all sides by the state of New South Wales (NSW). Almost all the ACT residents live in metropolitan Canberra, although 85% of the Territory's land mass is devoted to national park, nature reserves, pine plantations and properties. The population at the most recent census in 2001 was 311 947, which represents 1.6% of the Australian's population. The estimated median age in 2001 was 32 years.

Cancer care facilities

The ACT Health oversees general health care in the region in partnership with the service providers. The ACT has a comprehensive range of cancer prevention, early detection, treatment, community care and palliative services available to the local community, in both the public and private sectors. The Canberra Hospital is the principal cancer care provider in the ACT and surrounding NSW region, and offers expertise in surgery, medical and radiation oncology and haematology services. The Canberra Hospital is active in cancer research and clinical trials.

There is a strong network of consumer and carer support groups and the Cancer Council ACT is well supported by service providers and the ACT community.



Registry structure and methods

The cancer registry is the agency established under the Public Health (Cancer Reporting) Regulations gazetted in 1994, to receive notification of cancer in the ACT. Previously, the NSW Cancer Registry had been collecting data for the ACT since 1972, although notification was voluntary.

The ACT Health funds the registry, which is located at the Canberra Hospital in Woden in ACT. Since the regulations came into effect in July 1994, notification of malignant neoplasms has been mandatory for all ACT hospitals (public, private and day), radiotherapy departments, pathology laboratories, hospice facilities and nursing homes. Currently, data are received from 18 sources. These are all paper notifications, with the exception of the Department of Radiation Oncology at the Canberra Hospital and one private hospital in the ACT. The forms are collated and forwarded onto the NSW Cancer Registry, which processes all new cases of cancer for the ACT. Data on deaths from cancer is obtained from the ACT Registrar of Births, Deaths and Marriages.

Interpreting the results

Under the current arrangements, it is unlikely that any referred cases will be missed. Before 1994, voluntary reporting led to a dramatic under-reporting of cancer cases. Since 1994, the reporting of cancer cases has improved steadily to a level at or near 100%. For example, the age-standardised rate for malignant melanoma of the skin for males was 30.6 in the 1998-92 statistics, and 40.7 in the 1994–96 statistics.

Use of the data

The registry monitors the incidence and trends in cancer for ACT residents. With regard to the small numbers involved in the ACT cancer statistics, data on incidence and mortality are analysed in five-year blocks and reported every two years.

Record information is made available to approved medical researchers engaged in studies that are considered by the ACT Health Ethics Committee to be of importance to the community.

Source of population

1991, 1996 and 2001 are census populations, adjusted for under–enumeration and Australian residents temporarily overseas. The intercensal estimates are obtained from the previous census by advancing age and allowing for births, deaths and immigration. They are adjusted in the light of the succeeding census. Ref: Australian Bureau of Statistics. Population by age and sex: Australian States and Territories June 1992 to June 1997. ABS Catalogue no. 3201.0(1997) Canberra, Australian Bureau of Statistics.

Multiple primary rules used

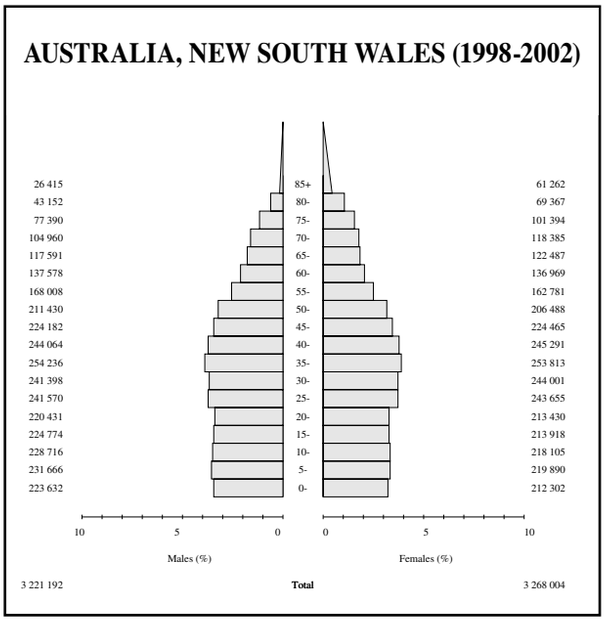
IACR rules (2004) on CI5 IX period.

Australia, New South Wales

Registration area
The NSW Central Cancer Registry covers the population of New South Wales. There were 6 686 644 residents in 2003; of these, two thirds live in the capital city, Sydney. NSW is the most populated of the six federated states, with 34% of the population of Australia. The area of NSW is 801 400 Km^2 (309 433 square miles), comprising 10.4% of the total area of Australia. Geographically, the Western Slopes of the Tablelands and the Western Plains occupy two thirds of the State, but most of the population lives in the east, with 74% living in the adjacent coastal cities of Sydney, Newcastle and Wollongong.

At 30 June 2003, 20% of the population was aged under 15 years of age, 67% between 15 and 65 and 13% 65 years and older. By comparison, in 1972, the first year of registration of cancer in New South Wales, 9% of the population was aged over 65 years.

In the 2001 Census, 4 450 772 people (70.5%) stated that they were Australian-born. This compares with 4 394 326 people (73.3%) in the 1996 Census and 4 284 568 (75.1%) in the 1991 Census.[1] The number of people born overseas in the 2001 Census was 1 474 987 (23.4%) compared with 1 388 849 (23.2%) in the 1996 Census and 1 286 847 (22.5%) in the 1991 Census. Of those born overseas, the three main countries of birth in the 2001 Census were the United Kingdom 275 130 (4.4%), New Zealand 105 708 (1.7%) and China (excludes Special Administrative Region and Taiwan Province) 85 363 (1.4%).



Cancer care facilities
There are 9 metropolitan and rural Area Health Services responsible for providing cancer services. These Area Health Services provide hospital inpatient, outpatient and community health care and specialist Cancer Care Centres for their residents. Radiotherapy and chemotherapy services are predominantly outpatient and provided in specialist Cancer Care Facilities. Cancer services are also provided by private facilities.

Notification of malignant neoplasms is a statutory requirement and currently operates under the authority of the Public Health Act of 1991. All public and private hospitals, departments of radiation oncology, nursing homes and pathology laboratories, outpatient departments and day procedure centres are required by law to notify the NSW Central Cancer Registry when cancer is diagnosed or treated by them.

Registry structure and methods
The NSW Central Cancer Registry is managed and funded by the NSW Cancer Institute on behalf of the NSW Health Department. There are 19 full-time-equivalent staff employed at the Registry. These include a manager, operations coordinator, coding supervisor, data quality manager, biostatistician, analyst programmer, medical adviser, medical coders and data entry clerks. The Registry maintains a register of cases of cancer diagnoses since 1972. The information collected includes name, address, date of birth, country of birth, clinical details about the cancer, the notifying institution and doctor. All information sent to the Registry is kept confidential, held under security and protected by the Public Health Act. Presently there is an initiative to develop clinical cancer registries to collect TNM staging and treatment information. These are being piloted in 5 of the 9 Area Health Services.

Forty percent of all notifications are received electronically; the remaining notifications and pathology reports are paper based. Death registrations are provided by the Registrar of Births, Deaths and Marriages and received regularly. Coded death registrations are also received from the Australia Bureau of Statistics. The Registry routinely matches cancer cases against deaths in Australia from all causes.

Interpreting the results
As notification is mandatory and provided through a number of different sources (on average, four notifications per case), the level of enumeration is likely to be high. Indicators of data quality support this assertion, with only 1.4% of cases registered as death certificate only and 88% of all cases histologically verified.

Use of the data
An annual statistical report is published that provides information on the number of new cases and deaths by counts, rates and trends over time. The Registry contributes to the prevention, planning, control and treatment of cancer in the population of NSW by providing timely accurate data and the evaluation of both breast and cervical screening programs. It contributes to national and international publications and a variety of specialist reports by cancer site. In addition, there are a number of other reports on specific cancer sites, risk factors and cancer survival in NSW in progress. Tabulated data is made available through a web based reporting module that can be accessed at www.statistics.cancerinstitute.org.au.

Unit record information is made available to approved medical researchers engaged in studies that are considered by the NSW Cancer Institute Ethics Committee and the Department of Health Ethics Committee to be of benefit to the wider community.

Source of population
Estimated resident population data – June 1998–2002.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

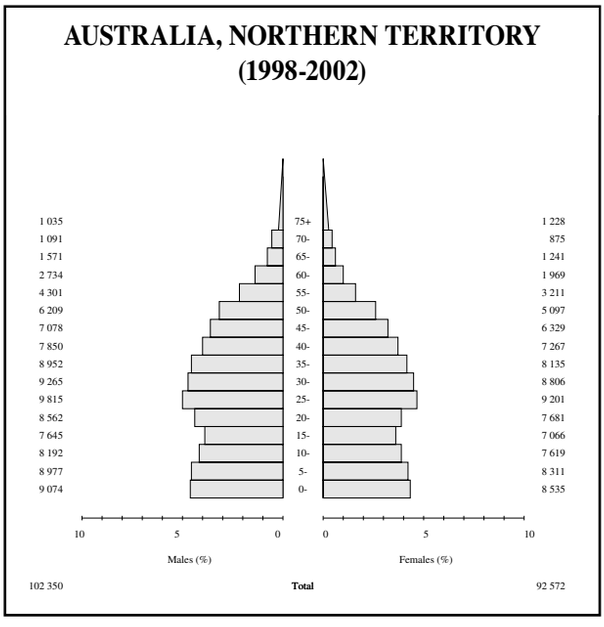
Australia, Northern Territory

Registration area
The Registry was established in 1981 to cover the entire population of the Northern Territory, a sparsely settled area of 1.4 million square kilometres in central and northern Australia. The population of the Northern Territory increased from 122 000 in 1981 to 203 000 in 2005. Seventy-five percent live in five urban areas.

The population has a very young age distribution, with only 5% of the population aged over 65 years, although the over-65 population is increasing at a faster rate than are younger age-groups. Twenty-nine percent of the population are Indigenous Australians, most of whom live in small, remote communities.

Cancer care facilities
There are six hospitals, including two referral hospitals, and a well-developed private health care system in the larger towns.

There has been some improvement in cancer diagnostic and treatment services since the establishment of the Registry. A breast cancer screening service commenced operation in 1994 and a cervical screening register in 1996. The extent of PSA testing is not known. A specialist medical oncologist commenced practice in the NT in 1991 and a haematologist in 2006, but other specialist oncology services are provided by visiting specialists from interstate; there is no specialist cancer treatment centre or radiotherapy facility.



Patients requiring treatment not available locally are transferred to specialist treatment centres in an interstate capital city. There is an extensive network of primary health care centres in remote communities.

Registry structure and methods
The Registry is located within and fully funded by the Health Gains Planning Branch of the state health department and staffed by one full-time research assistant. Data processing, coding and database maintenance are performed under contract by the South Australian Cancer Registry. Data analysis and publication are performed by Health Gains Planning Branch staff.

Notification of cases from the three pathology laboratories in the NT and the Registry of Births, Deaths and Marriages has been mandatory under the Cancer (Registration) Act since 1991. The Registry also performs active case detection from hospital inpatient morbidity data and follow-up from hospital medical records and medical practitioners for incomplete notifications.

Death registration in the NT is complete. The Hospital Morbidity Dataset is complete for the five public hospitals. There is a well-established system to exchange data with interstate cancer registries for cases notified in one state but resident in another at the time of diagnosis. There have been no substantial changes to case definitions or coding practices since 1991.

Interpreting the results
Prior to 1991, case ascertainment is estimated to have been only about 60% complete. A data quality audit of the register estimated that since 1991, case ascertainment has been less than 3% incomplete, in comparison with registration rates of other Australian registries. Incidence rates for Indigenous people under-estimate actual cancer incidence by approximately 18% because of mis-classification of indigenous status (Indigenous people incorrectly identified as non-Indigenous).

Indigenous Australians (Aborigines and Torres Strait Islanders) have a very different pattern of cancer incidence and survival at specific cancer sites than other Australians, with much higher incidence of some cancers but lower incidence of others, and lower cancer survival. Cancer incidence and mortality statistics are published separately for Indigenous and non-Indigenous people. Among Indigenous Australians, smoking prevalence is very high (over 50% of adults are current smokers), as is consumption of alcohol at dangerous levels; the prevalence of chronic infection with Hepatitis B virus is also high, but Pap test participation rates are relatively low. The prevalence of smoking and consumption of alcohol at dangerous levels is also higher among non-Indigenous people in the NT than for the total Australian population.

Use of the data
Because of the small number of cases registered each year, the registry produces statistical reports only every few years. The Registry participates in a small epidemiological research program focussing predominantly on issues relating to cancer in Indigenous Australians and performance of local cancer diagnosis and treatment services. In recent years Registry data have been increasingly used for health service planning purposes, particularly in consideration of the feasibility of establishing a radiation oncology service within the Northern Territory.

Source of population
Estimated Resident Population, based on five–years census. Australian Bureau of Statistics. 3228.0 – Demographic Estimates and Projections: Concepts, Sources and Methods, 1995. Catalogue No 3228.0. (available at http://www.abs.gov.au/AUSSTATS/abs@.nsf/DSSbyCollectionid/FCEF74DBECB94037CA256BD000274964).

Multiple primary rules used
IACR rules (1990 and 2000).

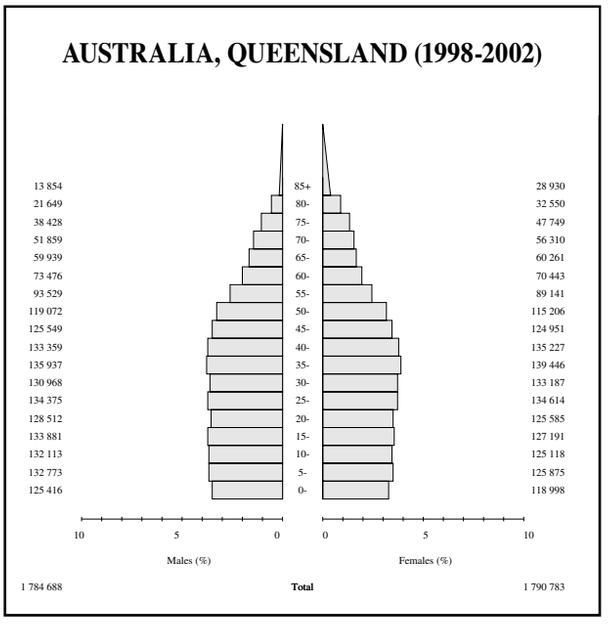
Australia, Queensland

Registration area
The Queensland Cancer Registry collects data relevant to the State of Queensland, which occupies the northeastern portion of the Australian continent. Queensland is the second-largest of the six Australian states and has the largest habitable area. Queensland boasts a subtropical to tropical climate.

The Queensland population of 3 522 044 (2001) is 19% of the total population of Australia. Queensland's population is the least centralised of all the mainland states of Australia.

Aboriginal and Torres Strait Islander people represent approximately 3.1% of the total population. Approximately 70% of the population are of Christian denomination.

Cancer care facilities
Specialist cancer treatment is primarily provided by the major Brisbane hospitals (Princess Alexandra Hospital, Mater Misericordiae Hospital, Royal Brisbane and Womens Hospitals and the Greenslopes and Wesley Private Hospitals) with large regional hospitals (e.g. Townsville and Rockhampton hospitals) also providing specialised treatment. In addition, some oncology specialists visit patients at regional centres. Radium treatment is available at Townsville and Brisbane.



Registry structure and methods
The registry is located at the Queensland Cancer Fund and is funded and managed by the Queensland Department of Health. The registry has a core of eight clinical coding staff as well as a number of temporary staff to undertake supplementary projects.

Data collection for the Queensland cancer Registry commenced on 1 January 1982. The registry operates under an Act of Parliament that requires compulsory notification of all cancer patients in Queensland to the registry from all hospitals (public, private, psychiatric) and nursing homes. In addition, it is compulsory for all pathology laboratories to provide pathology reports mentioning cancer to the registry. Death certificates are accessed where the cause of death is cancer and also for cancer patients dying of causes other than cancer.

Arrangements for completion of forms vary according to the type of hospital. Resident medical staff and medical records staff are involved in the larger hospitals, medical superintendents and nursing staff at smaller hospitals.

Interpreting the results
A number of new initiatives have been undertaken in recent years. Quality assurance reviews have been conducted on cause of death coding from the Australian Bureau of Statistics. A review comparing cancer notifications against the hospital morbidity collection has been conducted and indicated under-reporting. The registry is able to obtain access to electronic pathology reports for all public hospitals, and is currently working on accessing other pathology laboratory results electronically. Access to the electoral roll with date of birth has been gained, which assists in identifying patients still alive, and the registrar of births, death and marriages ahs introduced date of birth and indigenous identifier to the death certificates.

There is population-based, coordinated screening for breast and cervix, and about 30% of men older than 50 yrs have a PSA test in any specified year.

Use of the data
While the QCR doesn't undertake an epidemiological research itself, it does provide data for researchers wishing to undertake epidemiological research. Policy makers also use our cancer registry data for planning and evaluation of health services.

Source of population
Australian Bureau of Statistics. 2001 Census of Population and Housing, Selected Social and Housing Characteristics for Statistical local Areas 2015.3.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

Notes on the data
C44 does not include basal cell or squamous cell carcinoma.

South Australia

Registration area

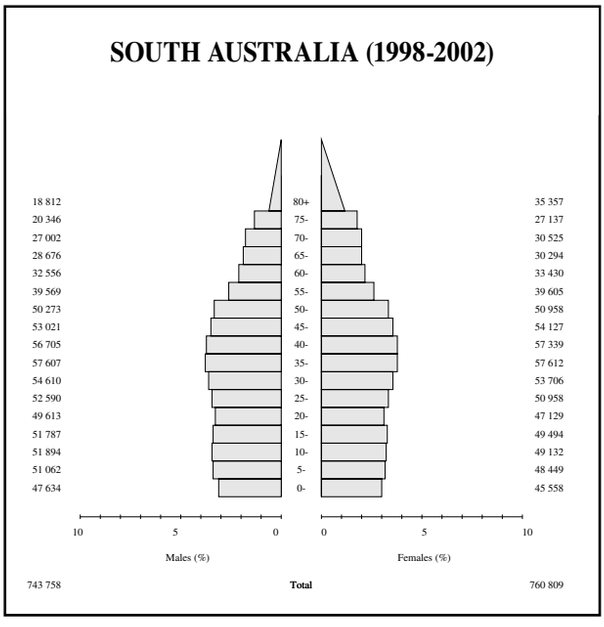
South Australia is a state in the Australian federation of six states and two territories. It is situated between 26° and 38°S and 129° and 141°E, and covers a total area of 984 375 km^2. Over one third of this area is desert, and over half of the state is devoted to extensive pastoral pursuits.

Approximately 99% of the population lives south of the 32nd parallel, and a high proportion of the population lives in or around the coastal state capital city, Adelaide.

South Australia has a multicultural population with increasing immigration from many overseas countries. The Cancer Registry records Country of Birth and Race (whether Caucasian, Indigenous, Asian or "Other").

Registry structure and methods

The South Australian Cancer Registry started in 1976, on a voluntary basis, but since 1977 notification of cancer has been a statutory obligation (without penalty) for all hospitals and pathology laboratories in South Australia. Hospitals are required to report all cases of cancer (expect non-melanotic skin cancers) within one calendar month of the patient's commencing radiotherapy, the patient's discharge from the hospital and/or death of the patient in the hospital. Pathology laboratories are required to send copies of reports of all cases of cancer within one calendar month of the finalisation of the pathology report.



Registry staff consists of a Manager and five cancer registry project officers.

The system of notification varies among hospitals depending on hospital size, staffing and types of record systems. In general, the responsibility lies with medical records officers in public hospitals and managers in private institutions. The multiple notifications received are linked and a file is created for each patient. Checks are available to the registry from death certifications and pathology reports. Cases from such sources that are not reported by hospitals are followed up.

Information collected includes country of birth, race, occupation, Breslow thickness and Clark level for melanoma and tumour diameter and nodal status for breast cancer.

The registry staff regularly telephone, visit or write all hospitals to obtain information on inadequately reported cases and cases identified from pathology laboratory reports. Patients' medical advisers may be consulted by letter or telephone if case discrepancies are not resolved by other means. An annual cross-linkage checks cancer registry live cases with the Registrar of Deaths' main deaths file to see whether any cancer cases have died of a condition other than cancer. Cancer deaths are detected on a monthly basis by electronically searching the current file of death certificates obtained from the Registrar of Births, Deaths and Marriages. Hospitals or treating medical advisers are consulted when a cancer death certificate is received for someone not already known to the registry. All Australian registries communicate regularly with each other about cases who have moved interstate.

Ascertainment checks to find unreported cases are performed at least every six months by comparing hospitals' inpatient separation data with the registry's files. An annual data validation check is performed in addition to the routine editing and validation procedures incorporated into the data entry software.

Since 1987, a system of hospital-based (clinical) registries has been established in major teaching hospitals in South Australia. Special liaisons have been established with the hospitals' departments to facilitate the follow-up of patients by clinicians and to enable them to evaluate clinical aspects such as treatment outcomes in relation to disease stage and important prognostic factors. The relevant clinical areas own these hospital-based registries, but significant interaction with the population-based registry is required for case ascertainment and data provision.

Use of the data

The primary objective of the registry is to describe the nature and extent of cancer in South Australia, to monitor cancer incidence, mortality and survival, and to evaluate spatial and sub-population differences. Registry publications on cancer in South Australia are current, timely and well-received locally, interstate and overseas.

The data are used extensively for monitoring the burden of cancer in the community and evaluating the effectiveness of cancer control and prevention programmes, for example breast and cervical cancer screening, and of clinical services. PSA testing is also common within the population. Other international, national and local bodies also use the data extensively for their cancer prevention, cancer control, clinical services and/or research activities. The Cancer Council South Australia is one local organisation that uses registry data heavily in its activities.

An analysis of survival has provided valuable information for the entire South Australian community, and has served as a standard comparison for intra-hospital survival studies. The data are now sufficient for ten-year relative survival rates to be calculated based on the proportion of survivors from 1977 in the patient group, as related to the proportion of survivors in a similar group of people without the disease.

Cancer registry data also are used in investigating perceived cancer clusters in various geographical areas.

These perceptions usually arise from a citizen or group of citizens concerned about their local environment.

Other cancer epidemiology and statistics endeavours are supported, such as the National Malignant Mesothelioma Project, National Paediatric Cancer Registry, the National Cancer Statistics Clearing House and various *ad hoc* international, national and local projects.

Source of population

The mid–year 2000 population was estimated by the Australian Bureau of Statistics, based on the 1996 census, and advancing age and allowing for migration, births and deaths.

Multiple primary rules used

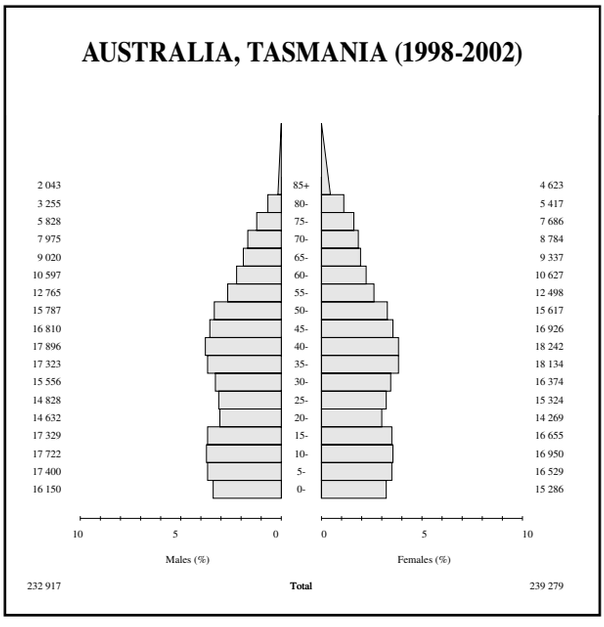
IACR rules (2004) on CI5 IX period.

Australia, Tasmania

Registration area

Tasmania, the smallest state of Australia, is a group of islands of 68 114 km^2, about 0.9% of the total area of Australia, lying between 40° and 43°S, and having a temperate climate. The principal industries are aquaculture, viticulture, mining and forestry. Secondary industries include textile, confectionery, beer and beverages, zinc and aluminium smelters, and vegetable and milk processing. Tourism is also a major industry in Tasmania. Waterpower stations provide nearly all the electricity generated in the state. Wood fires used for home heating produce smoke in populated areas during the winter. A degree of heavy metal pollution of river waters occurs in some areas.

Only 2.5% of Australia's population reside in Tasmania. Tasmania is the most decentralised state in Australia, with almost 60% of people living outside the capital city statistical division. Like the national population, that of Tasmania is ageing with an increasing proportion of the population aged 65 years and over. Tasmania is the least diverse population in multicultural terms of all the states in Australia with 95.5% of the population born in Australia, the USA, the UK, New Zealand and South Africa. Three percent of the population are of indigenous origin.



Cancer care facilities

Tasmania is well served by oncology services. The three main population regions all have a public hospital system as well as a number of private hospitals. There are two radiation oncology units in the state.

Registry structure and methods

The Tasmanian Cancer Registry was established in 1977 as a population-based registry covering the state. The registry was set up for the purpose of providing the state government with accurate cancer incidence and mortality statistics and to provide the capacity to monitor cancer trends. In July 1988 the responsibility for the operation of the cancer registry was transferred from the Department of Health and Human Services to the Menzies Research Institute, University of Tasmania, Hobart.

Cancers were proclaimed as notifiable diseases in December 1992, and since then cancer has had a legislative basis. The registry is assisted by an Advisory Committee. The registry staff currently comprises a director, manager, two medical coders and a clerical assistant.

All the pathology laboratories in the State send the registry copies of histopathology, cytology and cell marker reports of cancer. Notification of cancer forms are supplied by the two radiation oncology clinics. Private and public hospitals notify diagnoses of cancer to the registry upon discharge of patients or provide a computerised listing of cancer cases periodically by electronic transfer. Death certificates of Tasmanian people are reviewed for mention of cancer as a cause of death. Since 1994 breast and cervix cancer screening programs have been undertaken in Tasmania, and listings from these sources are available to check against registry records. In the 1990s, the increase in the incidence of prostate cancer coincided with a greater use of PSA testing. Incidence peaked in 1995 before declining. Interstate registries supply data to the Tasmanian Cancer Registry on Tasmania residents who seek treatment interstate or who move interstate at some time after cancer diagnosis.

The Tasmanian Cancer Registry collects and registers non-melanoma skin cancers (NMSC) on a register established in 2001 for this purpose. Currently NMSC registrations are complete from 1978 to 2004.

To help achieve high data quality and case ascertainment, data are obtained from multiple sources including pathology laboratories, hospitals and the Registrar of Births, Deaths and Marriages. Most registered cases include data from both a pathology laboratory and a hospital service (inpatient or radiation oncology clinic). Where information received is insufficient to enable complete registration, active follow-up is undertaken by contacting treating doctors, pathology laboratories and medical records departments. In addition, the National Cancer Statistics Clearing House (NCSCH) in the national capital, Canberra, collates all State and Territory data and checks for duplicate registrations across two or more States.

Prior to the year 2000 cases were not accepted by the registry on the basis of death certificate only. Each death certificate is actively followed up to ascertain the time and place of diagnosis and to verify the diagnosis, and the percentage of death certificate only cases registered since 2000 is 1% per annum.

Use of the data

The registry publishes a report each year showing the number of new cases of cancer in Tasmania, and each cancer registry in Australia sends information to the NCSCH which publishes a national report. More detailed information is made available to the State Government healthcare institutions, healthcare professionals and health researchers to plan cancer education, treatment and research. In ethically approved research projects, identified data from the cancer registry may be released to researchers.

Source of population

1996 and 2001 are Census populations, adjusted for under–enumeration and Australian residents temporarily overseas. The intercensal estimates are obtained from the previous census by advancing age and allowing for births,

deaths and migration. They are adjusted in the light of the succeeding census. Ref.: Australian Demographic Statistics, Australian Bureau of Statistics, Cat. No. 3101.0, Dec. 1996–2001. Allen DN, Tasmanian Year Book 1996, Australian Bureau of Statistics, Cat. No. 3101.6, 1996.

Multiple primary rules used
IACR rules (2004) on historical data.

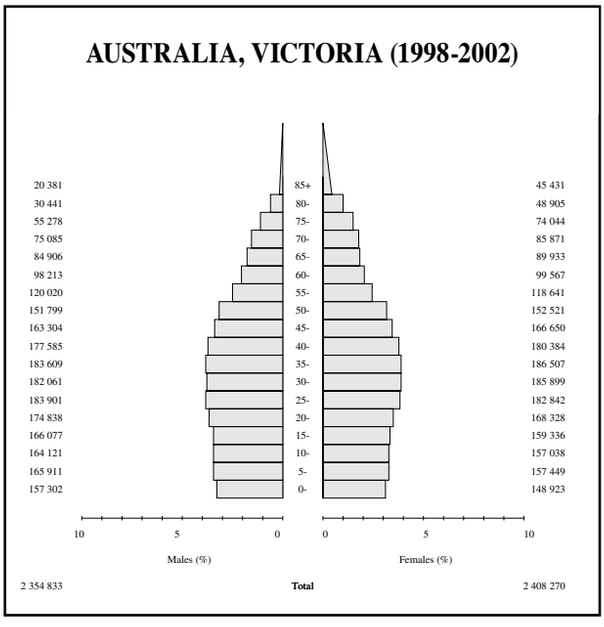
Notes on the data
C44 not available.

Australia, Victoria

Registration area

The Victorian Cancer Registry covers the State of Victoria, the second most populous State in the Australian Commonwealth, situated in the southeastern corner of the continent and bounded to the north by New South Wales and to the west by South Australia. The estimated population in 2004 comprised 4 962 970 persons, of whom 19% were under 15 years and 13% were aged 65 years or more. One in four Australians lives in Victoria, and almost three quarters of these live in the Melbourne Metropolitan Area with most of the remainder in small provincial cities. The average population density is 22 persons/km^2, ranging from <2 in the Wimmera to over 400 in Melbourne.

Since the registry's inception in 1982, the population has both grown and aged, and the mix of immigrants has altered from predominantly European to growing numbers from Asia, South America and Africa. The newest migrant groups tend to be younger and, therefore, contribute little to cancer incidence. At the 2001 census, 24% of the population was described as being overseas born. Of these 1 080 344 persons, 15% were from the United Kingdom, 4% from New Zealand, 7% from Italy, 4% from Greece, and 4% from Vietnam. The remainder originated in China, India, Sri Lanka, Malaysia, Germany, former Yugoslavia and other European countries, and small numbers from Asia, South America, Africa and Oceania. Almost 70% of Victorians were Christians (28% Catholic) with less than 1% each of Muslim, Jewish, Buddhist, Hindu and other religious denominations; one third stated no religion.



Because of its low latitude and highly susceptible population Victoria has a high incidence of skin cancers. No other cancer risk factors are particularly prominent; smoking has long been in decline but obesity is increasing.

Cancer care facilities

Victoria's medical care system is a mix of private and public sectors. In 2003–4 it had a well-established system of 144 public hospitals with several specialist oncology units including Radiation Oncology centres, and one large hospital dedicated to cancer treatment, for a total of 11 950 public hospital beds. In addition there were 135 private hospitals containing 6674 beds. A mix of public hospital departments and private laboratories provided pathology services. In the last two decades there has been some de-centralisation of treatment services, especially radiotherapy.

Victoria has organised screening programmes for breast and cervical cancer and bowel cancer screening is being introduced. Since the early 1990s the use of the PSA test has become widespread, though this is not supported by cancer agencies or the government.

Registry structure and methods

The Victorian Cancer Registry was established in 1940 by the Anti-Cancer Council of Victoria (as it was then known). Since legislation was passed in December 1982, cancer notification has been compulsory for all hospitals and pathology laboratories in Victoria, and fully population-based coverage was achieved in 1982. The registry is central to Cancer Council Victoria's cancer control programme, and is housed in its Cancer Control Research Institute in Melbourne. The registry is also funded by the Department of Human Services, Victoria. The Registry has a staff of 20: medical coders and clerical staff, a consultant pathologist, registrar and deputy registrar, director, information manager and administrative support from the Cancer Epidemiology Centre.

The registry is largely a passive notification system, receiving reports from around 250 hospitals and 50 pathology labs in Victoria and exchanging non-resident data with neighbouring states. Hospital data are received on handwritten forms, computer printouts or increasingly in electronic format. Notifications from pathologists are usually full copies of pathology reports in computer readable format. Over 70 000 notifications are processed for each year of incidence data. Other data sources include details of all death certificates supplied on magnetic tape by the Registrar of Births, Deaths and Marriages. Some active follow-up is pursued for cases in specialist sub-registers e.g. for *in-situ* and small invasive breast cancers, CNS neoplasms, childhood cancers, and prostate cancers.

The Victorian Cancer Registry adheres to IACR definition and coding recommendations; all data from 1982 have been recoded according to IACR rules. Data are rigorously computer-checked for validity and consistency, and routine checks are regularly conducted on the entire file. Data quality is assured by matching pathology reports with hospital registrations for cases where diagnosis was based on histological confirmation. There are no plans for a formal review of completeness or accuracy. Periodic record linkage with other administrative databases has confirmed virtually complete casefinding. For death certificate only registrations, correspondence is sent to the signatory doctor to confirm diagnosis. The registry only contacts patients directly within the context of research study recruitment.

Use of the data

The registry produces regular statistical reports and overviews of its accumulated data. It also produces a regular pamphlet, CANSTAT, a topical epidemiological digest of cancer facts and figures. Registry data are used to assess the extent of the cancer epidemic and to monitor trends, particularly in

cancers targeted by prevention programs (skin, lung, breast and cervix). The registry also facilitates cancer management surveys by identifying random samples of patients and sending their treating doctors questionnaires regarding care patterns. Cancers surveyed in this way have included breast, bowel, prostate, lung, and testis, rectum, ovary and bladder. One of the registry's most important functions is to facilitate epidemiological research. In addition to epidemiological analysis of registry data, the registry is used to follow up cancer events in cohort studies, to identify cases for case-control studies, and to confirm cancer occurrence in population-based studies.

Multiple primary rules used
IACR rules (2004) on CI5 IX period.

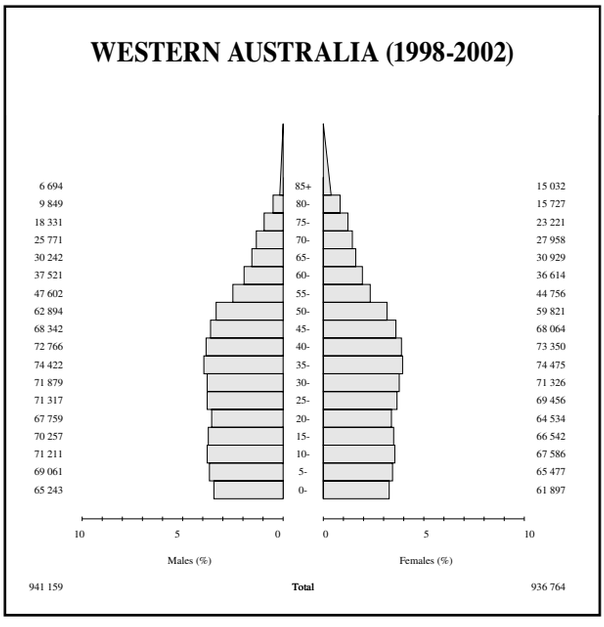
Western Australia

Registration area

The Western Australian population of is approximately 10% of the total population of Australia. Western Australia now has a high proportion of migrant inhabitants; 69% of the population were born in Australia, 22% in New Zealand, and 18% in Europe (including the UK). Approximately 3% of the population are Aboriginals, for whom life expectancy is on average between 15 and 20 years less than for non-Aboriginal persons.

The Registry covers the entire State of Western Australia, an area of 2 525 500 km^2, almost one third of the total area of Australia. The State lies between latitude 13º and 35ºS and longitude 113º and 129ºE and extends approximately 2400 km from north to south. The northern third of the State lies within the tropics where desert or near-desert conditions prevail over some 900 000 km^2 and population density is sparse. Population distribution overall is extremely uneven; 73% of the population live in the capital city Perth, in the south of the State

The State's economy has diversified, and it is now a leading producer of several key minerals. Heavy manufacturing is relatively insignificant, but light manufacturing is widespread. Air pollution has not been a major problem in Western Australia; however, there has been increasing public concern over the possible effects of industry, to which the Cancer Registry has had to devote significant time in recent years.



Cancer care facilities

Cancer therapy is concentrated in the Perth metropolitan area, the major (government-operated) teaching hospitals and several private clinics acting as referral centres for country areas.

Registry structure and methods

Reporting of cancer in Western Australia became a statutory obligation in August 1981 with the establishment of the population-based Western Australian Cancer Registry. Notifications are received from pathologists and radiation oncologists. Scope includes all malignancies and *in situ* neoplasms other than primary cutaneous BCC and SCC, and includes benign CNS tumours.

The WACR has the equivalent of 6 full-time staff who handle preparation, linkage, coding and entry of data, as well as administrative and statistical reporting functions. A detailed statistical report is produced each year and includes incidence and mortality rates and "most common cancer types" data, while other analyses such as survival and geographic-area analysis are periodically included.

Registry staff have access to medical records departments of major public hospitals to allow collection of additional data when necessary; enquiries are also made of private pathology laboratories and medical practitioners in case of need. Mortality information is routinely searched for outcomes of known cases, and additional cases are recorded—then subjected to the routine enquiry process—when a death certificate indicates a cancer in an individual previously unknown to the Registry. Search and matching routines are now fully computerised.

For selected cancers, additional data (such as level and depth for melanomas) are stored in linked data files. The database is a relational structure consisting of individual linked Dbase3+ files controlled by a locally-developed program using the Clipper5 compiler.

There are 4 hospital-based cancer registries in Western Australia that collect additional data concerning cancer stage and treatment, and regularly exchange information with the central Registry and hospital registries. This enhances the completeness of WACR data, and provides hospital teams with outcome (survival) information.

Interpreting the results

In Western Australian women, around 54% of the target population (50–69 years) are screened for breast cancer and 61% of the target population (20–69) undergo routine Pap smears to detect cervical cancer. Screening for other specific diseases is at present reserved for high-risk families.

Within WACR, data quality is assessed in various ways. For completeness of data, the mortality to incidence ratio is a reasonable indicator and for the 2004 data were 0.33 for males and 0.30 for females. The IARC rules for flagging of non-reportable "multiple primary" tumours are incorporated in the Registry software (recently updated to the current ICDO-3 rules).

Processing of death information has a special status—at the time of death data linkage, each case is reviewed for compatibility of incidence and mortality data, cause of death is coded by registry staff, and letters are sent to doctors or hospitals to resolve outstanding questions. The Registry records cause and date of death when notified of events outside our jurisdiction, so as to facilitate accurate survival analysis and prevalence studies.

Use of the data

The WACR maintains a comprehensive statistical analysis tool for response to queries, based on a statistical extract which can be updated periodically. Population files are maintained to serve the Department of health administrative boundaries, and a choice of "standard population" weightings is available to meet the needs of both local and International communities.

Data from the WA Cancer Registry are used in a wide variety of research projects, many of which include the contacting of individual persons on behalf of researchers. Use of named data for such purposes is strictly controlled, and the increasing use of Registry data for research purposes is encouraged. The staff support the view that the value of the Registry lies mainly in its being used.

Source of population
The estimate of the population–at–risk is based on Australian censuses and Australian Bureau of Statistics inter–censal estimates, making allowance for births and deaths, and migration into and out of the registration area.

Multiple primary rules used
IACR rules (2004) on historical data.

French Polynesia

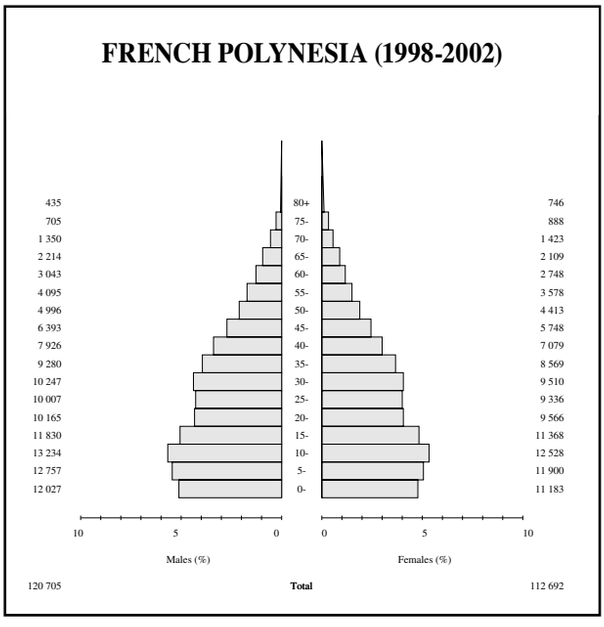
Registration area

The registry covers all of the islands of French Polynesia, i.e. 118 main islands distributed over 5 archipelagos, corresponding to a total of 4000 km^2 land area, but spread over an area of ocean the size of Europe.

Seventy-five per cent of the 244 830 inhabitants (Nov. 2002 population census) live on the island of Tahiti, where Papeete is the only real town of the area. The population is young: 40% are aged less than 20 years. In 2002, the birth rate was 19.6%; during the same period, the crude mortality rate was 4.6%, and 6.7% for child mortality.

Census data for 1988 show the following ethnic distribution (information on ethnic groups has no longer been collected after that date): Polynesian and related groups 83%, European and related groups 12%, and Asian and related groups 4%.

The majority of the population is of Christian denominations, mostly Protestant. In 2002, the economically active rate was 58%.



Cancer care facilities

Health care in French Polynesia is characterised by the co-existence of an important public sector and a free enterprise sector that has greatly increased over the past 10 years.

Healthcare expenses have been evaluated to 420 million euros. Since 1995, all Polynesians have had social healthcare coverage. Moreover, an interaction between preventive and medical care, the improvement of lifestyle and education, and the development of public structures such as drinking-water networks and wastewater treatment have improved the level of health indicators, despite the important rise of diseases linked to lifestyle (diabetes, obesity).

The Polynesian health system on Tahiti Island has one well-equipped university hospital centre with 436 beds, 2 private clinics, one secondary hospital, administered by the Health Directorate, with 44 beds for medico-obstetrics, public community clinics also administered by the Health Directorate and one growing free-enterprise sector with 193 physicians (as at 1 Jan 2007), corresponding to 114 per 100 000 inhabitants in Tahiti.

The global healthcare distribution currently (2007) is of 282 physicians per 100 000 inhabitants in Tahiti, and of 234 per 100 000 over the whole country, the actual distribution being very uneven (84% work on the island of Tahiti).

In addition to the above there are 7 specialised medical clinic departments combining care and prevention: Hygiene and Public Health, Mothers Care, Child Care, School Health, Dental care, Child and Youth Psychiatry, and Alcohol and Drug Addiction.

Registry structure and methods

The 8th Regional Conference of South Pacific Commission Health Directors organised in 1979 in Apia (Western Samoa) recommended the establishment of a cancer registry in each country of the region. To date, only two island countries have such a registry: Papua New Guinea (since 1958) and Fiji (since 1965). French Polynesia, as well as American Samoa and New Caledonia, immediately showed interest in having a common notification system for cancer cases. Other countries of the region have since adhered to this proposal.

Data collection started in French Polynesia in 1981, with the technical assistance of the South Pacific Commission, UCLA and the University of Hawaii Cancer Research Institute.

The cancer registry of French Polynesia is not an administrative independent body: it is managed by the Health Directorate, under the administrative responsibility of the Director.

Sources of cancer data include: Physicians voluntary notifications, pathology reports from the three existing laboratories, cytology reports from the biology laboratories, the computerised medical systems (PMSI) of the French Polynesia University Hospital Centre and private clinics, death certificates and the registry of repatriation towards France or New Zealand and the long-diseases registry of the Social Security system.

Some physicians are often reluctant to reveal the names of their cancer patients. However, follow-up of identified cases has improved thanks to the above PMSI.

Data is coded according to Version 3 of the WHO International Classification of Diseases for Oncology. A patient with two distinct tumours will be entered twice. The crude registry data are analysed on a yearly basis (number of cases declared and distribution). A 5-year synthesis is performed regularly.

Interpreting the data

Cancer currently is the second-leading cause of death in Polynesia (23% of certified deaths), following cardiovascular diseases. In the majority of cases, cancer treatment leads to medical repatriation towards France or New Zealand, once the diagnosis has been confirmed by one of the of the country's three pathology laboratories. Only basic chemotherapy protocols and surgery of some tumours take place locally.

Use of the data

The registry's current task is limited to basic descriptive analysis of the distribution by sex and age of the main cancer incidence in French Polynesia.

Multiple primary rules used
IACR rules (1990).

New Zealand

Registration area

New Zealand is situated in the South Pacific Ocean, 1600 km southeast of Australia. It is a long mountainous country surrounded by a large expanse of ocean, and consists of two main land masses: the North Island and the South Island. The total land area (including offshore islands) is 270 534 km^2. In 2001, 75% of the population lived in the North Island, and more than 30% of the population lived in the Auckland region. New Zealand is one of the most urbanised countries in the world—approximately 85% of New Zealand's 2001 Census usual population count lived in an urban area.

In 2001, 80% of New Zealanders identified as European and 14.7% identified as Maori. The other main ethnic groups were Asian (6.6%) and Pacific Peoples (6.5%).

Cancer care facilities

Cancer care in New Zealand is predominantly state-funded, supplemented by private hospitals and private practitioners. Cancer surgery and chemotherapy services are provided in the main centres of population; there are six radiotherapy centres.

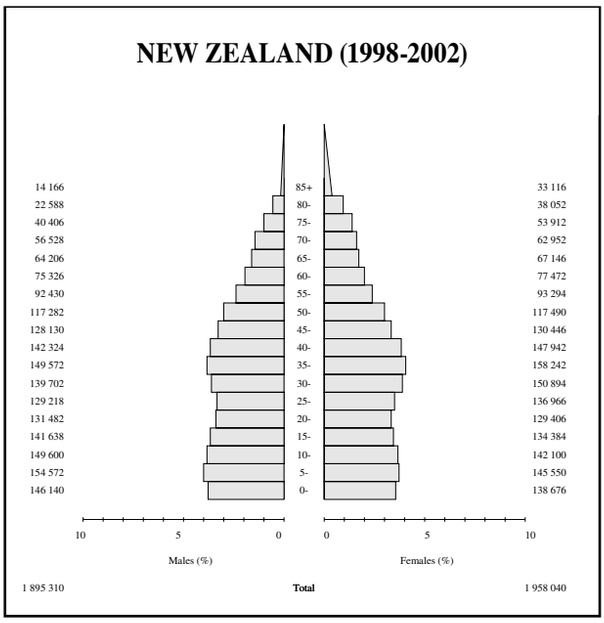
Registry structure and methods

The New Zealand Cancer Registry is located in the New Zealand Health Information Service (NZHIS), which is a unit of the New Zealand Ministry of Health in Wellington. The registry has operated since 1948. The New Zealand Cancer Registry is staffed by seven clinical coders and two support staff. Honorary consultants include pathologists, epidemiologists and oncologists.

Since 1994, laboratories have been the primary source of cancer notifications to the New Zealand Cancer Registry. Laboratories are required by law to report any new diagnosis of cancer in New Zealand, excluding squamous and basal cell skin cancers. Additional data sources include Medical Certificates of Causes of Death, Coroners' Findings, and public and private hospital discharge data received in electronic form.

All cancer registrations are coded by registry staff. Quality control procedures include computerised validation checks at data input, and rigorous edit checks on pre-publication incidence data.

The New Zealand Cancer Registry carries out internal and external audits from time to time. We last had a review by an external auditor in 2005.



Use of the data

Cancer registry data are used to monitor the burden of disease and to assess the impact of screening programmes, and as a resource for cancer research. The New Zealand Health Information Service produces an annual cancer publication containing information about cancer incidence and trends. The registry provides data for epidemiological research and identifies cases for ethics-approved case-control studies. Cancer registry data is also used by Genetics Services centres to assist in identifying familial cancers. Policymakers use our cancer registry data for planning and evaluation of health services.

Source of population

Annual estimates of the "usually resident population" supplied by Statistics New Zealand, based on a five–yearly census and taking into account births, deaths and migration.

Multiple primary rules used

IACR rules (2004) on CI5 IX period.

USA, Hawaii

Registration area
The Hawai'i Tumor Registry (HTR) is an active cancer surveillance monitoring system for the entire US state of Hawai'i, consisting of 8 major and 124 minor islands, covering 1367 miles from tip to tip. The resident population in 2005 was approximately 1 275 000, with the majority of residents living on the island of O'ahu.

Cancer care facilities
As the central statewide collection point for cancer data, the HTR receives data from collaborating hospitals maintaining their own hospital-based Tumor Registries. HTR staff also gathers data from other facilities, in addition to cases from oncology clinics, pathology labs, private physicians and radiation oncology facilities. The HTR database currently contains 137 591 reportable resident cases.

Registry structure and methods
The Hawai'i Tumor Registry (HTR) maintains a database of information on all cases of cancer diagnosed in the State of Hawai'i. It provides complete cancer reporting for the entire state and serves as a resource for nearly all epidemiologic cancer research and cancer control activities in Hawai'i. HTR collects the required SEER demographic and diagnostic items for all malignancies diagnosed in the state. Patients are followed annually during their lifetime. To ensure accuracy, strict quality control and assurance procedures have been established.

The HTR was established in 1960 by the Hawai'i Medical Association (HMA), the Hawai'i State Department of Health (DOH) and the Hawai'i Pacific Division of the American Cancer Society (ACS). Presently, HTR is jointly operated by the Cancer Research Center of Hawai'i and DOH, and became a member of the National Cancer Institute, Surveillance, Epidemiology and End Results (NCI/SEER) program in 1973. HTR has received its primary financial support from the National Cancer Institute through its Surveillance, Epidemiology and End Results (NCI/SEER) Program, with additional funding from a DOH fee-for-service contract.

Interpreting the results
In its years of operation, HTR has been a major source of cancer data and information, locally, nationally and internationally. HTR data collected for diagnosis years 1973–2003 are complete. There is some difference in incidence rates between males and females and among several ethnic groups. Hawai'i is unique in that its population is racially diverse, with no one ethnicity in the majority.

Use of the data
Hawai'i statistics on a wide variety of malignancies are available to the research community world wide. The most recently available statistical publication, *Hawai'i Cancer Facts & Figures 2003-2004*, is available for download at http://www.crch.org/Cancer0304.pdf. The publication provides an overview of cancer, a discussion of the impact of gender and age and racial/ethnic disparities in cancer, and an analysis of six major cancer sites by race/ethnicity.
